**Adhesive Bandage**

» Adhesive Bandage consists of a compress of four layers of Type I Absorbent Gauze, or other suitable material, affixed to a film or fabric coated with a pressure-sensitive adhesive substance. It is sterile. The compress may contain a suitable antimicrobial agent and may contain one or more suitable colors. The adhesive surface is protected by a suitable removable covering.

**Packaging and storage**—Package Adhesive Bandage that does not exceed 15 cm (6 inches) in width individually in such manner that sterility is maintained until the individual package is opened. Package individual packages in a second protective container.

**Labeling**—The label of the second protective container bears a statement that the contents may not be sterile if the individual package has been damaged or previously opened, and it bears the names of any added antimicrobial agents. Each individual package is labeled to indicate the dimensions of the compress and the name of the manufacturer, packer, or distributor, and each protective container indicates also the address of the manufacturer, packer, or distributor.

**Sterility <71>:** meets the requirements.

## Gauze Bandage

» Gauze Bandage is Type I Absorbent Gauze. Its length is not less than 98.0 percent of that declared on the label, and its average width is not more than 1.6 mm less than the declared width. It contains no dye or other additives.

**Packaging and storage**—Gauze Bandage that has been rendered sterile is so packaged that the sterility of the contents of the package is maintained until the package is opened for use.

**Labeling**—The width and length of the Bandage, the number of pieces contained, and the name of the manufacturer, packer, or distributor, are stated on the package. The designation “non-sterilized” or “not sterilized” appears prominently on the package unless the Gauze Bandage has been rendered sterile, in which case it may be labeled to indicate that it is sterile and that the contents may not be sterile if the package bears evidence of damage or if the package has been previously opened.

**NOTE**—Before determining the thread count, dimensions, and weight, hold the Bandage, unrolled, for not less than 4 hours in a standard atmosphere of  $65 \pm 2\%$  relative humidity at  $21 \pm 1.1^\circ \text{C}$  ( $70 \pm 2^\circ \text{F}$ ).

**Thread count**—Count the number of warp and filling threads of it in areas of 1.27 cm ( $1/2$  inch) square at 5 points evenly spread along the center line of the Bandage, no point being within 30.5 cm (12 inches) of either end of the Bandage, and calculate the average number of threads per 2.54 cm (1 inch) in each direction. A variation of not more than 3 threads per inch is allowed in either warp or filling, provided that the combined variations do not exceed 5 threads per square inch.

**Width**—Measure its width at each of the 5 points selected for the determination of the thread count: the average of 5 measurements is not more than 1.6 mm ( $1/16$  inch) less than the labeled width of the Bandage.

**Length**—Measure the length of the unrolled Gauze Bandage, smoothed without tension, along the center line of the Gauze Bandage: the length is not less than 98.0% of the labeled length of the Bandage.

**Weight**—Weigh the entire Bandage: the calculated weight in g per 0.894 square meter (1 linear yard *Type I gauze*), using the measurements obtained as described in the two paragraphs just preceding, is not less than 39.2 g.

**Absorbency**—Hold a rolled Gauze Bandage horizontal to and almost in contact with the surface of water at  $25^\circ$ , and allow it to drop lightly upon the water: complete submersion takes place in not more than 30 seconds.

**Sterility** (71): Gauze Bandage that has been rendered sterile meets the requirements.

**Other requirements**—It meets the requirements of the tests for *Ignited residue*, *Acid or alkali*, and *Dextrin or starch*, in *water extract*, *Residue on ignition*, *Fatty matter*, and *Alcohol-soluble dyes* under *Absorbent Gauze*.

## Barium Hydroxide Lime

### DEFINITION

Barium Hydroxide Lime is a mixture of barium hydroxide octahydrate and Calcium Hydroxide. It may also contain Potassium Hydroxide and may contain an indicator that is inert toward anesthetic gases such as Ether, Cyclopropane, and Nitrous Oxide and that changes color when

the Barium Hydroxide Lime no longer can absorb carbon dioxide.

[**CAUTION**—Because Barium Hydroxide Lime contains a soluble form of barium, it is toxic if swallowed.]

### IDENTIFICATION

- **A.** **Analysis:** Place a granule of it on a piece of moistened red litmus paper.  
**Acceptance criteria:** The paper turns blue immediately.
- **B. IDENTIFICATION TESTS—GENERAL, Barium, Calcium, and Potassium (191)**  
**Sample solution:** 100 mg/mL in 6 N acetic acid  
**Acceptance criteria:** Meets the requirements for *Barium* and for *Calcium*, and it may meet the requirement of the flame test for *Potassium*.

### SPECIFIC TESTS

- **PARTICLE SIZE DISTRIBUTION ESTIMATION BY ANALYTICAL SIEVING (786)**  
**Sample:** 100 g  
**Analysis:** Screen the *Sample* for 5 min as directed in the chapter, using a mechanical shaker.  
**Acceptance criteria:** It passes completely through a No. 2 standard-mesh sieve, and NMT 2.0% passes through a No. 40 standard-mesh sieve. NMT 7.0% is retained on the coarse-mesh sieve, and NMT 15.0% passes through the fine-mesh sieve designated on the label.
- **LOSS ON DRYING (731)**  
**Sample:** 10 g  
**Analysis:** Weigh the *Sample* in a tared weighing bottle, and dry at  $105^\circ$  for 2 h.  
**Acceptance criteria:** 11.0%–16.0%
- **HARDNESS**  
**Sample:** 200 g  
**Analysis:** Screen the *Sample* on a mechanical sieve shaker (see *Particle Size Distribution Estimation by Analytical Sieving (786)*) having a frequency of oscillation of  $285 \pm 3$  cycles/min, for 3 min, to remove granules coarser than 4-mesh and finer than 8-mesh. Weigh 50 g of the granules retained on the screen, and place them in a hardness pan of the following description: the hardness pan has a diameter of 200 mm and a concave brass bottom, and the bottom of the pan is 7.9 mm thick at the circumference and 3.2 mm thick at the center and has an inside spherical radius of curvature of 109 cm. Add 15 steel balls of 7.9-mm diameter, and shake on a mechanical sieve shaker for 30 min. Remove the steel balls, brush the contents of the hardness pan onto a sieve of the fine-mesh size designated on the label, shake for 3 min on the mechanical sieve shaker, and weigh.  
**Acceptance criteria:** The percentage of Barium Hydroxide Lime retained on the screen is NLT 75.0% and represents the hardness.
- **CARBON DIOXIDE ABSORBENCY**  
**Analysis:** Fill the lower transverse section of a U-shaped drying tube of about 15-mm internal diameter and 15-cm height with loosely packed glass wool. Place in one arm of the tube about 5 g of anhydrous calcium chloride, and weigh the tube and the contents. Into the other arm of the tube, place 9.5–10.5 g of Barium Hydroxide Lime, and again weigh. Insert stoppers in the open arms of the U-tube, and connect the side tube of the arm filled with Barium Hydroxide Lime to a calcium chloride drying tube, which in turn is connected to a suitable source of supply of carbon dioxide. Pass the carbon dioxide through the U-tube at a rate of 75 mL/min for 20 min, timed. Disconnect the U-tube, cool to room temperature, remove the stoppers, and weigh.  
**Acceptance criteria:** The increase in weight is NLT 19.0% of the weight of Barium Hydroxide Lime used for the test.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** If an indicator has been added, the name and color change of such indicator are stated on the container label. The container label indicates also the mesh size in terms of standard-mesh sieve sizes (see *Powder Fineness* <811>).

---

**Barium Sulfate**

---

BaSO<sub>4</sub> 233.39  
Sulfuric acid, barium salt (1:1);  
Barium sulfate (1:1) [7727-43-7].

**DEFINITION**

Barium Sulfate contains NLT 97.5% and NMT 100.5% of barium sulfate (BaSO<sub>4</sub>).

**IDENTIFICATION**

- **A. IDENTIFICATION TESTS—GENERAL, Sulfate** <191>  
**Sample solution:** Mix 0.5 g of Barium Sulfate with 2 g each of anhydrous sodium carbonate and anhydrous potassium carbonate, heat the mixture in a crucible until fusion is complete, treat the resulting fused mass with hot water, and filter.  
**Acceptance criteria:** The filtrate, acidified with hydrochloric acid, meets the requirements.
- **B. IDENTIFICATION TESTS—GENERAL, Barium** <191>  
**Sample solution:** Dissolve a portion of the well-washed residue from *Identification test A* in 6 N acetic acid.  
**Acceptance criteria:** The solution meets the requirements.

**ASSAY****• PROCEDURE**

**Sample:** 0.58–0.62 g, weighed in a tared platinum crucible

**Analysis:** Add 10 g of anhydrous sodium carbonate to the crucible, and mix by rotating the crucible. Fuse over a blast burner until a clear melt is obtained, and heat for an additional 30 min. Cool, place the crucible in a 400-mL beaker, add 250 mL of water, stir with a glass rod, and heat to dislodge the melt. Remove the crucible from the beaker, and wash with water, collecting the washings in the beaker. Rinse the inside of the crucible with 2 mL of 6 N acetic acid and then with water, again collecting the washings in the beaker, and continue heating and stirring until the melt is disintegrated. Cool the beaker in an ice bath until the precipitate settles, and decant the clear liquid through filter paper (Whatman No. 40, or equivalent), taking care to transfer as little precipitate as possible to the paper.

Wash twice by decantation as follows. Wash down the inside of the beaker with 10 mL of cold sodium carbonate solution (1 in 50), swirl the contents of the beaker, allow the precipitate to settle, and decant the supernatant through the same filter paper as before, transferring as little precipitate as possible to the paper. Place the beaker containing the bulk of the barium carbonate precipitate under the funnel, wash the filter paper with five 1-mL portions of 3 N hydrochloric acid, and wash the paper with water. [NOTE—The solution may be slightly hazy.]

Add 100 mL of water, 5.0 mL of hydrochloric acid, 10.0 mL of ammonium acetate solution (2 in 5), 25 mL of potassium dichromate solution (1 in 10), and 10.0 g of urea. Cover the beaker with a watch glass, and digest at 80°–85° for NLT 16 h. Filter while hot through a tared, fine-porosity, sintered-glass crucible, transferring all of the precipitate with the aid of a rubber-tipped stirring rod. Wash the precipitate with potassium dichromate solution (1 in 200), and finally with 20 mL

of water. Dry at 105° for 2 h, cool, and weigh. The weight of the barium chromate so obtained, multiplied by 0.9213, represents the weight of barium sulfate (BaSO<sub>4</sub>).

**Acceptance criteria:** 97.5%–100.5%

**IMPURITIES****• HEAVY METALS** <231>

**Sample solution:** Boil 4.0 g with a mixture of 2 mL of glacial acetic acid and 48 mL of water for 10 min. Dilute with water to 50 mL, filter, and use 25 mL of the filtrate.

**Acceptance criteria:** NMT 10 ppm

**• LIMIT OF SULFIDE**

**Sample solution:** Transfer 10 g to a 500-mL conical flask. Add 100 mL of 0.3 N hydrochloric acid.

**Control solution:** 100 mL of 0.3 N hydrochloric acid containing 5 µg of sulfide in a 500-mL conical flask

**Analysis:** Cover the mouth of both conical flasks with a circle of filter paper that has been moistened at the area over the mouth of the flask with 0.15 mL of lead acetate TS, the paper being held in place with a string tied around the neck of the flask. Boil each mixture gently for 10 min, taking care to avoid spattering the paper.

**Acceptance criteria:** NMT 0.5 µg/g; any darkening of the paper by the *Sample solution* is not greater than that produced by the similarly treated *Control solution*.

**• LIMIT OF ACID-SOLUBLE SUBSTANCES**

**Sample solution:** Cool the mixture obtained in the test for *Limit of Sulfide*, add water to restore approximately the original volume, and filter it through paper that previously has been washed with a mixture of 10 mL of 3 N hydrochloric acid and 90 mL of water, returning the first portions, if necessary, to obtain a clear filtrate.

**Analysis:** Evaporate 50 mL of the filtrate on a steam bath to dryness, and add 2 drops of hydrochloric acid and 10 mL of hot water. Filter again through acid-washed paper, prepared as directed above. Wash the filter with 10 mL of hot water, and evaporate the combined filtrate and washings in a tared dish on a steam bath to dryness. Dry the residue at 105° for 1 h.

**Acceptance criteria:** NMT 0.3%; the residue weighs NMT 15 mg.

**• LIMIT OF SOLUBLE BARIUM SALTS**

**Sample:** The residue obtained in the test for *Limit of Acid-Soluble Substances*

**Control:** 10 mL of water containing 0.5 mL of 2 N sulfuric acid and 50 µg of barium

**Analysis:** Treat the *Sample* with 10 mL of water, pass the solution through a filter previously washed with 100 mL of 0.3 N hydrochloric acid, and add 0.5 mL of 2 N sulfuric acid.

**Acceptance criteria:** NMT 0.001%; any turbidity formed in the *Sample* within 30 min is NMT that produced in the similarly treated *Control*.

**SPECIFIC TESTS**

- **PH** <791>: 3.5–10.0, in a 10% (w/w) aqueous suspension

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

---

**Barium Sulfate Paste**

---

**DEFINITION**

Barium Sulfate Paste is a semisolid formulation of finely divided particles of Barium Sulfate in a suitable base. It contains NLT 90.0% and NMT 110.0% of the labeled amount of barium sulfate (BaSO<sub>4</sub>). It may contain one or more

suitable colors, flavors, suspending or dispersing agents, and preservatives.

## IDENTIFICATION

### • A. IDENTIFICATION TESTS—GENERAL, Sulfate <191>

**Sample:** Ignite a quantity of Paste equivalent to 0.5 g of barium sulfate to constant weight.

**Analysis:** Mix 0.5 g of the ignited *Sample* with 2 g each of anhydrous sodium carbonate and anhydrous potassium carbonate, heat the mixture in a crucible until fusion is complete, treat the resulting fused mass with hot water, and filter. Proceed as directed in the chapter.

**Acceptance criteria:** The filtrate, acidified with hydrochloric acid, meets the requirements.

### • B. IDENTIFICATION TESTS—GENERAL, Barium <191>

**Sample solution:** Dissolve a portion of the well-washed residue from *Identification test A* in 6 N acetic acid.

**Acceptance criteria:** The solution meets the requirements.

## ASSAY

### • PROCEDURE

**Sample:** Barium Sulfate Paste, equivalent to 0.60 g of barium sulfate, weighed in a tared platinum crucible

**Analysis:** Ignite the *Sample* over a low flame until any organic matter is thoroughly carbonized. Cool, cautiously add 0.5 mL of nitric acid and 0.5 mL of sulfuric acid, and continue the ignition over a low flame until the residue becomes gray in color, then ignite over the full heat of a blast burner. Allow the contents of the crucible to cool to room temperature.

[NOTE—If the specimen contains a silicate, such as bentonite, proceed as follows. Add 10 mL of water and 1 mL of sulfuric acid to the residue in the crucible, mix, and add 10 mL of hydrofluoric acid. Heat gently over a low flame until fumes of sulfur trioxide appear. Add 5 mL more of hydrofluoric acid, heat again over a low flame to the appearance of dense fumes, and continue heating until the sulfuric acid has been completely volatilized. Allow the contents of the crucible to cool.]

[NOTE—If the specimen does not contain a silicate, omit the treatment of the specimen with hydrofluoric and sulfuric acids.]

Add to the treated or untreated specimen in the platinum crucible 10 g of anhydrous sodium carbonate, fuse over a blast burner until a clear melt is obtained, and heat for an additional 30 min. Cool, place the crucible in a 400-mL beaker, add 250 mL of water, stir with a glass rod, and heat to dislodge the melt. Remove the crucible from the beaker, and wash with water, collecting the washings in the beaker. Rinse the inside of the crucible with 2 mL of 6 N acetic acid and then with water, again collecting the washings in the beaker, and continue heating and stirring until the melt is disintegrated. Cool the beaker in an ice bath until the precipitate settles, and decant the clear liquid through filter paper (Whatman No. 40, or equivalent), taking care to transfer as little precipitate as possible to the paper.

Wash twice by decantation as follows. Wash down the inside of the beaker with 10 mL of cold sodium carbonate solution (1 in 50), swirl the contents of the beaker, allow the precipitate to settle, and decant the supernatant through the same filter paper as before, transferring as little precipitate as possible to the paper. Place the beaker containing the bulk of the barium carbonate precipitate under the funnel, wash the filter paper with five 1-mL portions of 3 N hydrochloric acid, and wash the paper with water. [NOTE—The solution may be slightly hazy.]

Add 100 mL of water, 5.0 mL of hydrochloric acid, 10.0 mL of ammonium acetate solution (2 in 5), 25 mL of potassium dichromate solution (1 in 10), and 10.0 g of urea. Cover the beaker with a watch glass, and di-

gest at 80°–85° for NLT 16 h. Filter while hot through a tared, fine-porosity, sintered-glass crucible, transferring all of the precipitate with the aid of a rubber-tipped stirring rod. Wash the precipitate with potassium dichromate solution (1 in 200), and finally with 20 mL of water. Dry at 105° for 2 h, cool, and weigh. The weight of the barium chromate so obtained, multiplied by 0.9213, represents the weight of barium sulfate ( $\text{BaSO}_4$ ).

**Acceptance criteria:** 90.0%–110.0%

## SPECIFIC TESTS

### • MICROBIAL ENUMERATION TESTS <61> and TESTS FOR SPECIFIED MICROORGANISMS <62>

**For products labeled for oral administration only:**

The total aerobic microbial count does not exceed  $10^2$  cfu/g. The total combined molds and yeasts count does not exceed  $10^1$  cfu/g. It meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*. The total enterobacterial count does not exceed  $10^1$  cfu/g.

**For products labeled for oral administration and rectal administration:**

The total aerobic microbial count does not exceed  $10^2$  cfu/g. The total combined molds and yeasts count does not exceed  $10^1$  cfu/g. It meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*. The total enterobacterial count does not exceed  $10^1$  cfu/g.

**For products labeled for rectal administration only:**

The total aerobic microbial count does not exceed  $10^3$  cfu/g. The total combined molds and yeasts count does not exceed  $10^2$  cfu/g. It meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*. The total enterobacterial count does not exceed  $10^1$  cfu/g.

### • pH <791>: 3.0–10.0

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from freezing and from excessive heat.

## Barium Sulfate Suspension

### DEFINITION

Barium Sulfate Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of barium sulfate ( $\text{BaSO}_4$ ). It contains suitable dispersing and/or suspending agents so that when mixed as directed in the labeling, it yields a uniformly dispersed suspension. It may contain one or more suitable colors, flavors, fluidizing agents, and preservatives.

### IDENTIFICATION

#### • A. IDENTIFICATION TESTS—GENERAL, Sulfate <191>

**Sample:** Shake the Suspension, and transfer a volume equivalent to 0.5 g of barium sulfate to a suitable container. Ignite to constant weight.

**Analysis:** Mix 0.5 g of the ignited *Sample* with 2 g each of anhydrous sodium carbonate and anhydrous potassium carbonate, heat the mixture in a crucible until fusion is complete, treat the resulting fused mass with hot water, and filter. Proceed as directed in the chapter.

**Acceptance criteria:** The filtrate, acidified with hydrochloric acid, meets the requirements.

#### • B. IDENTIFICATION TESTS—GENERAL, Barium <191>

**Sample solution:** Dissolve a portion of the well-washed residue from *Identification test A* in 6 N acetic acid.

**Acceptance criteria:** The solution meets the requirements.

**ASSAY****• PROCEDURE**

**Sample:** A volume of Suspension, previously well shaken in its original container, equivalent to 0.60 g of barium sulfate, in a tared platinum crucible

**Analysis:** Ignite over a low flame until any organic matter is thoroughly carbonized. Cool, cautiously add 0.5 mL of nitric acid and 0.5 mL of sulfuric acid, and continue the ignition over a low flame until the residue becomes gray in color, then ignite over the full heat of a blast burner. Allow the contents of the crucible to cool to room temperature.

[NOTE—If the specimen contains a silicate, such as bentonite, proceed as follows. Add 10 mL of water and 1 mL of sulfuric acid to the residue in the crucible, mix, and add 10 mL of hydrofluoric acid. Heat gently over a low flame until fumes of sulfur trioxide appear. Add 5 mL more of hydrofluoric acid, heat again over a low flame to the appearance of dense fumes, and continue heating until the sulfuric acid has been completely volatilized. Allow the contents of the crucible to cool.]

[NOTE—If the specimen does not contain a silicate, omit the treatment of the specimen with hydrofluoric and sulfuric acids.]

Add to the treated or untreated specimen in the platinum crucible 10 g of anhydrous sodium carbonate, fuse over a blast burner until a clear melt is obtained, and heat for an additional 30 min. Cool, place the crucible in a 400-mL beaker, add 250 mL of water, stir with a glass rod, and heat to dislodge the melt. Remove the crucible from the beaker, and wash with water, collecting the washings in the beaker. Rinse the inside of the crucible with 2 mL of 6 N acetic acid and then with water, again collecting the washings in the beaker, and continue heating and stirring until the melt is disintegrated. Cool the beaker in an ice bath until the precipitate settles, and decant the clear liquid through filter paper (Whatman No. 40, or equivalent), taking care to transfer as little precipitate as possible to the paper.

Wash twice by decantation as follows. Wash down the inside of the beaker with 10 mL of cold sodium carbonate solution (1 in 50), swirl the contents of the beaker, allow the precipitate to settle, and decant the supernatant through the same filter paper as before, transferring as little precipitate as possible to the paper. Place the beaker containing the bulk of the barium carbonate precipitate under the funnel, wash the filter paper with five 1-mL portions of 3 N hydrochloric acid, and wash the paper with water. [NOTE—The solution may be slightly hazy.]

Add 100 mL of water, 5.0 mL of hydrochloric acid, 10.0 mL of ammonium acetate solution (2 in 5), 25 mL of potassium dichromate solution (1 in 10), and 10.0 g of urea. Cover the beaker with a watch glass, and digest at 80°–85° for NLT 16 h. Filter while hot through a tared, fine-porosity, sintered-glass crucible, transferring all of the precipitate with the aid of a rubber-tipped stirring rod. Wash the precipitate with potassium dichromate solution (1 in 200), and finally with 20 mL of water. Dry at 105° for 2 h, cool, and weigh. The weight of the barium chromate so obtained, multiplied by 0.9213, represents the weight of barium sulfate ( $\text{BaSO}_4$ ).

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

- MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total bacterial count does not exceed  $10^2$  cfu/mL, the total combined molds and yeasts count does not exceed  $10^1$  cfu/mL, and it meets the requirements of the tests for absence of *Salmonella* species, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*.

- pH (791):** 3.5–10.0

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight containers, and avoid freezing.

---

**Barium Sulfate for Suspension**

---

**DEFINITION**

Barium Sulfate for Suspension is a dry mixture of Barium Sulfate and one or more suitable dispersing and/or suspending agents. It contains NLT 90.0% and NMT 110.0% of the labeled amount of barium sulfate ( $\text{BaSO}_4$ ). It may contain one or more suitable colors, flavors, fluidizing agents, and preservatives.

**IDENTIFICATION**

- A. IDENTIFICATION TESTS—GENERAL, Sulfate (191)**

Allow the contents of the crucible to cool.]

[NOTE—If the specimen does not contain a silicate, omit the treatment of the specimen with hydrofluoric and sulfuric acids.]

Add to the treated or untreated specimen in the platinum crucible 10 g of anhydrous sodium carbonate, fuse over a blast burner until a clear melt is obtained, and heat for an additional 30 min. Cool, place the crucible in a 400-mL beaker, add 250 mL of water, stir with a glass rod, and heat to dislodge the melt. Remove the crucible from the beaker, and wash with water, collecting the washings in the beaker. Rinse the inside of the crucible with 2 mL of 6 N acetic acid and then with water, again collecting the washings in the beaker, and continue heating and stirring until the melt is disintegrated. Cool the beaker in an ice bath until the precipitate settles, and decant the clear liquid through filter paper (Whatman No. 40, or equivalent), taking care to transfer as little precipitate as possible to the paper.

Wash twice by decantation as follows. Wash down the inside of the beaker with 10 mL of cold sodium carbonate solution (1 in 50), swirl the contents of the beaker, allow the precipitate to settle, and decant the supernatant through the same filter paper as before, transferring as little precipitate as possible to the paper. Place the beaker containing the bulk of the barium carbonate precipitate under the funnel, wash the filter paper with five 1-mL portions of 3 N hydrochloric acid, and wash the paper with water. [NOTE—The solution may be slightly hazy.]

Add 100 mL of water, 5.0 mL of hydrochloric acid, 10.0 mL of ammonium acetate solution (2 in 5), 25 mL of potassium dichromate solution (1 in 10), and 10.0 g of urea. Cover the beaker with a watch glass, and digest at 80°–85° for NLT 16 h. Filter while hot through a tared, fine-porosity, sintered-glass crucible, transferring all of the precipitate with the aid of a rubber-tipped stirring rod. Wash the precipitate with potassium dichromate solution (1 in 200), and finally with 20 mL of water. Dry at 105° for 2 h, cool, and weigh. The weight of the barium chromate so obtained, multiplied by 0.9213, represents the weight of barium sulfate ( $\text{BaSO}_4$ ).

**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

- **LOSS ON DRYING** (731)  
Analysis: Dry at 105° for 4 h.  
Acceptance criteria: NMT 1.0%
- **pH** (791): 3.5–10.0, in a 60% (w/w) aqueous suspension, or constituted for its intended use as directed in the labeling

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

---

### Barium Sulfate Tablets

---

#### DEFINITION

Barium Sulfate Tablets are flat-sided disks between 11.5 mm and 13.5 mm in diameter and contain NLT 90.0% and NMT 110.0% of the labeled amount of barium sulfate ( $\text{BaSO}_4$ ).

#### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Sulfate** (191)  
Sample: A portion of powdered Tablets equivalent to 0.6 g of barium sulfate  
Analysis: Mix the Sample with 2 g each of anhydrous sodium carbonate and anhydrous potassium carbonate, heat the mixture in a crucible until fusion is complete, treat the resulting fused mass with hot water, and filter. Proceed as directed in the chapter.  
Acceptance criteria: The filtrate, acidified with hydrochloric acid, meets the requirements.
- **B. IDENTIFICATION TESTS—GENERAL, Barium** (191)  
Sample solution: Dissolve a portion of the well-washed residue from Identification test A in 6 N acetic acid.  
Acceptance criteria: The solution meets the requirements.

#### ASSAY

- **PROCEDURE**  
Sample: A portion of powdered Tablets, equivalent to 0.6 g of barium sulfate, weighed in a tared platinum crucible  
Analysis: Add 10 g of anhydrous sodium carbonate to the crucible, and mix by rotating the crucible. Fuse over a blast burner until a clear melt is obtained, and heat for an additional 30 min. Cool, place the crucible in a

400-mL beaker, add 250 mL of water, stir with a glass rod, and heat to dislodge the melt. Remove the crucible from the beaker, and wash with water, collecting the washings in the beaker. Rinse the inside of the crucible with 2 mL of 6 N acetic acid and then with water, again collecting the washings in the beaker, and continue heating and stirring until the melt is disintegrated. Cool the beaker in an ice bath until the precipitate settles, and decant the clear liquid through filter paper (Whatman No. 40, or equivalent), taking care to transfer as little precipitate as possible to the paper.

Wash twice by decantation as follows. Wash down the inside of the beaker with 10 mL of cold sodium carbonate solution (1 in 50), swirl the contents of the beaker, allow the precipitate to settle, and decant the supernatant through the same filter paper as before, transferring as little precipitate as possible to the paper. Place the beaker containing the bulk of the barium carbonate precipitate under the funnel, wash the filter paper with five 1-mL portions of 3 N hydrochloric acid, and wash the paper with water. [NOTE—The solution may be slightly hazy.]

Add 100 mL of water, 5.0 mL of hydrochloric acid, 10.0 mL of ammonium acetate solution (2 in 5), 25 mL of potassium dichromate solution (1 in 10), and 10.0 g of urea. Cover the beaker with a watch glass, and digest at 80°–85° for NLT 16 h. Filter while hot through a tared, fine-porosity, sintered-glass crucible, transferring all of the precipitate with the aid of a rubber-tipped stirring rod. Wash the precipitate with potassium dichromate solution (1 in 200), and finally with 20 mL of water. Dry at 105° for 2 h, cool, and weigh. The weight of the barium chromate so obtained, multiplied by 0.9213, represents the weight of barium sulfate ( $\text{BaSO}_4$ ).

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

- **DISINTEGRATION** (701): NLT 10 min and NMT 30 min
- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

---

### BCG Live

---

» BCG Live (intravesical) for immunotherapy is a freeze-dried preparation of attenuated live bacteria derived from a culture of *Bacillus Calmette-Guérin* (*Mycobacterium bovis*, var. BCG) and used intravesically in the treatment of carcinoma *in situ* and papilloma tumors of the urinary bladder. The bacteria are grown in a medium that does not contain substances known to cause toxic or allergic reactions in human beings or to cause the bacteria to become virulent for guinea pigs. The culture is harvested and formulated to contain one or more excipients. The freeze-dried preparation is reconstituted and further diluted aseptically with a sterile diluent for use. A reconstituted dose contains  $1.0\text{--}19.2 \times 10^8$  colony-forming units (cfu). BCG Live does not contain a preservative.

**Packaging and storage**—BCG Live is sensitive to light and therefore must be preserved and stored in a glass con-

tainer where it is protected from direct light at a temperature between 2° and 8°.

**Expiration date**—The product is stable for 3 years when stored between 2° and 8°.

**Labeling**—Label it to indicate the dry weight of bacteria in a vial, cfu per dose, the storage conditions, the expiration date, and that it is not to be used after the expiration date given on the package. Label it to state that it should be protected from light and that it should be used immediately after reconstitution/dilution. Label it to indicate that it is “for intravesical use”.

**Identification**—BCG Live is identified by microscopic examination of the bacilli in stained smears demonstrating their acid-fast property. Alternatively, validated molecular biology techniques may be used.

**General safety**—It meets the requirements as set forth for *Safety Tests—Biologicals* under *Biological Reactivity Tests, In Vivo* (88), modified as follows. Guinea pigs are injected intraperitoneally with 3.0 mL of the reconstituted product.

**Sterility** (71)—It meets the requirements when tested as directed for *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined*.

#### **Virulent mycobacteria—**

**Test suspension**—Reconstitute the freeze-dried BCG Live as per the manufacturer's instructions for human use with the diluent recommended by the manufacturer, and dilute aseptically to about 2 mg per mL with sterile BCG diluent.

**Procedure**—Randomly select not fewer than six guinea pigs of the same sex, each weighing 250 to 300 g. Inject each animal with a total of at least 4 mg of the *Test suspension* intramuscularly or subcutaneously in the rear left internal thigh, and observe them for a period of 6 weeks. Note the number of animals that survive at the end of the observation period, and then sacrifice them. Perform autopsies of all animals postmortem to examine them for evidence of tuberculous infections, particularly at the popliteal and inguinal lymph nodes, liver, spleen, pancreas, and lungs, as well as at the injection site. If any abnormalities are found, perform a histological examination using standard and Acid-Fast staining techniques to detect Acid-Fast organisms. The product complies with the test if none of the animals show signs of tuberculosis and not more than one-third of the animals die during the observation period.

#### **Skin reactivity—**

**Test suspensions**—Using the same diluent and the *Test suspension* prepared as directed in the test for *Virulent mycobacteria*, further dilute aseptically by making three serial tenfold dilutions.

**Procedure**—Randomly select two guinea pigs (male or female), each weighing 250 to 300 g. Inject 0.1 mL of each of the four suspensions intradermally at different sites on the back of each animal. After 4 weeks, the animals are shaved so that the injection sites and any reactions are made clearly visible. The diameters of the reactions are measured, and the presence of necrosis or nodules are noted. The reaction for the largest dose is between 4 and 10 mm and the smallest dose induces a nodule less than or equal to 4 mm. Each animal gains weight during the observation period.

#### **Tuberculin sensitivity—**

**Tuberculin solution**—Use tuberculin, purified protein derivative, to prepare a solution containing 25 U.S. Tuberculin Units per 0.1 mL. Dilute aseptically, if necessary, with sterile 0.9% sodium chloride solution.

**Procedure**—Use the same animals on which the *Skin reactivity* test is performed. After the *Skin reactivity* test is completed, inject each animal intradermally on the back with 0.1 mL of the *Tuberculin solution*, and observe after 18 to 24 hours. An erythematous reaction of not less than 10 mm in diameter is measured on each animal.

**Residual moisture**: Not greater than the limit approved for the particular product, determined by a suitable validated method. Limits vary in accordance with the method.

**Viability**—Determine the potencies of BCG Live using not less than 5 containers before freeze-drying and an equal number of containers after freeze-drying, following the procedure described under *Potency*, except use the suspension before freeze-drying as is. The loss in viability due to freeze-drying is not more than 90%.

**Potency**—Determine the number of viable units per mL by viable count on solid medium using a method suitable for the product to be examined. Alternatively, a validated biochemical method may be used.

---

## **BCG Vaccine**

---

» BCG Vaccine conforms to the regulations of the FDA concerning biologics (see *Biologics* (1041)). It is a dried, living culture of the bacillus Calmette-Guérin strain of *Mycobacterium tuberculosis* var. *bovis*, grown in a suitable medium from a seed strain of known history that has been maintained to preserve its capacity for conferring immunity. It contains an amount of viable bacteria such that inoculation, in the recommended dose, of tuberculin-negative persons results in an acceptable tuberculin conversion rate. It is free from other organisms, and contains a suitable stabilizer. It contains no antimicrobial agent.

**NOTE**—Use the Vaccine immediately after its constitution, and discard any unused portion after 2 hours.

**Packaging and storage**—Preserve in hermetic containers, preferably of Type I glass, at a temperature between 2° and 8°.

**Expiration date**—The expiration date is not later than 6 months after date of issue, or not later than 1 year after date of issue if stored at a temperature below 5°.

---

## **Beclomethasone Dipropionate**

---

$C_{28}H_{37}ClO_7$  521.04

Pregna-1,4-diene-3,20-dione, 9-chloro-11-hydroxy-16-methyl-17,21-bis(1-oxopropoxy)-, (11 $\beta$ ,16 $\beta$ )-, 9-Chloro-11 $\beta$ ,17,21-trihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione 17,21-dipropionate [5534-09-8].  
Monohydrate 539.07.

» Beclomethasone Dipropionate is anhydrous or contains one molecule of water of hydration. It contains not less than 97.0 percent and not more than 103.0 percent of  $C_{28}H_{37}ClO_7$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Beclomethasone Dipropionate RS  
USP Testosterone Propionate RS

**Identification**, *Infrared Absorption* (197M).

**Specific rotation** (781S): between +88° and +94°.

*Test solution*: 10 mg per mL, in dioxane.

**Loss on drying** (731)—Dry it at 105° for 3 hours: the anhydrous form loses not more than 0.5% of its weight; the monohydrate form loses between 2.8% and 3.8% of its weight.

**Residue on ignition** (281): not more than 0.1%.

#### Assay—

*Mobile phase*—Prepare a suitable degassed solution of 3 volumes of acetonitrile in 2 volumes of water, such that the retention time of beclomethasone dipropionate is approximately 6 minutes and that of testosterone propionate is approximately 10 minutes.

*Internal standard solution*—Dissolve a suitable quantity of USP Testosterone Propionate RS, accurately weighed, in methanol to obtain a solution having a concentration of about 1.2 mg per mL.

*Standard preparation*—Dissolve a suitable quantity of USP Beclomethasone Dipropionate RS, accurately weighed, in methanol to obtain a solution having a concentration of about 1.4 mg per mL. Transfer 4.0 mL of this solution to a suitable vial, and add 4.0 mL of *Internal standard solution* to obtain a solution having a known concentration of about 0.7 mg per mL with respect to the Reference Standard and 0.6 mg per mL with respect to the internal standard.

*Assay preparation*—Weigh accurately about 70 mg of Beclomethasone Dipropionate, transfer to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 4.0 mL of this solution to a suitable vial, and add 4.0 mL of *Internal standard solution*.

*Procedure*—Separately inject equal volumes (between 5  $\mu$ L and 25  $\mu$ L) of the *Assay preparation* and the *Standard preparation* into a high-performance liquid chromatograph (see *Chromatography* (621)) operated at room temperature, adjusting the specimen size and other operating parameters such that the peak obtained with the internal standard in the *Standard preparation* is about 0.6 to 0.9 full-scale. Typically, the apparatus is fitted with a 4-mm  $\times$  30-cm column that contains packing L1 and is equipped with an UV detector capable of monitoring absorption at 254 nm, a suitable recorder, and a pump capable of operating at a column pressure of up to 3500 psi. In a suitable chromatogram, the coefficient of variation for five replicate injections of the *Standard preparation* is not more than 3.0%. Calculate the quantity, in mg, of  $C_{28}H_{37}ClO_7$  in the portion of Beclomethasone Dipropionate taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Beclomethasone Dipropionate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak height ratios of beclomethasone dipropionate to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Belladonna Leaf

» Belladonna Leaf consists of the dried leaf and flowering or fruiting top of *Atropa belladonna* Linné or of its variety *acuminata* Royle ex Lindley (Fam. Solanaceae). Belladonna Leaf yields not less

than 0.35 percent of the alkaloids of belladonna leaf.

**Packaging and storage**—Preserve in well-closed containers and avoid long exposure to direct sunlight. Preserve powdered Belladonna Leaf in light-resistant containers.

**USP Reference standards** (11)—  
USP Atropine Sulfate RS  
USP Homatropine Hydrobromide RS  
USP Scopolamine Hydrobromide RS

#### Botanic characteristics—

*Belladonna Leaf*—Usually partly matted together, crumpled or broken leaves, together with some smaller stems and a number of flowers and fruits. The leaves are thin and brittle, mostly light green to moderate olive-green. The lamina is mostly from 5 to 25 cm in length and from 4 to 12 cm in width and possesses an ovate-lanceolate to broadly ovate outline, an acute to acuminate apex, an entire margin, an acute to somewhat decurrent base and slightly hairy surface, the hairs being more abundant along the veins; when broken transversely, it shows numerous light-colored dots (crystal cells) visible with a lens. The petiole is slender and usually up to 4 cm in length. The flowers possess a campanulate corolla with 5 small, reflexed lobes, purplish to yellowish purple, becoming faded to brown or dusky yellow or yellow, a green, 5-lobed calyx, 5 epipetalous stamens, and a superior, bilocular ovary with numerous ovules. The fruit is subglobular, dark yellow to yellowish brown to dusky red or black, up to about 12 mm in width and sometimes subtended by the persistent calyx and containing numerous flattened, somewhat reniform seeds, the latter up to about 2 mm in width. The stems are more or less flattened and hollow and finely hairy when young.

*Histology*—*Leaf*: The epidermis of the lamina possesses wavy anticlinal walls and a distinctly striated cuticle. Stomata are more numerous in the lower epidermis and are surrounded by 3 or 4 neighboring cells, one of which is smaller than the others. The nonglandular hairs are uniseriate and up to 6-celled. Short club-shaped glandular hairs with a 1-celled stalk and multicellular head and long glandular hairs with a uniseriate stalk and unicellular head occur on both epidermises. The mesophyll consists of a single layer of palisade parenchyma beneath which occurs spongy parenchyma, the latter with scattered cells filled with microcrystals. The midrib contains an arc of bicollateral bundles, collenchyma beneath upper epidermis, and scattered parenchyma cells with microcrystals. *Stem*: The stem shows an epidermis with striated cuticle and few hairs, a distinct endodermis, small strands of long, thin-walled, slightly lignified pericyclic fibers, and a circle of bicollateral bundles. The parenchyma of the cortex and pith is interspersed with crystal cells. *Flower*: The calyx possesses numerous glandular hairs with uniseriate stalks and 1- to 3-celled glandular heads. The corolla shows a papillose inner epidermis and an outer epidermis with glandular hairs similar to those of the calyx. The pollen grains, when mounted in chloral hydrate solution, are subspherical, about 40  $\mu$ m in diameter, tricolpate, having 3 germinal furrows and rows of pits between the ridges on the exine. *Fruit*: The epicarp exhibits polygonal epidermal cells with a striated cuticle and stomata. The mesocarp consists of large pulp cells some of which contain rosette aggregate crystals of calcium oxalate. *Seed*: The seed is characterized by an epidermis of large, wavy-walled cells with prominent ridges over the anticlinal walls.

*Powdered Belladonna Leaf*—Light olive-brown to moderate olive-green in color. The following are among the elements of identification: the separate microcrystals, the dark gray crystal cells, the cuticular striping of the epidermal cells, the vessels with ellipsoidal bordered pits, the fibers of the stem, and occasional hairs and pollen grains. Rosette aggregates of calcium oxalate and fragments of the seed occur when the drug contains belladonna fruits. Examine Belladonna

Leaf for hairs having a papillose cuticle and for raphides of calcium oxalate: their presence indicates adulteration.

**Acid-insoluble ash** (561): not more than 3.0%.

**Belladonna stems**—The proportion of belladonna stems over 10 mm in diameter does not exceed 3.0%.

**Assay—**

*pH 9.5 Phosphate buffer, Internal standard solution, Standard preparation, Extraction blank, Standard curve, Chromatographic system, and System suitability*—Proceed as directed in the Assay under *Belladonna Extract*.

*Assay preparation*—Moisten 10 g, previously reduced to a moderately coarse powder and accurately weighed, with a mixture of 8 mL of ammonium hydroxide, 10 mL of alcohol, and 20 mL of ether, and extract the alkaloids by either of the methods given in the following two paragraphs. If necessary, reduce the volume of the extract to 100 mL by evaporation on a steam bath.

*I*—Place the moistened drug in a continuous-extraction thimble, and allow maceration to proceed overnight, then extract with ether for 3 hours, or longer if necessary to effect complete extraction.

*II*—Place the moistened drug in a small percolator, and allow maceration to proceed overnight. Percolate slowly with a mixture of 3 volumes of ether and 1 volume of chloroform. Continue the percolation until the residue from 3 to 4 mL of percolate last passed, when dissolved in dilute sulfuric acid (1 in 70) and treated with mercuric iodide TS, shows not more than a faint turbidity.

Transfer the extract to a separator with the aid of ether. Extract with five 15-mL portions of dilute sulfuric acid (1 in 70), filtering each portion drawn off into a 100-mL volumetric flask. Wash the filter with dilute sulfuric acid (1 in 70), and collect the washings in the flask. Add dilute sulfuric acid (1 in 70) to volume, and mix. Dilute 20.0 mL of the resulting solution with the same dilute acid to 100.0 mL.

Pipet 10 mL of this solution into a 60-mL separator. To the separator add 1.0 mL of *Internal standard solution*, then add 15 mL of chloroform, shake vigorously, allow the layers to separate, and discard the chloroform layer. (If emulsions are formed, a *mixed solvent* consisting of chloroform-isopropyl alcohol (10:3) may be substituted for chloroform throughout the extraction procedure.) Add another 15 mL of chloroform, and extract again, discarding the chloroform phase. Add 15 mL of *pH 9.5 Phosphate buffer* and sufficient 1 N sodium hydroxide to yield a final pH between 9.0 and 9.5. Add 15 mL of chloroform, shake vigorously, and allow the layers to separate. Filter the organic phase through 10 g of anhydrous sodium sulfate (see *Sodium Sulfate, Anhydrous*, in the section *Reagent Specifications*), previously washed with chloroform and supported in a funnel with a small pledget of glass wool, into a suitable container. Extract again with two 15-mL portions of chloroform, again collecting the clarified organic phase. Wash the sodium sulfate and the tip of the funnel with 5 mL of chloroform. Evaporate the combined organic phases under reduced pressure, at a temperature below 45°, add 1 mL of chloroform, and mix to dissolve the alkaloids, taking care to wet the sides of the container.

*Procedure*—Record from the *Standard curves* the quantities, in mg, of atropine and scopolamine in the weight of the specimen taken. Proceed as directed for *Procedure* in the Assay under *Belladonna Extract*, through the next-to-the-last sentence. Add the quantity, in mg, of atropine and scopolamine, and multiply by 50 to obtain the weight, in mg, of alkaloids in the portion of Belladonna Leaf taken.

## Belladonna Extract

» Belladonna Extract contains, in each 100 g, not less than 1.15 g and not more than 1.35 g of the alkaloids of belladonna leaf.

**PILULAR BELLADONNA EXTRACT**

Prepare the extract by percolating 1000 g of Belladonna Leaf, using a mixture of 3 volumes of alcohol and 1 volume of water as the menstruum. Macerate the drug for 16 hours, and then percolate it at a moderate rate. Evaporate the percolate under reduced pressure and at a temperature not exceeding 60° to a pilular consistency, and adjust the remaining extract, after assaying, by dilution with liquid glucose so that the finished Extract will contain, in each 100 g, 1.25 g of the alkaloids of belladonna leaf.

**POWDERED BELLADONNA EXTRACT**

Prepare the extract by percolating 1000 g of Belladonna Leaf, using alcohol as the menstruum. Macerate the drug for 16 hours, and then percolate it slowly. Evaporate the percolate under reduced pressure and at a temperature not exceeding 60° to a soft extract, add 50 g of dry starch, and continue the evaporation, at the same temperature, until the product is dry. Powder the residue. The extract may be deprived of its fat by treating either the soft extract first obtained, or the dry and powdered extract, as directed under *Extracts* (see *Pharmaceutical Dosage Forms* <1151>). Assay the powdered residue, and add sufficient starch, previously dried at 100°, to obtain a finished Extract containing 1.25 g of the alkaloids of belladonna leaf in each 100 g. Mix the powders, and pass the Extract through a fine sieve.

**Packaging and storage**—Preserve in tight containers, at a temperature not exceeding 30°.

**USP Reference standards** <11>—

USP Atropine Sulfate RS

USP Homatropine Hydrobromide RS

USP Scopolamine Hydrobromide RS

**Assay—**

*pH 9.5 Phosphate buffer*—Dissolve 34.8 g of dibasic potassium phosphate in 900 mL of water, and adjust to a pH of 9.5, determined electrometrically, by the addition of 3 N hydrochloric acid or sodium hydroxide, with mixing.

*Internal standard solution*—Dissolve about 40 mg of USP Homatropine Hydrobromide RS, accurately weighed, in about 25 mL of dilute sulfuric acid (1 in 350) in a 50-mL volumetric flask, add the same dilute acid to volume, and mix. Prepare fresh on the day of use.

*Standard preparation*—Dissolve about 10 mg of USP Scopolamine Hydrobromide RS, accurately weighed, in about 5 mL of dilute sulfuric acid (1 in 350) in a 10-mL volumetric flask, add the same dilute acid to volume, and mix (*Solution A*). Dissolve about 20 mg of USP Atropine Sulfate RS, accurately weighed, in about 25 mL of dilute sulfuric acid (1 in 350) in a 50-mL volumetric flask, add 2.0 mL of *Solution A*, and mix. Add dilute sulfuric acid (1 in 350) to volume, and mix. Prepare fresh on the day of use.

*Extraction blank*—Place about 10 mL of dilute sulfuric acid (1 in 350) in a 60-mL separator. Proceed as directed under

*Assay preparation*, beginning with "then add 15 mL of chloroform." The blank chromatogram contains no significant interferences at the locus of atropine, scopolamine, or homatropine.

*Assay preparation*—Weigh accurately about 0.5 g of Extract, transfer to a 125-mL conical flask, and add 40 mL of dilute sulfuric acid (1 in 350). Heat to a temperature not above 45°, and stir to hasten solution. Filter the solution through filter paper into a 100-mL volumetric flask. Wash the flask and the filter with two 20-mL portions of warmed dilute sulfuric acid (1 in 350), and collect the washings in the 100-mL volumetric flask. Add dilute sulfuric acid (1 in 350) to volume, and mix.

Pipet 10 mL of this solution into a 60-mL separator. To the separator add 1.0 mL of *Internal standard solution*, then add 15 mL of chloroform, shake vigorously, allow the layers to separate, and discard the chloroform layer. (If emulsions are formed, a *mixed solvent* consisting of chloroform and isopropyl alcohol (10:3) may be substituted for chloroform throughout the extraction procedure.) Add another 15 mL of chloroform, and extract again, discarding the chloroform phase. Add 15 mL of pH 9.5 Phosphate buffer and sufficient 1 N sodium hydroxide to yield a final pH between 9.0 and 9.5. Add 15 mL of chloroform, shake vigorously, and allow the layers to separate. Filter the organic phase through 10 g of anhydrous sodium sulfate (see *Suitability for alkaloid assays* under *Sodium Sulfate, Anhydrous*, in the section *Reagents, Indicators, and Solutions*), previously washed with chloroform and supported in a funnel with a small pledget of glass wool, into a suitable container. Extract again with two 15-mL portions of chloroform, again collecting the clarified organic phase. Wash the sodium sulfate and the tip of the funnel with 5 mL of chloroform. Evaporate the combined organic phases under reduced pressure, at a temperature below 45°, add 1 mL of chloroform, and mix to dissolve the alkaloids, taking care to wet the sides of the container.

*Standard curve*—Prepare three *Standard solutions* as follows. Pipet into three separate 60-mL separators 1.0-, 2.0-, and 3.0-mL portions, respectively, of *Standard preparation*, and add 9.0, 8.0, and 7.0 mL, respectively, of dilute sulfuric acid (1 in 350). Proceed as directed under *Assay preparation*, beginning with "add 1.0 mL of *Internal standard solution*."

*Chromatographic system*—Under typical condition, the instrument contains a 1.2-m × 4-mm glass column packed with 3% G3 on S1AB. The column may be cured and conditioned as specified under *Gas Chromatography* (see *Chromatography* <621>). The column is maintained at a temperature of about 215°, and the injection port and detector block at about 240°, and dry helium is used as a carrier gas at a flow rate of about 65 mL per minute.

*System suitability*—Chromatograph six to ten injections of the *Assay preparation*, and record peak areas as directed for *Procedure*. The analytical system is suitable for conducting this assay if the relative standard deviation for the ratio,  $R_A$ , calculated by the formula:

$$100 \times (\text{standard deviation} / \text{mean ratio})$$

does not exceed 2.0%; the resolution,  $R$ , between  $a_H$  and  $a_A$  is not less than 3; and the tailing factor (the sum of the distances from peak center to the leading edge and to the trailing edge divided by twice the distance from peak center to the leading edge), measured at 5% of the peak height of  $a_A$ , does not exceed 2.0.

*Procedure*—Inject a portion (about 5  $\mu$ L) of each *Standard solution* into a suitable gas chromatograph equipped with a flame-ionization detector. Measure the areas,  $a_A$ ,  $a_H$ , and  $a_S$ , of the atropine, homatropine, and scopolamine peaks, re-

spectively, in each chromatogram, and calculate the ratios  $A_A$  and  $A_S$  by the formulas:

$$a_A / a_H \text{ and } a_S / a_H.$$

Plot the *Standard curves* of the values of  $R_A$  and  $R_S$  against the amounts, in mg, of atropine and scopolamine in the solutions. (The ratio of the molecular weight of atropine to that of anhydrous atropine sulfate is 0.8551, and the ratio of the molecular weight of scopolamine to that of anhydrous scopolamine hydrobromide is 0.7894.) Inject a portion of the *Assay preparation* into the chromatograph, obtain the chromatogram area ratios, measure the peak areas, and calculate the area ratios, as with the *Standard solutions*. Record from the *Standard curve* the quantities, in mg, of atropine and scopolamine in the volume of specimen taken. Add the quantity, in mg, of atropine and scopolamine, and multiply by 10 to obtain the weight, in mg, of alkaloids in the portion of Extract taken.

## Belladonna Extract Tablets

» Belladonna Extract Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of the alkaloids of belladonna leaf.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Atropine Sulfate RS

USP Homatropine Hydrobromide RS

USP Scopolamine Hydrobromide RS

**Identification**—Macerate a quantity of powdered Tablets, equivalent to about 5 mg of the alkaloids of belladonna extract, with 20 mL of water, and transfer to a separator. Render the solution alkaline with 6 N ammonium hydroxide, and extract the alkaloids with 50 mL of chloroform. Filter the chloroform layer, divide it into two equal portions, and evaporate to dryness: the residue responds to the following tests.

**A:** To one portion of the dry residue add 2 drops of nitric acid, evaporate on a steam bath to dryness, and add a few drops of alcoholic potassium hydroxide TS: a violet color is produced.

**B:** Dissolve the other portion of the residue in 1 mL of dilute hydrochloric acid (1 in 120), and add gold chloride TS, dropwise with shaking, until a definite precipitate separates. Slowly heat until the precipitate dissolves, and allow the solution to cool: a lusterless precipitate is produced.

**Disintegration** <701>: 30 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay**—

pH 9.5 Phosphate buffer, *Internal standard solution*, *Standard preparation*, *Extraction blank*, *Standard curve*, *Chromatographic system*, and *System suitability*—Proceed as directed in the Assay under *Belladonna Extract*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 600  $\mu$ g of atropine and scopolamine, to a 60-mL separator, add 10.0 mL of dilute sulfuric acid (1 in 350), and sonicate to dissolve as much as possible of the specimen. Proceed as directed for *Assay preparation* in the Assay under *Belladonna Leaf*, beginning with "add 1.0 mL of *Internal standard solution*."

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Belladonna Extract*. Record from the *Standard curves*

the quantities, in mg, of atropine and scopolamine in the weight of specimen taken.

## Belladonna Tincture

» Belladonna Tincture yields, from each 100 mL, not less than 27 mg and not more than 33 mg of the alkaloids of belladonna leaf.

Belladonna Leaf, in moderately coarse powder .....	100 g
To make about .....	1000 mL

Prepare a tincture by *Process P* as modified for assayed *Tinctures* (see *Pharmaceutical Dosage Forms* (1151)), using a mixture of 3 volumes of alcohol and 1 volume of water as the menstruum. Finally adjust the Tincture to contain, in each 100 mL, 30 mg of the alkaloids of belladonna leaf.

**Packaging and storage**—Preserve in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat.

### USP Reference standards (11)—

USP Atropine Sulfate RS

USP Homatropine Hydrobromide RS

USP Scopolamine Hydrobromide RS

**Alcohol content**, *Method II* (611): between 65.0% and 70.0% of C<sub>2</sub>H<sub>5</sub>OH, determined by the gas-liquid chromatographic procedure, acetone being used as the internal standard.

### Assay—

pH 9.5 Phosphate buffer, Internal standard solution, Standard preparation, Extraction blank, Standard curve, Chromatographic system, and System suitability—Proceed as directed in the Assay under *Belladonna Extract*.

**Assay preparation**—Proceed with Tincture as directed in the Assay under *Belladonna Leaf*, but pipet 2 mL of Tincture (in place of "10 mL of this solution") into a 60-mL separator containing 10 mL of dilute sulfuric acid (1 in 350).

**Procedure**—Proceed as directed in the Assay under *Belladonna Leaf*. Record from the *Standard curve* the quantities, in mg, of atropine and scopolamine in the specimen. Add the quantity, in mg, of atropine and scopolamine, and multiply by 50 to obtain the weight, in mg, of alkaloids per 100 mL.

## Benazepril Hydrochloride

C<sub>24</sub>H<sub>28</sub>N<sub>2</sub>O<sub>5</sub> · HCl 460.95

1*H*-1-Benzazepine-1-acetic acid, 3-[[1-(ethoxycarbonyl)-3-phenylpropyl]amino]-2,3,4,5-tetrahydro-2-oxo-, monohydrochloride, [*S*-(*R*\*,*R*\*)]-.

(3*S*)-3-[[1-(1*S*)-1-Carboxy-3-phenylpropyl]amino]-2,3,4,5-tetrahydro-2-oxo-1*H*-1-benzazepine-1-acetic acid, 3-ethyl ester, monohydrochloride [86541-74-4].

» Benazepril Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of C<sub>24</sub>H<sub>28</sub>N<sub>2</sub>O<sub>5</sub> · HCl, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, and store at a temperature below 30°, preferably between 15° and 30°.

### USP Reference standards (11)—

USP Benazepril Hydrochloride RS

USP Benazepril Related Compound A RS

(3*R*) 3-[[1-(1*R*) 1-(Ethoxycarbonyl)-3-phenylpropyl]amino]-2,3,4,5-tetrahydro-2-oxo-1*H*-1-benzazepine-1-acetic acid, monohydrochloride.

C<sub>24</sub>H<sub>34</sub>N<sub>2</sub>O<sub>5</sub> · HCl 467.00

USP Benazepril Related Compound E RS

3-Amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine-1-acetic acid.

USP Benazepril Related Compound F RS

*tert*-Butyl-3-amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine-1-acetic acid.

USP Benazepril Related Compound G RS

(3-(1-Ethoxycarbonyl-3-phenyl-1(*S*)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1*H*-1-(3*S*)-benzazepine)-1-acetic acid ethyl ester.

### Identification—

**A: Infrared Absorption** (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

**C:** It responds to the test for *Chloride* (191).

**Absorbance of solution**—The absorbance of a 1 in 100 solution of it in methanol, determined in a 1-cm cell at 420 nm, is not more than 0.015, methanol being used as the blank.

### Absorptivity—

**Test preparation**—Dissolve an accurately weighed quantity of Benazepril Hydrochloride in methanol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.025 mg per mL.

**Procedure**—Proceed as directed under *Spectrophotometry and Light-Scattering* (851), and measure the absorbance at 238 nm: the absorptivity is between 21.0 and 23.2.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 1.5% of its weight.

**Residue on ignition** (281)—Ignite at 600°. Not more than 0.1% residue is found.

**Heavy metals**, *Method II* (231): 0.001%.

### Related compounds—

TEST 1 (FOR BENAZEPRIL RELATED COMPOUND A)—

pH 6.0 Phosphate buffer—Dissolve 9.66 g of monobasic potassium phosphate and 2.68 g of dibasic sodium phos-

phate, heptahydrate in about 900 mL of water, and dilute with water to 1000 mL.

**Mobile phase**—Prepare a filtered and degassed mixture of pH 6.0 Phosphate buffer and methanol (80:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Resolution solution**—Dissolve accurately weighed quantities of USP Benazepril Hydrochloride RS and USP Benazepril Related Compound A RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 1.0 mg per mL and 0.005 mg per mL, respectively.

**Standard stock solution**—Dissolve an accurately weighed quantity of USP Benazepril Related Compound A RS in *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

**Standard solution**—Dilute a suitable portion of *Standard stock solution*, accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 5 µg per mL.

**Dilute standard solution**—Dilute a suitable portion of *Standard stock solution*, accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 1 µg per mL.

**Test solution**—Transfer about 50 mg of Benazepril Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 4.0-mm × 10-cm column that contains packing L41. The flow rate is about 0.9 mL per minute. The column temperature is maintained at 30°. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between benazepril hydrochloride and benazepril related compound A is not less than 2.0. Chromatograph the *Dilute standard solution*, and record the peak responses as directed for *Procedure*: the signal-to-noise ratio is not less than 10:1. Chromatograph the *Standard solution*: the relative standard deviation for replicate injections determined from the benazepril related compound A peak is not more than 10%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the area for the benazepril related compound A peak. Calculate the percentage of benazepril related compound A in the portion of Benazepril Hydrochloride taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Benazepril Related Compound A RS in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of Benazepril Hydrochloride in the *Test solution*;  $r_U$  is the peak response for benazepril related compound A obtained from the *Test solution*; and  $r_S$  is the peak response for benazepril related compound A obtained from the *Standard solution*: The limit of benazepril related compound A is given in the table below.

Benazepril Related Compound	Relative Retention Time	Limit (%)
A <sup>1</sup>	2.3	0.1

<sup>1</sup>[(3R)-3-[[[(1R)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]-2,3,4,5-tetrahydro-2-oxo-1H-1-benzazepine-1-acetic acid, monohydrochloride]

TEST 2 (FOR BENAZEPRIL RELATED COMPOUNDS B, C, D, E, F, AND G)—

**Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, and Chromatographic system**—Proceed as directed in the Assay.

**Standard solution**—Dissolve accurately weighed quantities of USP Benazepril Hydrochloride RS, USP Benazepril Related Compound B RS, USP Benazepril Related Compound C RS, USP Benazepril Related Compound D RS, USP Benazepril Related Compound E RS, USP Benazepril Related Compound F RS, and USP Benazepril Related Compound G RS in *Mobile phase* to obtain a solution having known concentrations of about 1 µg of USP Benazepril Hydrochloride RS per mL and 10 µg of each related compound per mL.

**Test solution**—Transfer about 50 mg of Benazepril Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Procedure**—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the percentage of benazepril related compounds in the portion of Benazepril Hydrochloride taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of the relevant USP Reference Standard in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of benazepril hydrochloride in the *Test solution*;  $r_U$  is the peak response for the relevant benazepril related compound obtained from the *Test solution*; and  $r_S$  is the peak response for the relevant benazepril related compound obtained from the *Standard solution* (see *Table 1* for values).

Table 1

Benazepril Related Compound	Relative Retention Time	Limit (%)
E <sup>1</sup>	0.4	0.2
F <sup>2</sup>	0.5	0.2
C <sup>3</sup>	0.6	0.3
B <sup>4</sup>	1.5	0.5
D <sup>5</sup>	1.7	0.2
G <sup>6</sup>	2.0	0.2

<sup>1</sup>3-Amino-2,3,4,5-tetrahydro-2-oxo-1H-1-(3S)-benzazepine-1-acetic acid

<sup>2</sup>t-Butyl-3-amino-2,3,4,5-tetrahydro-2-oxo-1H-1-(3S)-benzazepine-1-acetic acid

<sup>3</sup>3-(1-Carboxy-3-phenyl-(1S)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1H-1-(3S)-benzazepine-1-acetic acid

<sup>4</sup>Mixture of diastereoisomers (3-(1-ethoxycarbonyl-3-phenyl-(1R)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1H-1-(3S)-benzazepine)-1-acetic acid and (3-(1-ethoxycarbonyl-3-phenyl-(1S)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1H-1-(3R)-benzazepine)-1-acetic acid

<sup>5</sup>3-(1-Ethoxycarbonyl-3-cyclohexyl-(1S)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1H-1-(3S)-benzazepine)-1-acetic acid monohydrochloride

<sup>6</sup>3-(1-Ethoxycarbonyl-3-phenyl-(1S)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1H-1-(3S)-benzazepine)-1-acetic acid ethyl ester

In addition to not exceeding the limits for benazepril related compounds in *Table 1*, not more than 0.1% of any other single impurity is found; [NOTE—For calculating any other single unspecified impurity,  $C_S$  is the concentration of the USP Benazepril Hydrochloride RS in the *Standard solution*.] and not more than 2.0% of total impurities (excluding benazepril related compound A from *Test 1*) is found.

#### Assay—

**Tetrabutylammonium bromide solution**—Dissolve 0.81 g of tetrabutylammonium bromide in 360 mL of water containing 0.2 mL of glacial acetic acid.

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and *Tetrabutylammonium bromide solution* (64:36).

Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Dissolve accurately weighed quantities of USP Benazepril Hydrochloride RS and USP Benazepril Related Compound B RS in *Mobile phase* to obtain a solution having known concentrations of about 0.4 mg of each per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Benazepril Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

**Assay preparation**—Transfer about 10.0 mL of the *Test solution* (from either *Test 1* or *Test 2*), prepared as directed in the test for *Related compounds*, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 3-cm guard column that contains packing L1 connected to a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between benazepril hydrochloride and benazepril related compound B is not less than 1.7; and the relative standard deviation for replicate injections determined from benazepril hydrochloride and benazepril related compound B is not more than 2.0% for each.

**Procedure**—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg, of  $C_{24}H_{28}N_2O_5 \cdot HCl$  in the portion of Benazepril Hydrochloride taken by the formula:

$$250C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Benazepril Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Benazepril Hydrochloride Tablets

» Benazepril Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of benazepril hydrochloride ( $C_{24}H_{28}N_2O_5 \cdot HCl$ ).

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

### USP Reference standards <11>—

USP Benazepril Hydrochloride RS

USP Benazepril Related Compound B RS

(3S) 3-[[[(1R) 1-(Ethoxycarbonyl)-3-phenylpropyl]amino]-2,3,4,5-tetrahydro-2-oxo-1H-1-benzazepine-1-acetic acid, monohydrochloride.

$C_{24}H_{28}N_2O_5 \cdot HCl$  460.95

USP Benazepril Related Compound C RS

3-(1-Carboxy-3-phenyl-1(S)-propyl)amino-2,3,4,5-tetrahydro-2-oxo-1H-1-(3S)-benzazepine-1-acetic acid.

$C_{22}H_{24}N_2O_5$  396.44

### Identification—

**A: Thin-Layer Chromatographic Identification Test** <201>—

**Test solution**—Finely powder not fewer than 20 Tablets, and transfer an accurately weighed portion of the powder, equivalent to about 50 mg of benazepril hydrochloride, to a

50-mL volumetric flask. Add about 30 mL of methanol, and shake by mechanical means for 15 minutes. Dilute with methanol to volume, mix, and centrifuge. Pass an aliquot of the supernatant through a suitable filter, discarding the first 6 mL of the filtrate.

**Application volume:** 20  $\mu$ L.

**Developing solvent system:** a mixture of ethyl acetate, methanol, and ammonium hydroxide (80:20:15).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution <711>—

**TEST 1—**

**Medium:** water, 500 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

Determine the amount of  $C_{24}H_{28}N_2O_5 \cdot HCl$  dissolved by employing the following method.

**Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, and Chromatographic system**—Proceed as directed in the *Assay* under *Benazepril Hydrochloride*.

**Procedure**—Inject about 60  $\mu$ L, or an amount of a filtered portion of the solution under test, equivalent to about 1.2  $\mu$ g of benazepril, into the chromatograph. The amount of benazepril injected should not exceed 1.5  $\mu$ g. Record the chromatogram, and measure the responses for the major peaks. Determine the quantity, in mg, of  $C_{24}H_{28}N_2O_5 \cdot HCl$  dissolved in comparison with a *Standard solution* having a known concentration of USP Benazepril Hydrochloride RS in the same *Medium* and similarly chromatographed.

**Tolerances**—Not less than 80% ( $Q$ ) of the labeled amount of  $C_{24}H_{28}N_2O_5 \cdot HCl$  is dissolved in 30 minutes.

**TEST 2**—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium, Apparatus, and Procedure**—Proceed as directed for *Test 1*.

**Time:** 45 minutes.

**Tolerances**—Not less than 70% ( $Q$ ) of the labeled amount of  $C_{24}H_{28}N_2O_5 \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

**Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay*.

**Test preparation**—Transfer 1 Tablet to a suitable volumetric flask, add a volume of *Mobile phase* equivalent to about 50% of the volume of the flask, sonicate for 5 minutes, and then shake by mechanical means for not less than 10 minutes. Dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a final concentration of about 0.2 mg per mL, mix, and pass a portion of the solution through a suitable filter, discarding the first 6 mL of the filtrate.

**Procedure**—Proceed as directed in the *Assay*, except to inject the *Test preparation* instead of the *Assay preparation*. Calculate the quantity, in mg, of benazepril hydrochloride ( $C_{24}H_{28}N_2O_5 \cdot HCl$ ) in the Tablet taken by the formula:

$$VDC(r_U / r_S)$$

in which  $V$  is the volume, in mL, of the initial flask used to prepare the *Test preparation*;  $D$  is the dilution factor in subsequent dilutions of  $V$ , if necessary, to prepare the *Test preparation*;  $C$  is the concentration, in mg per mL, of USP Benazepril Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the benazepril hydrochloride peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively.

**Related compounds—**

*Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, and Chromatographic system—*Proceed as directed in the Assay.

**Standard solution—**Dissolve an accurately weighed quantity of USP Benazepril Related Compound C RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.006 mg per mL.

**Test solution—**Use the Assay preparation.

**Procedure—**Separately inject equal volumes (about 80  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses of the peaks for benazepril related compound C. Calculate the percentage of benazepril related compound C in the portion of Tablets taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Benazepril Related Compound C RS in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of benazepril hydrochloride in the *Test solution*; and  $r_U$  and  $r_S$  are the peak responses for benazepril related compound C obtained from the *Test solution* and the *Standard solution*, respectively: not more than 3.0% of benazepril related compound C is found. Calculate the percentage of each impurity (other than benazepril related compound C) in the portion of Tablets taken by the formula:

$$100(r_i / r_S)$$

in which  $r_i$  is the peak response for each impurity obtained from the *Test solution*; and  $r_S$  is the sum of the responses of all the peaks (including benazepril related compound C): not more than 1.0% of any individual impurity is found; and not more than 2.0% of total impurities is found, the results for all impurities (excluding benazepril related compound C) being added.

**Assay—**

*Tetrabutylammonium bromide solution, Mobile phase, System suitability solution, Standard preparation, and Chromatographic system—*Proceed as directed in the Assay under Benazepril Hydrochloride.

**Assay preparation—**Finely powder not fewer than 20 Tablets, and transfer an accurately weighed portion of the powder, equivalent to about 50 mg of benazepril hydrochloride, to a 250-mL volumetric flask. Add about 150 mL of *Mobile phase*, and shake by mechanical means for 30 minutes. Dilute with *Mobile phase* to volume, mix, and centrifuge. Pass an aliquot of the supernatant through a suitable filter, discarding the first 6 mL of the filtrate.

**Procedure—**Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the quantity, in mg, of benazepril hydrochloride ( $C_{24}H_{28}N_2O_5 \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$250C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Benazepril Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the benazepril hydrochloride peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Bendroflumethiazide**

$C_{15}H_{14}F_3N_3O_4S_2$  421.41  
2*H*-1,2,4-Benzothiadiazine-7-sulfonamide, 3,4-dihydro-3-(phenylmethyl)-6-(trifluoromethyl)-, 1,1-dioxide, ( $\pm$ ); ( $\pm$ )-3-Benzyl-3,4-dihydro-6-(trifluoromethyl)-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide [73-48-3].

**DEFINITION**

Bendroflumethiazide contains NLT 98.0% and NMT 102.0% of  $C_{15}H_{14}F_3N_3O_4S_2$ , calculated on the anhydrous basis.

**IDENTIFICATION****A. INFRARED ABSORPTION** (197K)

**Sample:** Previously dried over silica gel for 4 h

**Acceptance criteria:** Meets the requirements

**B. ULTRAVIOLET ABSORPTION** (197U)

**Analytical wavelength:** 271 nm

**Sample solution:** 10  $\mu$ g/mL in methanol

**Acceptance criteria:** Absorptivities, calculated on the anhydrous basis, do not differ by more than 4.0%.

**C.**

**Sample solution:** Mix 5 mL of dilute hydrochloric acid (50% v/v) with 20 mg of Bendroflumethiazide, boil gently for 1 min, and cool in an ice bath.

**Analysis:** To the *Sample solution* add, in succession, 0.5 mL of sodium nitrite solution (1 mg/mL), 0.5 mL of ammonium sulfamate solution (5 mg/mL), and 0.5 mL of *N*-(1-naphthyl)ethylenediamine dihydrochloride solution (1 mg/mL).

**Acceptance criteria:** A deep red color is produced.

**ASSAY****PROCEDURE**

**Sample:** 190 mg of Bendroflumethiazide

**Analysis:** Dissolve the *Sample* in 80 mL of pyridine in a tall-form, 250-mL beaker in a well-ventilated hood. Add 3 drops of a saturated solution of azo violet in methanol, cover the beaker, and gently bubble nitrogen through the solution for 5 min, being careful to avoid any contact between the solution and the cover. Raise the nitrogen delivery tube above the solution surface and, maintaining a gentle flushing with nitrogen and stirring with a magnetic or mechanical stirring device, add 0.1 N sodium methoxide VS from a 10-mL buret inserted through an opening in the cover. Titrate to a blue endpoint, approaching the endpoint at a rate of 1 or 2 drop/s. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N sodium methoxide is equivalent to 21.07 mg of  $C_{15}H_{14}F_3N_3O_4S_2$ .

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES****RESIDUE ON IGNITION** (281): NMT 0.2%**HEAVY METALS, Method II** (231): 20 ppm**SELENIUM** (291)

**Sample:** 100 mg of Bendroflumethiazide and 100 mg of magnesium oxide

**Acceptance criteria:** The absorbance from the *Test solution* is NMT one-half that from the *Standard solution* (NMT 30 ppm).

**LIMIT OF 2,4-DISULFAMYL-5-TRIFLUOROMETHYLANILINE**

[NOTE—Use low-actinic glassware for the *Standard solution* and the *Sample solution*.]

**Mobile phase:** Dissolve 5.62 g of sodium chloride and 1.97 g of anhydrous sodium sulfate in 1000 mL of

water in a 2-L volumetric flask. Add 4.0 mL of glacial acetic acid and 800 mL of methanol, and dilute with water to volume.

**Standard solution:** 0.75 µg/mL of USP 2,4-Disulfamyl-5-trifluoromethylaniline RS in methanol

**Sample solution:** 50 µg/mL of Bendroflumethiazide in methanol

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm

**Column:** 4.6-mm × 30-cm; packing L11

**Column temperature:** 35° ± 5°

**Flow rate:** 1.5 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.4 between the methanol and 2,4-disulfamyl-5-trifluoromethylaniline peaks

**Relative standard deviation:** NMT 3.0% for five replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of 2,4-disulfamyl-5-trifluoromethylaniline in the portion of Bendroflumethiazide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP 2,4-Disulfamyl-5-trifluoromethylaniline RS in the *Standard solution* (µg/mL)

$C_U$  = concentration of Bendroflumethiazide in the *Sample solution* (µg/mL)

**Acceptance criteria:** NMT 1.5%

#### SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* <921>: NMT 0.5%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** <11>
  - USP Bendroflumethiazide RS
  - USP 2,4-Disulfamyl-5-trifluoromethylaniline RS
  - C<sub>7</sub>H<sub>8</sub>F<sub>3</sub>N<sub>3</sub>O<sub>4</sub>S<sub>2</sub> 319.29

## Bendroflumethiazide Tablets

#### DEFINITION

Bendroflumethiazide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bendroflumethiazide (C<sub>15</sub>H<sub>14</sub>F<sub>3</sub>N<sub>3</sub>O<sub>4</sub>S<sub>2</sub>).

#### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### PROCEDURE

[NOTE—Use low-actinic glassware for the *Sample solution* and the *Standard solution*.]

**Mobile phase:** Dissolve 5.62 g of sodium chloride and 1.97 g of anhydrous sodium sulfate in 1000 mL of water in a 2-L volumetric flask. Add 4.0 mL of glacial

acetic acid and 800 mL of methanol, and dilute with water to volume.

**Standard solution:** 50 µg/mL of USP Bendroflumethiazide RS in methanol

**Sample solution:** Nominally equivalent to 50 µg/mL from finely powdered Tablets (NLT 20). Initially add methanol (70% of the volume of the flask) and sonicate for 15 min with occasional shaking. Dilute further with methanol to the required concentration, and centrifuge for 15 min.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm

**Column:** 4.6-mm × 30-cm; packing L11

**Temperature:** 35 ± 5°

**Flow rate:** 1.5 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 3.0% for five replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>15</sub>H<sub>14</sub>F<sub>3</sub>N<sub>3</sub>O<sub>4</sub>S<sub>2</sub> in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Bendroflumethiazide RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of bendroflumethiazide in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### DISSOLUTION <711>

[NOTE—Protect solutions from light throughout this test.]

**Medium:** 0.01 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Detector:** UV 271 nm

**Sample solution:** Sample per *Dissolution* <711>.

**Standard solution:** Prepare a stock solution of USP Bendroflumethiazide RS in an appropriate organic solvent, and dilute this solution with *Medium* to obtain a final concentration similar to the one expected in the *Sample solution*.

**Analysis:** Determine the amount of C<sub>15</sub>H<sub>14</sub>F<sub>3</sub>N<sub>3</sub>O<sub>4</sub>S<sub>2</sub> dissolved by using UV absorption on filtered portions of the *Sample solution*, suitably diluted with water, if necessary, in comparison with a *Standard solution* having a known concentration of USP Bendroflumethiazide RS.

**Tolerances:** NLT 75% (Q) of the labeled amount of C<sub>15</sub>H<sub>14</sub>F<sub>3</sub>N<sub>3</sub>O<sub>4</sub>S<sub>2</sub> is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** <11>
  - USP Bendroflumethiazide RS

## Benoxinate Hydrochloride

$C_{17}H_{28}N_2O_3 \cdot HCl$  344.88

Benzoic acid, 4-amino-3-butoxy-, 2-(diethylamino)ethyl ester, monohydrochloride.

2-(Diethylamino)ethyl 4-amino-3-butoxybenzoate monohydrochloride [5987-82-6].

» Benoxinate Hydrochloride contains not less than 98.5 percent and not more than 101.5 percent of  $C_{17}H_{28}N_2O_3 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Benoxinate Hydrochloride RS

**Identification**—

**A:** *Infrared Absorption* (197K): previously dried.

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 15 µg per mL.

*Medium:* water.

**C:** A solution (1 in 100) responds to the tests for *Chloride* (191).

**pH** (791): between 5.0 and 6.0, in a solution (1 in 100).

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Ordinary impurities** (466)—

*Test solution:* methanol.

*Standard solution:* methanol.

*Eluant:* a mixture of chloroform, cyclohexane, and diethylamine (5:4:1).

*Visualization:* 12.

**Assay**—Dissolve about 250 mg of Benoxinate Hydrochloride, accurately weighed, in a mixture of 20 mL of glacial acetic acid and 20 mL of acetic anhydride, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 34.49 mg of  $C_{17}H_{28}N_2O_3 \cdot HCl$ .

## Benoxinate Hydrochloride Ophthalmic Solution

» Benoxinate Hydrochloride Ophthalmic Solution is a sterile solution of Benoxinate Hydrochloride in water. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_{17}H_{28}N_2O_3 \cdot HCl$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Benoxinate Hydrochloride RS

**Identification**—Dilute a volume of Solution, equivalent to about 50 mg of benoxinate hydrochloride, with 0.01 N hy-

drochloric acid to 25 mL, and proceed as directed under *Identification—Organic Nitrogenous Bases* (181), beginning with "Transfer the liquid to a separator": the solution meets the requirements of the test.

**Sterility** (71): meets the requirements.

**pH** (791): between 3.0 and 6.0.

**Assay**—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Benoxinate Hydrochloride RS in 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 400 µg per mL.

**Assay preparation**—Transfer a volume of Ophthalmic Solution, equivalent to about 20 mg of benoxinate hydrochloride, to a separator containing 15 mL of water, add 1 mL of ammonium hydroxide, and extract with five 20-mL portions of ether. Wash the combined ether extracts with 10 mL of water, extract the water washing with 10 mL of ether, and add this ether extract to the main extract. Extract the ether solution with three 5-mL portions of 0.1 N hydrochloric acid, collect the acid extracts in a 50-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

**Procedure**—Transfer 5.0 mL each of the *Standard preparation*, the *Assay preparation*, and 0.1 N hydrochloric acid to provide a blank, to separate 200-mL volumetric flasks. Dilute the contents of each flask with water to volume, and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 308 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of  $C_{17}H_{28}N_2O_3 \cdot HCl$  in each mL of the Ophthalmic Solution taken by the formula:

$$(0.05C / V)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Benoxinate Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Ophthalmic Solution taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Benzethonium Chloride

$C_{27}H_{42}ClNO_2$

448.08

Benzenemethanaminium, *N,N*-dimethyl-*N*-[2-[2-[4-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethyl]-, chloride; Benzyldimethyl[2-[2-[*p*-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethyl]ammonium chloride [121-54-0].

**DEFINITION**

Benzethonium Chloride contains NLT 97.0% and NMT 103.0% of  $C_{27}H_{42}ClNO_2$ , calculated on the dried basis.

**IDENTIFICATION**

• **A. PROCEDURE**

**Sample solution:** 10 mg/mL

**Analysis:** To 1 mL of the *Sample solution* add 2 mL of alcohol, 0.5 mL of 2 N nitric acid, and 1 mL of silver nitrate TS.

**Acceptance criteria:** A white precipitate, which is insoluble in 2 N nitric acid but soluble in 6 N ammonium hydroxide, is formed.

• **B. INFRARED ABSORPTION** (197K)

**ASSAY**

• **PROCEDURE**

**Sample:** 0.3 g of Benzethonium Chloride

**Analysis:** Dissolve the *Sample* in 75 mL of water contained in a glass-stoppered, 250-mL flask. Add 0.4 mL of bromophenol blue solution (1 in 2000), 10 mL of chloroform, and 1 mL of 1 N sodium hydroxide. Titrate with 0.02 M sodium tetraphenylboron VS until the blue color disappears from the chloroform layer. Add the last portions of the sodium tetraphenylboron solution dropwise, agitating vigorously after each addition. Each mL of 0.02 M sodium tetraphenylboron is equivalent to 8.962 mg of  $C_{27}H_{42}ClNO_2$ .

**Acceptance criteria:** 97.0%–103.0% on the dried basis

**IMPURITIES**

**Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.1%

**Organic Impurities**

- **PROCEDURE: LIMIT OF AMMONIUM COMPOUNDS:** To 5 mL of a solution (1 in 50) add 3 mL of 1 N sodium hydroxide, and heat to boiling: the odor of ammonia is not perceptible.

**SPECIFIC TESTS**

- **MELTING RANGE OR TEMPERATURE** (741): 158°–163°, the specimen having been dried previously
- **LOSS ON DRYING** (731): Dry a sample at 105° for 4 h: it loses NMT 5.0% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
USP Benzethonium Chloride RS

## Benzethonium Chloride Concentrate

» Benzethonium Chloride Concentrate contains not less than 94.0 percent and not more than 106.0 percent of the labeled amount of benzethonium chloride ( $C_{27}H_{42}ClNO_2$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at room temperature.

**Labeling**—The label states that this article is not intended for direct administration to humans or animals.

**Change to read:**

**Identification—**

• **A.**  
Evaporate a volume of Concentrate, equivalent to 200 mg of benzethonium chloride, on a steam bath. To the residue add 2 mL of alcohol, 0.5 mL of 2 N nitric acid, and 1 mL of silver nitrate TS. A white precipitate, which is insoluble in 2 N nitric acid but soluble in 6 N ammonium hydroxide, is formed.

• **B.**  
Evaporate a volume of Concentrate, equivalent to 200 mg of benzethonium chloride, on a steam bath. The residue so obtained forms precipitate with 2 N nitric acid and with mercuric chloride TS, both of which dissolve upon the addition of alcohol.

• **C.**  
Evaporate a volume of Concentrate, equivalent to 200 mg of benzethonium chloride, on a steam bath. To the residue

add 0.1 g of potassium nitrate, and heat on a steam bath for 3 min. Cautiously dilute the solution with water to 10 mL, add 0.5 g of granulated zinc, and warm the mixture for 10 min. Cool. Add 0.2 g of sodium nitrite to 1 mL of the clear liquid, and add this mixture to 20 mg of naphthol dipotassium disulfonate or naphthol disodium disulfonate in 1 mL of ammonium hydroxide. The solution turns orange-red, and a brown precipitate may be formed. • (ERR 1-May-2012)

**Oxidizing substances**—To 5 mL of Concentrate add 0.5 mL of potassium iodide TS and a few drops of 3 N hydrochloric acid: the solution does not acquire a yellow color.

**Limit of nitrites**—To 1 drop of Concentrate on a spot plate add 1 drop each of glacial acetic acid, sulfanilic acid in acetic acid solution (1 in 100), and 1-naphthylamine-acetic acid solution (prepared by boiling 30 mg of 1-naphthylamine in 70 mL of water, decanting the colorless solution from the blue-violet residue, and mixing with 30 mL of glacial acetic acid): no red color develops in the resulting solution within 10 minutes.

**Assay**—Transfer a volume of Concentrate, equivalent to about 200 mg of benzethonium chloride, to a glass-stoppered flask, and proceed as directed in the Assay under *Benzethonium Chloride*, beginning with "Add 0.4 mL of bromophenol blue solution (1 in 2000)."

## Benzethonium Chloride Topical Solution

» Benzethonium Chloride Topical Solution contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of benzethonium chloride ( $C_{27}H_{42}ClNO_2$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Change to read:**

**Identification—**

• **A.**  
Evaporate a volume of Topical Solution, equivalent to 200 mg of benzethonium chloride, on a steam bath. To the residue add 2 mL of alcohol, 0.5 mL of 2 N nitric acid, and 1 mL of silver nitrate TS. A white precipitate, which is insoluble in 2 N nitric acid but soluble in 6 N ammonium hydroxide, is formed.

• **B.**  
Evaporate a volume of Topical Solution, equivalent to 200 mg of benzethonium chloride, on a steam bath. The residue so obtained forms precipitate with 2 N nitric acid and with mercuric chloride TS, both of which dissolve upon the addition of alcohol.

• **C.**  
Evaporate a volume of Topical Solution, equivalent to 200 mg of benzethonium chloride, on a steam bath. To the residue add 0.1 g of potassium nitrate, and heat on a steam bath for 3 min. Cautiously dilute the solution with water to 10 mL, add 0.5 g of granulated zinc, and warm the mixture for 10 min. Cool. Add 0.2 g of sodium nitrite to 1 mL of the clear liquid, and add this mixture to 20 mg of naphthol dipotassium disulfonate or naphthol disodium disulfonate in 1 mL of ammonium hydroxide. The solution turns orange-red, and a brown precipitate may be formed. • (ERR 1-May-2012)

**Oxidizing substances**—To 5 mL add 0.5 mL of potassium iodide TS and a few drops of 3 N hydrochloric acid: the solution does not acquire a yellow color.

**Limit of nitrites**—To 1 drop of Topical Solution on a spot plate add 1 drop each of glacial acetic acid, sulfanilic acid in

acetic acid (1 in 100), and 1-naphthylamine–acetic acid solution (prepared by boiling 30 mg of 1-naphthylamine in 70 mL of water, decanting the colorless solution from the blue-violet residue, and mixing with 30 mL of glacial acetic acid): no red color develops in the resulting solution within 10 minutes.

**Assay**—Transfer a volume of Topical Solution, equivalent to about 200 mg of benzethonium chloride, to a glass-stoppered flask, and proceed as directed in the Assay under *Benzethonium Chloride*, beginning with “Add 0.4 mL of bromophenol blue solution (1 in 2000)”.

## Benzethonium Chloride Tincture

### DEFINITION

Benzethonium Chloride Tincture contains, in each 100 mL, NLT 190 mg and NMT 210 mg of benzethonium chloride ( $C_{27}H_{42}ClNO_2$ ).

Prepare Benzethonium Chloride Tincture 2 mg/mL as follows.

Benzethonium Chloride	2 g
Alcohol	685 mL
Acetone	100 mL
Purified Water, a sufficient quantity to make	1000 mL

Dissolve the *Benzethonium Chloride* in a mixture of *Alcohol* and *Acetone*. Add sufficient *Purified Water* to make 1000 mL. [NOTE—Benzethonium Chloride Tincture may be colored by the addition of any suitable color or combination of colors certified by the FDA for use in drugs.]

### IDENTIFICATION

#### A. PROCEDURE

**Sample:** 50 mL

**Analysis:** To the residue obtained by evaporating the *Sample* on a steam bath, add 2 mL of alcohol, 0.5 mL of 2 N nitric acid, and 1 mL of silver nitrate TS.

**Acceptance criteria:** A white precipitate, which is insoluble in 2 N nitric acid but soluble in 6 N ammonium hydroxide, is formed.

#### B. PROCEDURE

**Sample:** 50 mL

**Analysis:** Evaporate the *Sample* on a steam bath.

**Acceptance criteria:** The residue obtained forms precipitates with 2 N nitric acid and with mercuric chloride TS, both of which dissolve upon the addition of alcohol.

### ASSAY

#### PROCEDURE

**Sample:** 50 mL

**Analysis:** Transfer the *Sample* to a 150-mL beaker, and add, with continuous stirring, 10 mL of 25 mg/mL of sodium tetraphenylboron solution. Cover, and allow to stand for 16 h. Decant the supernatant into a tared sintered-glass crucible, applying vacuum filtration. Suspend the precipitate in 20 mL of water. Transfer the precipitate to the crucible, washing well with water. Dry the precipitate and the crucible at 105° for 1 h, cool, and weigh. The weight of the precipitate so obtained, multiplied by 0.6122, represents its equivalent of benzethonium chloride ( $C_{27}H_{42}ClNO_2$ ).

**Acceptance criteria:** 190–210 mg

### OTHER COMPONENTS

#### ALCOHOL AND ACETONE CONTENT

**Standard solution A (alcohol low standard solution):** Add 5.0 mL of methanol and 11.0 mL of dehy-

drated alcohol to a 100-mL volumetric flask, and dilute with water to volume.

#### Standard solution B (alcohol high standard solution):

Add 5.0 mL of methanol and 14.0 mL of dehydrated alcohol to a 100-mL volumetric flask, and dilute with water to volume.

#### Standard solution C (acetone low standard solution):

Add 5.0 mL of methanol and 1.7 mL of acetone to a 100-mL volumetric flask, and dilute with water to volume.

#### Standard solution D (acetone high standard solution):

Add 5.0 mL of methanol and 2.2 mL of acetone to a 100-mL volumetric flask, and dilute with water to volume.

**Sample solution:** Transfer 20 mL of Tincture to a 100-mL volumetric flask, add 5.0 mL of methanol as the internal standard, and dilute with water to volume.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 120-cm × 4-mm packed with a suitable type of support, such as 80- to 100-mesh S3

**Carrier gas:** Dry helium

**Temperature**

**Injector port:** 240°

**Detector block:** 240°

**Column:** 120°

**Flow rate:** 90 mL/min

**Injection size:** 0.8 µL

### Analysis

**Samples:** *Standard solutions A, B, C, and D, and Sample solution*

From the respective chromatograms obtained as described previously, calculate the ratios of peak areas for alcohol to internal standard and for acetone to internal standard.

Calculate the percentage of alcohol and of acetone in the portion of Tincture taken:

$$\text{Result} = [A(Y - Z) + B(Z - X)] / (Y - X)$$

*A* = percentage of alcohol, or of acetone, in *Standard solution A* and *Standard solution C*, respectively

*Y* = ratio of the alcohol peak areas, or the acetone peak areas, to the internal standard peak areas for *Standard solution B* and *Standard solution D*, respectively

*Z* = ratio of the alcohol peak areas, or the acetone peak areas, to the internal standard peak areas for the *Sample solution*

*B* = percentage of alcohol, or of acetone, in *Standard solution B* and *Standard solution D*, respectively

*X* = ratio of the alcohol peak areas, or the acetone peak areas, to the internal standard peak areas for *Standard solution A* and *Standard solution C*, respectively

### Acceptance criteria

**Alcohol ( $C_2H_5OH$ ):** 62.0%–68.0%

**Acetone ( $C_3H_6O$ ):** 9.0%–11.0%

### SPECIFIC TESTS

• **SPECIFIC GRAVITY** <841>: 0.868–0.876

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers.

## Benzocaine

$C_9H_{11}NO_2$  165.19

Benzoic acid, 4-amino-, ethyl ester.

Ethyl *p*-aminobenzoate [94-09-7].

» Benzocaine, dried over phosphorus pentoxide for 3 hours, contains not less than 98.0 percent and not more than 102.0 percent of  $C_9H_{11}NO_2$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Benzocaine RS

**Identification**—

**A:** *Infrared Absorption* (197K): previously dried over phosphorus pentoxide for 3 hours.

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 5 µg per mL.

*Medium:* chloroform.

Absorptivities at 278 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** Dissolve about 20 mg in 10 mL of water with the aid of a few drops of 3 N hydrochloric acid, and add 5 drops of a solution of sodium nitrite (1 in 10), followed by 2 mL of a solution of 100 mg of 2-naphthol in 5 mL of 1 N sodium hydroxide: an orange-red precipitate is formed.

**Melting range**, *Class I* (741): between 88° and 92°, but the range between beginning and end of melting does not exceed 2°.

**Reaction**—Dissolve 1.0 g in 10 mL of neutralized alcohol: a clear solution results. Dilute this solution with 10 mL of water, and add 2 drops of phenolphthalein TS and 1 drop of 0.10 N sodium hydroxide: a red color is produced.

**Loss on drying** (731)—Dry it over phosphorus pentoxide for 3 hours: it loses not more than 1.0% of its weight.

**Readily carbonizable substances** (271)—Dissolve 500 mg in 5 mL of sulfuric acid: the solution has no more color than *Matching Fluid A*.

**Residue on ignition** (281): not more than 0.1%.

**Chloride**—To a solution of 200 mg in 5 mL of alcohol, previously acidified with a few drops of diluted nitric acid, add a few drops of silver nitrate TS: no turbidity is produced immediately.

**Heavy metals**, *Method II* (231): 0.001%.

**Ordinary impurities** (466)—

*Test solution:* dehydrated alcohol.

*Standard solution:* dehydrated alcohol.

*Application volume:* 10 µL.

*Eluant:* chloroform containing about 0.75% of dehydrated alcohol as a preservative, in a nonequilibrated chamber.

*Visualization:* 1.

*Limit*—The total of any ordinary impurities observed does not exceed 1%.

**Assay**—

*Aqueous solution*—To 980 mL of water, add 20 mL of acetic acid and 1 mL of triethylamine, and mix well. The pH should be between 2.95 and 3.0; adjust as needed.

*Mobile phase*—Prepare a filtered and degassed mixture of *Aqueous solution* and methanol (60:40).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Benzocaine RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.024 mg per mL.

*Assay preparation*—Transfer about 24 mg of Benzocaine, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Dilute 10 mL of this solution with *Mobile phase* to 100 mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 285-nm detector and a 2.0-mm × 15-cm column that contains 5-µm packing L11. The flow rate is about 0.2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor of the benzocaine peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the benzocaine peaks. Calculate the quantity, in mg, of  $C_9H_{11}NO_2$  in the portion of Benzocaine taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Benzocaine RS in the *Standard preparation*;  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and *Standard preparation*, respectively; and 1000 is the dilution factor for the *Assay preparation*.

## Benzocaine Topical Aerosol

### DEFINITION

Benzocaine Topical Aerosol is a solution of Benzocaine in a pressurized container. It contains NLT 90.0% and NMT 110.0% of the labeled amount of benzocaine ( $C_9H_{11}NO_2$ ).

### IDENTIFICATION

#### • A.

**Sample:** An amount of Topical Aerosol, equivalent to 5 mg of benzocaine

**Analysis:** Spray the *Sample* into a beaker, and heat on a steam bath for a few min to expel residual propellant. Add 20 mL of 0.5 N hydrochloric acid, warm gently to disperse, cool, and filter. To 10 mL of the filtrate add 5 drops of sodium nitrite solution (1 in 10) and 2 drops of methyl red TS, and neutralize with 1 N sodium hydroxide. Add 2 mL of a solution of 100 mg of 2-naphthol in 5 mL of 1 N sodium hydroxide.

**Acceptance criteria:** An orange-red precipitate is formed.

### ASSAY

#### • PROCEDURE

**Sample solution:** Spray a portion of the Topical Aerosol into a beaker, and heat on a steam bath for a few min to expel residual propellant. Cool, and transfer a portion of the solution, equivalent to 200 mg of benzocaine, to a 250-mL beaker. Add 50 mL of water and 5 mL of hydrochloric acid, and stir. Cool the solution in an ice bath to 10°.

**Analysis:** Titrate slowly with 0.1 M sodium nitrite VS potentiometrically, using a calomel–platinum electrode system. Perform a blank determination, and make any necessary correction (see *Titrimetry* <541>). Each mL of 0.1 M sodium nitrite is equivalent to 16.52 mg of benzocaine ( $C_9H_{11}NO_2$ ).

**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

- **OTHER REQUIREMENTS:** It meets the requirements in *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* <601>, *Pressure Test*, *Minimum Fill*, and *Leakage Test*.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in pressurized containers, and avoid exposure to excessive heat.

### Benzocaine Cream

» Benzocaine Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_9H_{11}NO_2$  in a suitable cream base.

**Packaging and storage—**Preserve in tight containers, protected from light, and avoid prolonged exposure to temperatures exceeding 30°.

**Identification—**Place an amount of Cream, equivalent to about 50 mg of benzocaine, in a small beaker, add 20 mL of 0.5 N hydrochloric acid, warm gently to disperse the Cream, cool, and filter. To 10 mL of the filtrate add 5 drops of a solution of sodium nitrite (1 in 10) and 2 drops of methyl red TS, and neutralize with 1 N sodium hydroxide. Add 2 mL of a solution of 100 mg of 2-naphthol in 5 mL of 1 N sodium hydroxide: an orange-red precipitate is formed.

**Microbial enumeration tests <61> and Tests for specified microorganisms <62>—**It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill <755>:** meets the requirements.

**Assay—**Weigh accurately an amount of Cream, equivalent to about 200 mg of benzocaine, in a tared 250-mL beaker. Add 50 mL of water and 5 mL of hydrochloric acid, and stir by mechanical means, with gentle warming, until solution is effected. Cool the solution in an ice bath to about 10°, and titrate slowly with 0.1 M sodium nitrite VS, determining the endpoint potentiometrically using a calomel–platinum electrode system. Each mL of 0.1 M sodium nitrite is equivalent to 16.52 mg of  $C_9H_{11}NO_2$ .

### Benzocaine Gel

» Benzocaine Gel contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_9H_{11}NO_2$ .

**Packaging and storage—**Preserve in well-closed containers.

**USP Reference standards <11>—**  
USP Benzocaine RS

#### Identification—

**A:** Transfer an amount of Gel, equivalent to about 5 mg of benzocaine, to a beaker, add 20 mL of 0.5 N hydrochloric acid, warm gently to disperse the Gel, cool, and filter, if

necessary, to obtain a clear solution. To 10 mL of the clear solution add 5 drops of a solution of sodium nitrite (1 in 10) and 2 drops of methyl red TS, and neutralize with 1 N sodium hydroxide. Add 2 mL of a solution of 100 mg of 2-naphthol in 5 mL of 1 N sodium hydroxide: an orange-red precipitate is formed.

**B:** The retention time of the major peak of benzocaine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Microbial enumeration tests <61> and Tests for specified microorganisms <62>—**It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill <755>:** meets the requirements.

#### Assay—

**Diluent—**Prepare a mixture of methanol and water (1:1).

**Mobile phase—**Prepare a mixture of methanol, water, and glacial acetic acid (56:40:4). Make adjustments if necessary see *System Suitability* under *Chromatography* <621>).

**Standard preparation—**Prepare a solution of USP Benzocaine RS in *Diluent* having a known concentration of about 0.02 mg per mL.

**Assay preparation—**Transfer an accurately weighed portion of Gel, equivalent to about 200 mg of benzocaine, to a 100-mL volumetric flask, add 80 mL of *Diluent*, and shake by mechanical means for 15 minutes. Dilute with *Diluent* to volume, mix, and filter, if necessary, to obtain a clear solution, discarding the first 5 mL of the filtrate. Transfer 1.0 mL of the clear solution to a second 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 294-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure—**[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 50 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_9H_{11}NO_2$  in the portion of Gel taken by the formula:

$$10,000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Benzocaine RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the benzocaine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Benzocaine Lozenges

» Benzocaine Lozenges contain not less than 85.0 percent and not more than 120.0 percent of the labeled amount of  $C_9H_{11}NO_2$ .

**Packaging and storage—**Preserve in well-closed containers.

**USP Reference standards <11>—**  
USP Benzocaine RS

#### Identification—

**A:** Dissolve a quantity of powdered Lozenges, equivalent to about 20 mg of benzocaine, in 10 mL of water with the aid of a few drops of 3 N hydrochloric acid, and filter, if necessary, to obtain a clear solution. Add 5 drops of a solu-

tion of sodium nitrite (1 in 10), followed by 2 mL of a solution of 100 mg of 2-naphthol in 5 mL of 1 N sodium hydroxide: an orange-red precipitate is formed.

**B:** The retention time of the major peak for benzocaine in the chromatograms of the *Assay preparations* corresponds to that in the chromatograms of the respective *Standard preparations*, as obtained in the *Assay*.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of water, acetonitrile, and 1.0 M monobasic potassium phosphate solution previously adjusted with phosphoric acid to a pH of 3.0 (700:250:50). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation 1**—Prepare a solution of USP Benzocaine RS in 0.1 N hydrochloric acid having a known concentration of about 0.01 mg per mL.

**Standard preparation 2**—Prepare a solution of USP Benzocaine RS in a mixture of acetonitrile and water (1:1) having a known concentration of about 0.01 mg per mL.

**Assay preparations**—Weigh and finely powder not fewer than 20 Lozenges. Transfer accurately weighed portions of the powder, each equivalent to about 40 mg of benzocaine, to two separate 200-mL volumetric flasks. To one flask add about 150 mL of 0.1 N hydrochloric acid, and stir for not less than 2 hours. Dilute with 0.1 N hydrochloric acid to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix (*Assay preparation 1*). To the second flask add about 150 mL of a mixture of acetonitrile and water (1:1), and stir for not less than 30 minutes. Dilute with the mixture of acetonitrile and water (1:1) to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with the mixture of acetonitrile and water (1:1) to volume, and mix (*Assay preparation 2*).

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparations*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of *Assay preparation 1*, *Assay preparation 2*, *Standard preparation 1*, and *Standard preparation 2* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of total C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub> in the portion of Lozenges taken to prepare *Assay preparation 1* by the formula:

$$200C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Benzocaine RS in *Standard preparation 1*, and  $r_u$  and  $r_s$  are the benzocaine peak areas obtained from *Assay preparation 1* and *Standard preparation 1*, respectively. Calculate the quantity, in mg, of free C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub> in the portion of Lozenges taken to prepare *Assay preparation 2* by the formula:

$$200C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Benzocaine RS in *Standard preparation 2*, and  $r_u$  and  $r_s$  are the benzocaine peak responses obtained from *Assay preparation 2* and *Standard preparation 2*, respectively.

## Benzocaine Ointment

» Benzocaine Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub> in a suitable ointment base.

**Packaging and storage**—Preserve in tight containers, protected from light, and avoid prolonged exposure to temperatures exceeding 30°.

#### Identification—

**Ointments having water-soluble bases**—Transfer an amount of Ointment, equivalent to about 5 mg of benzocaine, to a small beaker, add 20 mL of 0.5 N hydrochloric acid, warm gently to disperse the Ointment, cool, and filter, if necessary. To 10 mL of the filtrate add 5 drops of a solution of sodium nitrite (1 in 10) and 2 drops of methyl red TS, and neutralize with 1 N sodium hydroxide. Add 2 mL of a solution of 100 mg of 2-naphthol in 5 mL of sodium hydroxide TS: an orange-red precipitate is formed.

**Ointments having water-insoluble bases**—Transfer an amount of Ointment, equivalent to about 2.5 mg of benzocaine, to a small separator, and dissolve in 20 mL of ether. Extract with 10 mL of 0.5 N hydrochloric acid, and filter the aqueous phase through paper into a small beaker. Add 5 drops of a solution of sodium nitrite (1 in 10) and 2 drops of methyl red TS, and neutralize with 1 N sodium hydroxide. Add 2 mL of a solution of 100 mg of 2-naphthol in 5 mL of 1 N sodium hydroxide: an orange-red precipitate is formed.

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill (755):** meets the requirements.

#### Assay—

**Ointments having water-soluble bases**—Accurately weigh an amount of Ointment, equivalent to about 200 mg of benzocaine, in a tared 250-mL beaker. Add 50 mL of water and 5 mL of hydrochloric acid, and stir by mechanical means until solution is effected. Cool the solution in an ice bath to about 10°, and titrate slowly with 0.1 M sodium nitrite VS, determining the endpoint potentiometrically using a calomel-platinum electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M sodium nitrite is equivalent to 16.52 mg of C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>.

**Ointments having water-insoluble bases**—Accurately weigh an amount of Ointment, equivalent to about 200 mg of benzocaine, and transfer to a 125-mL separator. Suspend the Ointment in 50 mL of ether by shaking, and extract with three successive 25-mL portions of 1 N hydrochloric acid, filtering each portion into a 250-mL beaker, and proceed as directed under *Ointments having water-soluble bases*, beginning with "Cool the solution."

## Benzocaine Otic Solution

» Benzocaine Otic Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Identification**—Transfer a volume of Otic Solution, equivalent to about 2.5 mg of benzocaine, to a small beaker, add

10 mL of water, and dissolve with the aid of a few drops of 3 N hydrochloric acid. Add 5 drops of sodium nitrite solution (1 in 10), then add 2 mL of a solution of 100 mg of 2-naphthol in 5 mL of 1 N sodium hydroxide: an orange-red precipitate is formed.

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli* and for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*; the total aerobic microbial count is less than 100 cfu per mL.

**Assay**—Transfer an accurately measured volume of Otic Solution, equivalent to about 400 mg of benzocaine, to a beaker, add 150 mL of cold 1.6 N hydrochloric acid, and stir until a fine dispersion is obtained. Cool the solution in an ice bath to about 10°, and titrate slowly with 0.1 M sodium nitrite VS, determining the endpoint potentiometrically, using a calomel-platinum electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M sodium nitrite is equivalent to 16.52 mg of  $C_9H_{11}NO_2$ .

## Benzocaine Topical Solution

» Benzocaine Topical Solution is a solution of Benzocaine in a suitable solvent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_9H_{11}NO_2$ . It contains a suitable antimicrobial agent.

**Packaging and storage**—Preserve in tight containers, protected from light, and avoid prolonged exposure to temperatures exceeding 30°.

**Identification**—Transfer an amount of Topical Solution, equivalent to about 5 mg of benzocaine, to a small beaker, add 20 mL of 0.5 N hydrochloric acid, warm gently to disperse, cool, and filter. To 10 mL of the filtrate add 5 drops of sodium nitrite solution (1 in 10) and 2 drops of methyl red TS, and neutralize with 1 N sodium hydroxide. Add 2 mL of a solution of 100 mg of 2-naphthol in 5 mL of 1 N sodium hydroxide: an orange-red precipitate is formed.

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Assay**—Transfer an accurately weighed portion of Topical Solution, equivalent to about 200 mg of benzocaine, to a 250-mL beaker. Add 50 mL of water and 5 mL of hydrochloric acid, and stir. Cool the solution in an ice bath to about 10°, and titrate slowly with 0.1 M sodium nitrite VS, determining the endpoint potentiometrically, using a calomel-platinum electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M sodium nitrite is equivalent to 16.52 mg of  $C_9H_{11}NO_2$ .

## Benzocaine, Butamben, and Tetracaine Hydrochloride Topical Aerosol

### DEFINITION

Benzocaine, Butamben, and Tetracaine Hydrochloride Topical Aerosol is Benzocaine, Butamben, and Tetracaine Hydrochloride Topical Solution packaged in a pressurized container with a suitable inert propellant. It contains NLT 90.0% and NMT 110.0% of the labeled amounts of ben-

zocaine ( $C_9H_{11}NO_2$ ), butamben ( $C_{11}H_{15}NO_2$ ), and tetracaine hydrochloride ( $C_{15}H_{24}N_2O_2 \cdot HCl$ ).

### IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Diluent:** Methanol and water (60:40)

**Mobile phase:** Methanol, water, and 0.25 M sodium 1-heptanesulfonate (500:500:20)

**Standard solution:** Transfer 140 mg of USP Benzocaine RS to a 100-mL volumetric flask. Swirl with the aid of 25 mL of methanol, and transfer 140/ mg of USP Butamben RS to the same volumetric flask with the aid of 25 mL of water, *f* being the ratio of the labeled amount, as a percentage, of butamben to the labeled amount, as a percentage, of benzocaine in the Topical Aerosol. Transfer 140/*f* mg of USP Tetracaine Hydrochloride RS into the same volumetric flask with the aid of 25 mL of water, *f'* being the ratio of the labeled amount, as a percentage, of tetracaine hydrochloride to the labeled amount, as a percentage, of benzocaine in the Topical Aerosol. Sonicate for 1 min, and dilute with *Diluent* to volume.

**Sample stock solution:** Fit the valve of the Topical Aerosol container with a cannula, and expel the contents of the container into a 100-mL, glass-stoppered, round-bottom flask. Attach the flask to a rotary evaporator, and evaporate under a vacuum of 600 mm of mercury for 2.5 h. Transfer a portion of the material in the round-bottom flask, equivalent to 1400 mg of benzocaine, to a 100-mL volumetric flask. Add 75 mL of methanol, and mix. Sonicate for 1 min, dilute with methanol to volume, and mix.

**Sample solution:** Transfer 10.0 mL of the *Sample stock solution* to a 100-mL volumetric flask. Add 75 mL of *Diluent*. Shake, and dilute with *Diluent* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 313 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 10 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for benzocaine, butamben, and tetracaine are 0.3, 0.8, and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2 between the benzocaine and butamben peaks; NLT 2 between the butamben and tetracaine peaks

**Relative standard deviation:** NMT 2.0% for each of the three analyte peaks

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the individual percentage of the labeled amount of benzocaine ( $C_9H_{11}NO_2$ ), butamben ( $C_{11}H_{15}NO_2$ ), and tetracaine hydrochloride ( $C_{15}H_{24}N_2O_2 \cdot HCl$ ) in the portion of Topical Aerosol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the corresponding analyte from the *Sample solution*

$r_S$  = peak response of the corresponding analyte from the *Standard solution*

$C_S$  = concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the corresponding analyte in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of benzocaine, butamben, and tetracaine hydrochloride

#### SPECIFIC TESTS

- **OTHER REQUIREMENTS:** It meets the requirements in *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* (601), *Pressure Test, Minimum Fill, and Leakage Test*.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in pressurized containers, and avoid exposure to excessive heat.
- **USP REFERENCE STANDARDS** (11)
  - USP Benzocaine RS
  - USP Butamben RS
  - USP Tetracaine Hydrochloride RS

### Benzocaine, Butamben, and Tetracaine Hydrochloride Gel

» Benzocaine, Butamben, and Tetracaine Hydrochloride Gel is Benzocaine, Butamben, and Tetracaine Hydrochloride in a suitable gel base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of benzocaine ( $C_9H_{11}NO_2$ ), butamben ( $C_{11}H_{15}NO_2$ ), and tetracaine hydrochloride ( $C_{15}H_{24}N_2O_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers, and avoid freezing.

#### USP Reference standards (11)—

USP Benzocaine RS  
USP Butamben RS  
USP Tetracaine Hydrochloride RS

**Identification**—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Minimum fill** (755): meets the requirements.

#### Assay—

*Diluent, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Benzocaine, Butamben, and Tetracaine Hydrochloride Topical Solution*.

*Assay preparation*—Transfer an accurately weighed portion of Gel, equivalent to about 1400 mg of benzocaine, to a 100-mL volumetric flask. Add about 75 mL of methanol, and mix. Sonicate for about 1 minute, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, add about 75 mL of *Diluent*, shake, dilute with *Diluent* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Benzocaine, Butamben, and Tetracaine Hydrochloride Topical Solution*. Calculate the individual quantities, in mg, of benzocaine ( $C_9H_{11}NO_2$ ), butamben ( $C_{11}H_{15}NO_2$ ), and tetracaine hydrochloride ( $C_{15}H_{24}N_2O_2 \cdot HCl$ ) in the portion of Gel taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of the appropriate Reference Standard in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Benzocaine, Butamben, and Tetracaine Hydrochloride Ointment

» Benzocaine, Butamben, and Tetracaine Hydrochloride Ointment is Benzocaine, Butamben, and Tetracaine Hydrochloride in a suitable ointment base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of benzocaine ( $C_9H_{11}NO_2$ ), butamben ( $C_{11}H_{15}NO_2$ ), and tetracaine hydrochloride ( $C_{15}H_{24}N_2O_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers, and avoid freezing.

#### USP Reference standards (11)—

USP Benzocaine RS  
USP Butamben RS  
USP Tetracaine Hydrochloride RS

**Identification**—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Minimum fill** (755): meets the requirements.

#### Assay—

*Diluent, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Benzocaine, Butamben, and Tetracaine Hydrochloride Topical Solution*.

*Assay preparation*—Transfer an accurately weighed portion of Ointment, equivalent to about 1400 mg of benzocaine, to a 100-mL volumetric flask. Add about 75 mL of methanol, and mix. Sonicate for about 1 minute, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, add about 75 mL of *Diluent*, shake, dilute with *Diluent* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Benzocaine, Butamben, and Tetracaine Hydrochloride Topical Solution*. Calculate the individual quantities, in mg, of benzocaine ( $C_9H_{11}NO_2$ ), butamben ( $C_{11}H_{15}NO_2$ ), and tetracaine hydrochloride ( $C_{15}H_{24}N_2O_2 \cdot HCl$ ) in the portion of Ointment taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of the appropriate Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Benzocaine, Butamben, and Tetracaine Hydrochloride Topical Solution

» Benzocaine, Butamben, and Tetracaine Hydrochloride Topical Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of benzocaine ( $C_9H_{11}NO_2$ ), butamben ( $C_{11}H_{15}NO_2$ ), and tetracaine hydrochloride ( $C_{15}H_{24}N_2O_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers, and avoid freezing.

**USP Reference standards** (11)—

USP Benzocaine RS

USP Butamben RS

USP Tetracaine Hydrochloride RS

**Identification**—The retention times of the major peaks in the chromatograms of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Minimum fill** (755): meets the requirements.

**Assay**—

*Diluent*—Prepare a mixture of methanol and water (60:40).

*Mobile phase*—Prepare a mixture of methanol, water, and 0.25 M sodium 1-heptanesulfonate (500:500:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Transfer about 140 mg of USP Benzocaine RS, accurately weighed, to a 100-mL volumetric flask with the aid of 25 mL of methanol, and swirl. Transfer about 140 *J* mg of USP Butamben RS, accurately weighed, to the same volumetric flask with the aid of 25 mL of water, *J* being the ratio of the labeled amount, in percent, of butamben to the labeled amount, in percent, of benzocaine in the Topical Solution. Transfer about 140 *J'* mg of USP Tetracaine Hydrochloride RS, accurately weighed, to the same volumetric flask with the aid of 25 mL of water, *J'* being the ratio of the labeled amount, in percent, of tetracaine hydrochloride to the labeled amount, in percent, of benzocaine in the Topical Solution. Sonicate for about 1 minute, dilute with *Diluent* to volume, and mix.

*Assay preparation*—Transfer an accurately measured volume of Topical Solution, equivalent to about 1400 mg of benzocaine, to a 100-mL volumetric flask. Add about 75 mL of methanol, and mix. Sonicate for about 1 minute, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, add about 75 mL of *Diluent*, shake, dilute with *Diluent* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 313-nm detector, and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.3 for benzocaine, 0.8 for butamben, and 1.0 for tetracaine; the resolution, *R*, between the benzocaine peak and the butamben peak and between the butamben peak and the tetracaine peak is not less than 2; and the relative standard deviation for replicate injections is not more than 2.0% for each of the three analyte peaks.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for the major peaks. Calculate the individual quantities, in mg, of benzocaine (C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>), butamben (C<sub>11</sub>H<sub>15</sub>NO<sub>2</sub>), and tetracaine hydrochloride (C<sub>15</sub>H<sub>24</sub>N<sub>2</sub>O<sub>2</sub> · HCl) in the portion of Topical Solution taken by the formula:

$$1000C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of the appropriate Reference Standard in the *Standard preparation*, and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak areas in the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Benzocaine and Menthol Topical Aerosol

**DEFINITION**

Benzocaine and Menthol Topical Aerosol is a solution of Benzocaine and Menthol with suitable propellants in a pressurized container. It contains NLT 90.0% and NMT 110.0% of the labeled amounts of benzocaine (C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>) and menthol (C<sub>10</sub>H<sub>20</sub>O).

**IDENTIFICATION**• **A.**

**Sample:** An amount of Topical Aerosol equivalent to 5 mg of benzocaine

**Analysis:** Transfer the *Sample* to a beaker. Add 20 mL of 0.5 N hydrochloric acid, and warm gently to disperse the solution. Cool, and filter if necessary, to obtain a clear solution. To 10 mL of the clear solution add 5 drops of a solution of sodium nitrite (1 in 10) and 2 drops of methyl red TS, and neutralize with 1 N sodium hydroxide. Add 2 mL of a solution of 100 mg of 2-naphthol in 5 mL of 1 N sodium hydroxide.

**Acceptance criteria:** An orange-red precipitate is formed.

- **B.** The retention time of the major peak for benzocaine of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C.** The retention time of the major peak for menthol of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **BENZOCAINE**

**Mobile phase:** Methanol, water, and glacial acetic acid (56:40:4)

**Diluent:** Methanol and water (1:1)

**Standard solution:** 0.02 mg/mL of USP Benzocaine RS in *Diluent*

**Sample solution:** Nominally 0.02 mg/mL of benzocaine in *Diluent* prepared as follows. Spray the contents of the Topical Aerosol into a flask. Transfer an amount of Topical Aerosol containing 200 mg of benzocaine to a suitable volumetric flask, and dilute with *Diluent*.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 294 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 50 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of benzocaine (C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>) in the portion of Topical Aerosol taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

*r<sub>U</sub>* = peak response from the *Sample solution*

*r<sub>S</sub>* = peak response from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Benzocaine RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = nominal concentration in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

• **MENTHOL**

**Internal standard solution:** 1 mg/mL of decanol in *n*-hexane

**Standard stock solution:** 1 mg/mL of USP Menthol RS in *n*-hexane

**Standard solution:** 0.05 mg/mL each of USP Menthol RS and decanol in ether from *Standard stock solution* and *Internal standard solution*

**Sample stock solution:** Spray the contents of the Topical Aerosol into a flask. Transfer an amount of Topical Aerosol equivalent to 50 mg of menthol to a separator, and extract with three 15-mL portions of ether, collecting the ether extracts in a 50-mL volumetric flask. Dilute with ether to volume.

**Sample solution:** Nominally 0.05 mg/mL of menthol prepared as follows. Transfer 5.0 mL of the *Sample stock solution* to a 100-mL volumetric flask, add 5.0 mL of *n*-hexane and 5.0 mL of *Internal standard solution*, and dilute with ether to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 2-mm × 1.8-m; packed with 10% phase G16 on support S1AB

**Carrier gas:** Helium

**Temperatures**

**Column:** 170°

**Injection port:** 260°

**Detector:** 240°

**Flow rate:** 50 mL/min

**Injection volume:** 2 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for menthol and decanol are 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.5 between the menthol and decanol peaks

**Relative standard deviation:** NMT 2% of the ratio of the peak response of menthol to that of decanol

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of menthol (C<sub>10</sub>H<sub>20</sub>O) in the portion of Topical Aerosol taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of menthol to decanol from the *Sample solution*

$R_S$  = peak response ratio of menthol to decanol from the *Standard solution*

$C_S$  = concentration of USP Menthol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of menthol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

- **MINIMUM FILL** <755>: Meets the requirements

#### SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: It meets the requirements for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.
- **OTHER REQUIREMENTS:** It meets the requirements in *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* <601>, *Pressure Test*, and *Leakage Test*.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, pressurized containers, and avoid exposure to excessive heat.
- **USP REFERENCE STANDARDS** <11>  
USP Benzocaine RS  
USP Menthol RS

## Benzoic Acid

C<sub>7</sub>H<sub>6</sub>O<sub>2</sub>

122.12

Benzoic acid [65-85-0].

#### DEFINITION

Benzoic Acid contains NLT 99.5% and NMT 100.5% of benzoic acid (C<sub>7</sub>H<sub>6</sub>O<sub>2</sub>), calculated on the anhydrous basis.

#### IDENTIFICATION

##### • A.

**Sample solution:** Prepare a saturated solution of Benzoic Acid in water, and filter twice.

**Analysis 1:** To one portion of the filtrate add ferric chloride TS.

**Acceptance criteria 1:** A salmon-colored precipitate is formed.

**Analysis 2:** To a separate 10-mL portion of the filtrate add 1 mL of 7 N sulfuric acid, and cool the mixture.

**Acceptance criteria 2:** A white precipitate forms in 10 min. This precipitate is soluble in ether.

#### ASSAY

##### • PROCEDURE

**Sample:** 500 mg of Benzoic Acid

**Analysis:** Dissolve the *Sample* in 25 mL of diluted alcohol that previously has been neutralized with 0.1 N sodium hydroxide. Add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS to a pink color. Each mL of 0.1 N sodium hydroxide is equivalent to 12.21 mg of benzoic acid (C<sub>7</sub>H<sub>6</sub>O<sub>2</sub>).

**Acceptance criteria:** 99.5%–100.5% on the anhydrous basis

#### IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.05%

- **HEAVY METALS** <231>

**Test preparation:** Dissolve 2.0 g in 25 mL of acetone, and add 2 mL of water.

**Analysis:** Add 1.2 mL of thioacetamide–glycerin base TS and 2 mL of pH 3.5 *Acetate Buffer*, and allow to stand for 5 min.

**Acceptance criteria:** NMT 10 µg/g; any color produced is not darker than that of a control made with 25 mL of acetone and 2.0 mL of *Standard Lead Solution* and treated in the same manner.

#### SPECIFIC TESTS

- **CONGEALING TEMPERATURE** <651>: 121°–123°

- **WATER DETERMINATION, Method I** <921>

**Sample solution:** A 1-in-2 solution of methanol in pyridine is used as the solvent.

**Acceptance criteria:** NMT 0.7%

- **READILY CARBONIZABLE SUBSTANCES TEST** <271>

**Sample solution:** 500 mg in 5 mL of sulfuric acid

**Acceptance criteria:** The solution has no more color than *Matching Fluid Q*.

- **READILY OXIDIZABLE SUBSTANCES**

**Sample solution:** Add 1.5 mL of sulfuric acid to 100 mL of water. Heat to boiling, and add 0.1 N potassium permanganate, dropwise, until the pink color persists for 30 s. Dissolve 1.00 g of Benzoic Acid in the hot solution.

**Analysis:** Titrate with 0.1 N potassium permanganate VS to a pink color that persists for 15 s.

**Acceptance criteria:** NMT 0.50 mL of 0.10 N potassium permanganate is consumed.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

**Benzoic and Salicylic Acids Ointment****DEFINITION**

Benzoic and Salicylic Acids Ointment is Benzoic Acid and Salicylic Acid, present in a ratio of 2:1, in a suitable ointment base. It contains NLT 90.0% and NMT 110.0% of the labeled amounts of benzoic acid ( $C_7H_6O_2$ ) and salicylic acid ( $C_7H_6O_3$ ).

**IDENTIFICATION**

- **A. THIN-LAYER CHROMATOGRAPHY**

**Diluent:** Mixture of chloroform and methanol (1:1)

**Standard solution A:** 2.4 mg/mL of USP Benzoic Acid RS in *Diluent*

**Standard solution B:** 1.2 mg/mL of USP Salicylic Acid RS in *Diluent*

**Sample solution:** Equivalent to 60 mg of benzoic acid and 30 mg of salicylic acid from Ointment, in 25 mL of *Diluent*

**Chromatographic system**

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 5  $\mu$ L of each solution at separate points 2.5 cm from the bottom edge of a 20-  $\times$  20-cm thin-layer chromatographic plate

**Developing solvent system:** Chloroform, acetone, isopropyl alcohol, methanol, and ammonium hydroxide (30:30:15:15:10)

**Analysis**

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chromatographic chamber, mark the solvent front, and allow the solvent to evaporate. View the chromatogram under short-wavelength (254 nm) UV radiation.

**Acceptance criteria:** The two major fluorescent spots from the *Sample solution* correspond in color and in  $R_f$  value to those from *Standard solution A* and *Standard solution B*.

**ASSAY**

- **PROCEDURE**

**Ferric chloride-urea reagent:** On the day of use, dissolve, without heating, 18 g of urea in a mixture of 2.5 mL of ferric chloride solution (6 in 10) and 12.5 mL of 0.05 N hydrochloric acid.

**Column A:** Insert a small pledget of glass wool above the stem constriction of a 20-  $\times$  2.5-cm chromatographic tube. Mix 1 g of chromatographic siliceous earth with 0.5 mL of dilute phosphoric acid (3 in 10) to form a uniform, fluffy mixture; transfer to the chromatographic tube; and pack evenly over the glass wool, exerting gentle pressure. Similarly, mix 4 g of chromatographic siliceous earth with 3 mL of *Ferric chloride-urea reagent*, and pack uniformly over the first layer. Cover the column with a pad of glass wool.

**Column B:** Insert a small pledget of glass wool above the stem constriction of a second 20-  $\times$  2.5-cm chromatographic tube. Mix 4 g of chromatographic siliceous earth with 2 mL of sodium bicarbonate solution (1 in 12), prepared just before use, to a uniform, fluffy mixture; and pack evenly over the glass wool. Cover the column with a pad of glass wool.

**Diluent:** Glacial acetic acid in chloroform (3 in 100)

**Standard solution A:** 20  $\mu$ g/mL of USP Salicylic Acid RS in *Diluent*

**Standard solution B:** 40  $\mu$ g/mL of USP Benzoic Acid RS in *Diluent*

**Sample solution:** Transfer an amount of the Ointment, equivalent to 100 mg of benzoic acid and 50 mg of salicylic acid, to a 250-mL volumetric flask, and dissolve in 150 mL of chloroform by warming on a steam bath. Cool. Dilute with chloroform to volume to obtain a solution having a nominal concentration of 200  $\mu$ g/mL of salicylic acid and 400  $\mu$ g/mL of benzoic acid.

**Analysis**

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Mount *Column A* directly over *Column B*, then pipet 10 mL of *Sample solution* onto *Column A*, and allow it to pass into the column. Wash the columns with two 40-mL portions of chloroform, allowing the first portion to recede to the top of each column before adding the second portion. Discard the eluates, and separate the columns.

**Salicylic acid content:** Elute *Column A* with 95 mL of *Diluent*, collecting the eluate in a 100-mL volumetric flask. Dilute the contents of the flask with *Diluent* to volume, and mix. Concomitantly determine the absorbances of the eluate and *Standard solution A* in 1-cm cells at the wavelength of maximum absorbance at 311 nm, with a suitable spectrophotometer, using *Diluent* as the blank.

Calculate the percentage of the labeled amount of salicylic acid ( $C_7H_6O_3$ ) in the portion of Ointment taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times F \times 100$$

$A_U$  = absorbance of the diluted eluate from *Column A*

$A_S$  = absorbance of *Standard solution A*

$C_S$  = concentration of USP Salicylic Acid RS in *Standard solution A* ( $\mu$ g/mL)

$C_U$  = nominal concentration of the salicylic acid in the *Sample solution* ( $\mu$ g/mL)

$F$  = sample dilution factor, 10

**Acceptance criteria:** 90.0%–110.0%

**Benzoic acid content:** Elute *Column B* with 95 mL of *Diluent*, collecting the eluate in a 100-mL volumetric flask. Dilute the contents of the flask with *Diluent* to volume, and mix. Concomitantly determine the absorbances of eluate and *Standard solution B* in 1-cm cells at the wavelength of maximum absorbance at 275 nm, with a suitable spectrophotometer, using *Diluent* as the blank.

Calculate the percentage of the labeled amount of benzoic acid ( $C_7H_6O_2$ ) in the portion of Ointment taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times F \times 100$$

$A_U$  = absorbance of the diluted eluate from *Column B*

$A_S$  = absorbance of *Standard solution B*

$C_S$  = concentration of USP Benzoic Acid RS in *Standard solution B* ( $\mu$ g/mL)

$C_U$  = nominal concentration of benzoic acid in the *Sample solution* ( $\mu$ g/mL)

$F$  = sample dilution factor, 10

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **MINIMUM FILL <755>:** Meets the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and avoid exposure to temperatures exceeding 30°.
- **LABELING:** Label Ointment to indicate the concentrations of Benzoic Acid and Salicylic Acid and to indicate

whether the ointment base is water-soluble or water-insoluble.

- **USP REFERENCE STANDARDS** <11>  
USP Benzoic Acid RS  
USP Salicylic Acid RS

## Benzoïn

### DEFINITION

Benzoïn is the balsamic resin obtained from *Styrax benzoïn* Dryander or *Styrax paralleloneurus* Perkins, known in commerce as Sumatra Benzoïn, or from *Styrax tonkinensis* (Pi  re) Craib ex Hartwich, or other species of the Section *Anthostyrax* of the genus *Styrax*, known in commerce as Siam Benzoïn (Fam. *Styraceae*).

Sumatra Benzoïn yields NLT 75.0% of alcohol-soluble extractive, and Siam Benzoïn yields NLT 90.0% of alcohol-soluble extractive.

### IDENTIFICATION

- **A.** A solution in alcohol becomes milky upon the addition of water, and the mixture is acid to litmus paper.
- **B. IDENTIFICATION OF ARTICLES OF BOTANICAL ORIGIN** <563>  
**Analysis:** Heat a few fragments in a test tube.  
**Acceptance criteria:** Sumatra Benzoïn evolves a sublimate consisting of plates and small, rod-like crystals of cinnamic acid and its esters that strongly polarize light. Siam Benzoïn evolves a sublimate directly above the melted mass, consisting of numerous long, rod-shaped crystals of benzoic acid that do not strongly polarize light.

### ASSAY

#### • PROCEDURE

**Sample:** Place 2 g of Benzoïn in a tared extraction thimble, and insert the thimble in a continuous-extraction apparatus. Place 100 mg of sodium hydroxide in the receiving flask of the apparatus, and extract the Benzoïn with alcohol for 5 h, or until completely extracted. Dry the extraction thimble containing the insoluble residue at 105   for 2 h.

**Analysis:** On a separate portion of Benzoïn, determine the water content as directed for *Water Determination* <921>, *Method II*. Calculate the weight of water in the quantity of the Benzoïn taken for the Assay, and subtract it from the original weight of the Benzoïn taken. The difference between this result and the weight of the residue in the extraction thimble represents the alcohol-soluble extractive.

**Acceptance criteria:** The alcohol-soluble extractive is NLT 75.0% for Sumatra Benzoïn and NLT 90.0% for Siam Benzoïn.

### OTHER COMPONENTS

#### • CONTENT OF BENZOIC ACID

**Analysis:** Treat 1 g of powdered Benzoïn with 15 mL of warm carbon disulfide. Filter through a small pledget of cotton, wash the cotton with an additional 5 mL of carbon disulfide, and allow the filtrate to evaporate spontaneously.

**Acceptance criteria:** The weight of the residue is NLT 6.0% of the weight of Benzoïn taken for Sumatra Benzoïn and NLT 12.0% for Siam Benzoïn. This residue meets the requirements for *Identification Tests—General* <191>, *Benzoate*.

### IMPURITIES

#### Inorganic Impurities

- **ARTICLES OF BOTANICAL ORIGIN**, *Acid-Insoluble Ash* <561>: NMT 1.0% in Sumatra Benzoïn; NMT 0.5% in Siam Benzoïn

### Organic Impurities

- **PROCEDURE: ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matter* <561>: NMT 1.0% in Siam Benzoïn

### SPECIFIC TESTS

#### • BOTANIC CHARACTERISTICS

**Sumatra Benzoïn:** Blocks or lumps of varying size, made up of tears, compacted together, with a reddish brown, reddish gray, or grayish brown resinous mass; the tears are externally yellowish or rusty brown, milky white on fresh fracture; hard and brittle at ordinary temperatures, but softened by heat.

**Siam Benzoïn:** Pebble-like tears of variable size and shape, compressed, yellowish brown to rusty brown externally, milky white on fracture, separate or very slightly agglutinated; hard and brittle at ordinary temperatures, but softened by heat.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate whether it is Sumatra Benzoïn or Siam Benzoïn.

## Compound Benzoïn Tincture

» Prepare Compound Benzoïn Tincture as follows.

Benzoïn, in moderately coarse powder . . . . .	100 g
Aloe, in moderately coarse powder . . . . .	20 g
Storax . . . . .	80 g
Tolu Balsam . . . . .	40 g
To make . . . . .	1000 mL

Prepare a *Tincture by Process M* (see *Pharmaceutical Dosage Forms* <1151>), using alcohol as the menstruum.

**Packaging and storage**—Preserve in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat.

**Labeling**—Label it to indicate that it is flammable.

**Specific gravity** <841>: between 0.870 and 0.885.

**Limit of nonvolatile residue**—Evaporate 3 mL of Tincture in a suitable tared dish on a steam bath, and dry the residue at 100   for 2 hours: the weight of the residue is between 525 mg and 675 mg.

**Alcohol content**, *Method II* <611>: between 74.0% and 80.0% of C<sub>2</sub>H<sub>5</sub>OH, the dilution to approximately 2% alcohol being made with methanol instead of with water.

## Benzonatate

C<sub>30</sub>H<sub>53</sub>NO<sub>11</sub> (av.) 603.74 (average)  
Benzoic acid, 4-(butylamino)-, 2,5,8,11,14,17,20,23,26-nonaoxaoctacos-28-yl ester.

2,5,8,11,14,17,20,23,26-Nonaaoctacosan-28-yl  
*p*-(butylamino)benzoate [104-31-4].

» Benzonatate contains not less than 95.0 per-  
 cent and not more than 105.0 percent of  
 $C_{30}H_{53}NO_{11}$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Benzonatate RS

**Identification**—

**A:** *Infrared Absorption* (197F).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 15 µg per mL.

*Medium:* water.

**Refractive index** (831): between 1.509 and 1.511 at 20°.

**Water, Method I** (921): not more than 0.3%.

**Residue on ignition** (281): not more than 0.1%.

**Chloride** (221)—Mix 20 mL of a solution (1 in 10) with 20 mL of water and 1 mL of nitric acid, shake for 1 hour, and allow to stand for 1 hour. Pass through a filter having a porosity of 0.2 µm, and to the filtrate add 1 mL of silver nitrate TS. Dilute with water to 50 mL, mix, and allow to stand protected from light for 10 minutes: the turbidity does not exceed that produced by 0.10 mL of 0.020 N hydrochloric acid (0.0035%).

**Sulfate** (221)—Mix 5 mL of a solution (1 in 20) with 5 mL of water and 1 mL of 3 N hydrochloric acid, shake for 1 hour, and allow to stand for 1 hour. Pass through a filter having a porosity of 0.2 µm, and to the filtrate add 1 mL of barium chloride TS. Mix, and allow to stand for 10 minutes: the turbidity does not exceed that produced by 0.10 mL of 0.020 N sulfuric acid (0.04%).

**Heavy metals, Method II** (231): 0.001%.

**Assay**—Weigh accurately about 5 g of Benzonatate, and reflux with 25.0 mL of 0.5 N sodium hydroxide VS for 1 hour. Cool, add 25 mL of water and 10 drops of bromothymol blue TS, and titrate the excess alkali with 0.5 N hydrochloric acid VS. Perform a blank determination (see *Residual Titrations under Titrimetry* (541)). Each mL of 0.5 N sodium hydroxide is equivalent to 301.5 mg of  $C_{30}H_{53}NO_{11}$ .

## Benzonatate Capsules

» Benzonatate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of benzonatate ( $C_{30}H_{53}NO_{11}$  av.).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Benzonatate RS

**Identification**—

**A:** The contents of the Capsules meet the requirements of *Identification* test A under *Benzonatate*. If a difference is observed, or if excipients are present, use an amount of the contents of Capsules equivalent to about 100 mg of benzonatate, mixed with 25 mL of 0.01 N hydrochloric acid, and proceed as directed under *Identification—Organic Nitrogenous Bases* (181), beginning with "Transfer the liquid to a separator."

**B:** The contents of the Capsules respond to *Identification* test B under *Benzonatate*.

**Dissolution** (711)—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

Determine the amount of benzonatate dissolved by employing the following method.

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and 0.04 M monobasic potassium phosphate (3:1). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

**Standard solution**—Transfer 50 mg, accurately weighed, of USP Benzonatate RS to a 100-mL volumetric flask, and add about 50 mL of water. Sonicate for 10 minutes, cool, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, and dilute with water to volume.

**Test solution**—Pass a portion of the solution under test through a 0.45-µm filter.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 310-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 15 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of benzonatate dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which  $r_U$  and  $r_S$  are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively;  $C_S$  is the concentration, in mg per mL, of USP Benzonatate RS in the *Standard solution*; 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and LC is the Tablet label claim, in mg.

**Tolerances**—Not less than 80% (Q) of the labeled amount of benzonatate is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Standard preparation**—Transfer about 50 mg of USP Benzonatate RS, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Assay preparation**—Mix a number of Capsules, equivalent to about 500 mg of benzonatate, with 40 mL of chloroform in a suitable high-speed blender, and dilute with chloroform to 100.0 mL. Transfer 10.0 mL of this solution, equivalent to about 50 mg of benzonatate, to a 100-mL volumetric flask, and evaporate the chloroform on a steam bath with the aid of a current of air. Dissolve the residue in water, dilute with water to volume, and mix.

**Procedure**—Transfer 4.0 mL each of the *Standard preparation*, the *Assay preparation*, and water to provide the blank, to separate test tubes. To each tube add in succession 1.0 mL of 1 M hydroxylamine hydrochloride and 1.0 mL of 3.5 N sodium hydroxide, mixing after each addition. Allow to stand for 10 minutes, accurately timed, then add 1.0 mL of 3.5 N hydrochloric acid, mix, add 1.0 mL of ferric chloride solution (8 in 100), and mix. Allow to stand for 30 minutes, accurately timed. Gently swirl the tubes for 1 minute to remove any gas bubbles present, then concomitantly determine the absorbances of the solutions in 1-cm cells, at the wavelength of maximum absorbance at about 500 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of benzonatate.

tate ( $C_{30}H_{53}NO_{11}$  av.) in the number of Capsules taken by the formula:

$$C(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Benzonatate RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Hydrous Benzoyl Peroxide

$C_{14}H_{10}O_4$  (anhydrous) 242.23  
Peroxide, dibenzoyl;  
Benzoyl peroxide [94-36-0].

### DEFINITION

Hydrous Benzoyl Peroxide contains NLT 90.0% and NMT 110.0% of the labeled amount of  $C_{14}H_{10}O_4$ . It contains a minimum of 20% of water for the purpose of reducing flammability and shock sensitivity.

**[CAUTION]**—Hydrous Benzoyl Peroxide may explode at temperatures higher than  $60^\circ$  or cause fires in the presence of reducing substances. Store it in the original container, treated to reduce static charges.]

### IDENTIFICATION

#### • A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

**Standard solution:** 10 mg/mL of Hydrous Benzoyl Peroxide, previously subjected to the *Assay*, in methanol

**Sample solution:** 10 mg/mL of benzoyl peroxide in methanol

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 5  $\mu\text{L}$

**Developing solvent system:** Toluene, dichloromethane, and glacial acetic acid (50:2:1)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Place the plate in a developing chamber containing and equilibrated with the *Developing solvent system*. Develop the chromatogram until the solvent front has moved three-fourths of the length of the plate. Remove the plate, and allow the solvent to evaporate. Observe the plate under short-wavelength UV light.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

#### • B. The *Sample solution* in the test for *Organic Impurities* exhibits a major peak for benzoyl peroxide, the retention time of which corresponds to that exhibited by the *Standard solution*.

### ASSAY

#### • PROCEDURE

**Sample:** 300 mg of previously mixed Hydrous Benzoyl Peroxide in a conical flask fitted with a ground-glass stopper. Weigh again to obtain the weight of the *Sample*.

**Analysis:** Add 30 mL of glacial acetic acid, previously sparged with carbon dioxide for NLT 2 min just before use, and swirl the flask gently to dissolve. Add 5 mL of potassium iodide solution (1 in 2), and mix. Allow the solution to stand for 1 min. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS. As the endpoint is

approached, add 1 drop of starch iodide paste TS, or equivalent, and continue the titration to the discharge of the blue color. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N sodium thiosulfate is equivalent to 12.11 mg of  $C_{14}H_{10}O_4$ .

**Acceptance criteria:** 90.0%–110.0% of the labeled amount

### IMPURITIES

#### Organic Impurities

##### • PROCEDURE

**Solution A:** Prepare a mixture of acetonitrile and glacial acetic acid (1000:1).

**Solution B:** Prepare a mixture of water and glacial acetic acid (1000:1).

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	18	82
20	60	40
30	60	40

**System suitability solution:** 100  $\mu\text{g/mL}$  of benzoic acid and 60  $\mu\text{g/mL}$  of methylparaben in acetonitrile

**Standard solution:** Dissolve a quantity of Hydrous Benzoyl Peroxide, previously subjected to the *Assay*, in acetonitrile to obtain a solution containing 0.32 mg/mL.

**Sample solution:** 0.32 mg/mL of benzoyl peroxide in acetonitrile

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 235 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Flow rate:** 1.2 mL/min

**Injection size:** 10  $\mu\text{L}$

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between benzoic acid and methylparaben

**Tailing factors:** NMT 2.0 for the benzoic acid and methylparaben peaks

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the area, as a percentage, of each peak in the chromatogram of the *Sample solution*:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for any individual peak other than the principal peak in the *Sample solution*

$r_T$  = sum of the peak responses of all the individual peaks including the principal peak in the *Sample solution*

**Acceptance criteria:** The area of any individual peak other than the principal peak is NMT 1.5% of the total area. The sum of the areas of all peaks other than the principal peak is NMT 2.0% of the total area.

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Store in the original container, at room temperature. [NOTE—Do not transfer Hydrous Benzoyl Peroxide to metal or glass containers fitted with friction tops. Do not return unused material to its original container, but destroy it by treatment with sodium hydroxide solution (1 in 10) until addition of a crystal of potassium iodide results in no release of free iodine.]

## Benzoyl Peroxide Gel

### DEFINITION

Benzoyl Peroxide Gel is benzoyl peroxide in a suitable gel base. It contains NLT 90.0% and NMT 125.0% of the labeled amount of benzoyl peroxide ( $C_{14}H_{10}O_4$ ).

### IDENTIFICATION

**A.** The retention time of the major peak for benzoyl peroxide of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Mobile phase:** Acetonitrile in water (5 in 10)

**Internal standard solution:** 3.6 mg/mL of ethyl benzoate in acetonitrile

**Standard stock solution:** 0.8 mg/mL of benzoyl peroxide prepared as follows. Transfer a suitable quantity of benzoyl peroxide, recently subjected to the *Assay* in Hydrous Benzoyl Peroxide, into a weighed conical flask fitted with a glass stopper. Weigh again to obtain the weight of the specimen, and quantitatively dissolve in acetonitrile.

**Standard solution:** 0.32 mg/mL of benzoyl peroxide prepared as follows. Mix 10 mL of *Standard stock solution* and 5 mL of *Internal standard solution*, and dilute with acetonitrile to 25 mL.

**Sample stock solution:** Transfer an equivalent to 40 mg of benzoyl peroxide from Gel into a 50-mL volumetric flask, add 40 mL of acetonitrile, and shake until the material is thoroughly dispersed. Sonicate the mixture for 5 min, dilute with acetonitrile to volume, mix, and filter.

**Sample solution:** 10 mL of *Sample stock solution* and 5 mL of *Internal standard solution*; dilute with acetonitrile to 25 mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution* (three replicate injections)

[NOTE—The retention times for ethyl benzoate and benzoyl peroxide are 7 and 14 min, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between ethyl benzoate and benzoyl peroxide

**Tailing factors:** NMT 2.0 for the ethyl benzoate and benzoyl peroxide peaks

**Peak response ratios:** The lowest and highest peak response ratios ( $R_s$ ) agree within 2.0%.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of benzoyl peroxide ( $C_{14}H_{10}O_4$ ) in the portion of Gel taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of benzoyl peroxide to ethyl benzoate from the *Sample solution*

$R_S$  = peak response ratio of benzoyl peroxide to ethyl benzoate from the *Standard solution*

$C_S$  = concentration of benzoyl peroxide in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of benzoyl peroxide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–125.0%

### IMPURITIES

#### ORGANIC IMPURITIES

**Solution A:** Acetonitrile and glacial acetic acid (1000:1)

**Solution B:** Water and glacial acetic acid (1000:1)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	18	82
20	60	40
30	60	40

**System suitability solution:** 100  $\mu$ g/mL of benzoic acid and 60  $\mu$ g/mL of methylparaben in acetonitrile

**Standard solution A:** 500  $\mu$ g/mL of benzoic acid in acetonitrile

**Standard solution B:** 20  $\mu$ g/mL of ethyl benzoate in acetonitrile

**Standard solution C:** 20  $\mu$ g/mL of benzaldehyde in acetonitrile

**Standard solution D:** Equivalent to 40  $\mu$ g/mL of anhydrous benzoyl peroxide in acetonitrile, prepared from hydrous benzoyl peroxide, which has been analyzed as follows. Place 300 mg of previously mixed hydrous benzoyl peroxide in a conical flask fitted with a ground-glass stopper. Weigh again to obtain the weight of the sample. Add 30 mL of glacial acetic acid, previously sparged with carbon dioxide for NLT 2 min just before use, and swirl the flask gently to dissolve. Add 5 mL of potassium iodide solution (1 in 2), and mix. Allow the solution to stand for 1 min. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS. As the endpoint is approached, add 1 drop of starch iodide paste TS, or equivalent, and continue the titration to the discharge of the blue color. Perform a blank determination, and make any necessary correction (see *Titrimetry* <541>). Each mL of 0.1 N sodium thiosulfate is equivalent to 12.11 mg of hydrous benzoyl peroxide ( $C_{14}H_{10}O_4$ ).

**Sample solution:** Transfer an amount of Gel equivalent to 100 mg of benzoyl peroxide to a 50-mL volumetric flask, and add 25 mL of acetonitrile. Shake vigorously to disperse the specimen, sonicate for 5 min, dilute with acetonitrile to volume, and filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 235 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Flow rate:** 1.2 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between benzoic acid and methylparaben

**Tailing factor:** NMT 2.0 for the benzoic acid and methylparaben peaks

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

**Acceptance criteria:** The responses of any peaks from the *Sample solution* corresponding to benzoic acid, ethyl benzoate, and benzaldehyde are NMT those of the main peaks from *Standard solution A* (25%), *Standard solution B* (1%), and *Standard solution C* (1%), respectively. The response of any other impurity peak from the *Sample solution*—other than the main benzoyl peroxide peak, any benzoic acid, ethyl benzoate, benzalde-

hyde, methylparaben, or propylparaben peak, and any solvent peak—is NMT that from *Standard solution D* (2%); and the sum of the responses of all the impurity peaks—other than those of benzoic acid, ethyl benzoate, and benzaldehyde—is NMT that from *Standard solution D* (2%).

**SPECIFIC TESTS**

- **pH** (791): 2.8–6.6

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.

---

**Benzoyl Peroxide Lotion**

---

» Benzoyl Peroxide Lotion is benzoyl peroxide in a suitable lotion base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{14}H_{10}O_4$ .

**Packaging and storage**—Preserve in tight containers.

**Identification—**

**A:** Dilute a quantity of Lotion with acetone to obtain a solution having a concentration of benzoyl peroxide equivalent to 10 mg per mL, and proceed with the solution so obtained as directed in the *Identification* test A under *Hydrous Benzoyl Peroxide*, beginning with “Apply 5  $\mu$ L of this solution.” The solution responds to the test.

**B:** It responds to the *Identification* test under *Benzoyl Peroxide Gel*.

**pH** (791): between 2.8 and 6.6.

**Related compounds—**

*Solution A, Solution B, Mobile phase, Standard preparation A, Standard preparation B, Standard preparation C, Standard preparation D, System suitability solution, and Chromatographic system*—Proceed as directed in the test for *Related compounds* under *Benzoyl Peroxide Gel*.

**Test preparation**—Transfer an accurately weighed quantity of Lotion, equivalent to about 100 mg of benzoyl peroxide, to a 50-mL volumetric flask, add 25 mL of acetonitrile, shake vigorously to disperse the specimen, sonicate for 5 minutes, dilute with acetonitrile to volume, mix, and filter.

**Procedure**—Proceed with Lotion as directed for *Procedure* in the test for *Related compounds* under *Benzoyl Peroxide Gel*; it meets the limits stated.

**Assay—**

*Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Benzoyl Peroxide Gel*.

**Assay preparation**—Prepare as directed for *Assay preparation* in the *Assay* under *Benzoyl Peroxide Gel*, using Lotion.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Benzoyl Peroxide Gel*. Calculate the quantity, in mg, of  $C_{14}H_{10}O_4$  in the portion of Lotion taken by the formula:

$$125C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of benzoyl peroxide in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of benzoyl peroxide peak response to ethyl benzoate peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

**Benztropine Mesylate**

---

$C_{21}H_{25}NO \cdot CH_4O_3S$  403.53

8-Azabicyclo[3.2.1]octane, 3-(diphenylmethoxy)-, *endo*-, methanesulfonate;  
3 $\alpha$ -(Diphenylmethoxy)-1 $\alpha$ H,5 $\alpha$ H-tropane methanesulfonate [132-17-2].

**DEFINITION**

Benztropine Mesylate contains NLT 98.0% and NMT 100.5% of benztropine mesylate ( $C_{21}H_{25}NO \cdot CH_4O_3S$ ), calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)

**ASSAY**

- **PROCEDURE**

**Sample:** 60 mg of Benztropine Mesylate

**Analysis:** Dissolve the *Sample* in 25 mL of water, add 5 mL of sodium carbonate TS, and extract with four 10-mL portions of chloroform. Wash the combined chloroform extracts with about 10 mL of water, and extract the wash solution with 5 mL of chloroform. Filter the combined chloroform extracts through a tightly packed pledget of cotton, and wash the cotton with about 5 mL of chloroform. Add methyl red TS, and titrate the chloroform solution with 0.01 N perchloric acid in dioxane VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.01 N perchloric acid is equivalent to 4.035 mg of benztropine mesylate ( $C_{21}H_{25}NO \cdot CH_4O_3S$ ).  
**Acceptance criteria:** 98.0%–100.5% on the dried basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.1%

**SPECIFIC TESTS**

- **MELTING RANGE OR TEMPERATURE** (741): 141°–148°
- **LOSS ON DRYING** (731)

**Analysis:** Dry a sample at 105° for 2 h.

**Acceptance criteria:** NMT 5.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)  
USP Benztropine Mesylate RS

---

**Benztropine Mesylate Injection**

---

**DEFINITION**

Benztropine Mesylate Injection is a sterile solution of Benztropine Mesylate in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of benztropine mesylate ( $C_{21}H_{25}NO \cdot CH_4O_3S$ ).

**IDENTIFICATION**

- **A.**  
**Standard stock solution:** 0.2 mg/mL of USP Benztropine Mesylate RS  
**Standard solution:** In a separator containing the *Standard stock solution* add 2 mL of 1 N sodium hydroxide.

Extract with three 10-mL portions of chloroform, collecting the chloroform extracts to a 50-mL beaker. Evaporate the chloroform extracts with the aid of gentle heat and a current of air to dryness, and dissolve the residue in 1 mL of chloroform.

**Sample stock solution:** Dilute a volume of Injection, equivalent to 10 mg of bzotropine mesylate, in a separator to 50 mL with water (0.2 mg/mL).

**Sample solution:** In a separator containing the *Sample stock solution* add 2 mL of 1 N sodium hydroxide. Extract with three 10-mL portions of chloroform, collecting the chloroform extracts to a 50-mL beaker. Evaporate the chloroform extracts with the aid of gentle heat and a current of air to dryness, and dissolve the residue in 1 mL of chloroform.

#### Chromatographic system

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 1  $\mu$ L

**Developing solvent system:** Chloroform, methanol, and a 1-in-4 solution of ammonium hydroxide (40:10:1)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Allow the applications to dry, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with potassium iodoplatinate TS.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

#### ASSAY

##### • PROCEDURE

**Buffer:** Transfer 0.83 mL of octylamine to a 1-L volumetric flask, dilute with water to volume, and adjust with phosphoric acid to a pH of 3.0.

**Mobile phase:** Acetonitrile and *Buffer* (65:35)

**Standard solution:** 1 mg/mL of USP Bzotropine Mesylate RS

**Sample solution:** Nominally 1 mg/mL of bzotropine mesylate from the volume of Injection

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 259 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L7

**Flow rate:** 1.3 mL/min adjusted, as needed, to obtain a retention time of 7 min for bzotropine mesylate

**Injection volume:** 25  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of labeled amount of bzotropine mesylate ( $C_{21}H_{25}NO \cdot CH_3O_3S$ ) in each mL of the Injection:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Bzotropine Mesylate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of bzotropine mesylate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** NMT 55.6 USP Endotoxin Units/mg of bzotropine mesylate
- **pH (791):** 5.0–8.0
- **OTHER REQUIREMENTS:** Meets the requirements in *Injections* <1>

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.
- **USP REFERENCE STANDARDS (11)**  
USP Bzotropine Mesylate RS  
USP Endotoxin RS

## Bzotropine Mesylate Tablets

#### DEFINITION

Bzotropine Mesylate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bzotropine mesylate ( $C_{21}H_{25}NO \cdot CH_3O_3S$ ).

#### IDENTIFICATION

##### • A.

**Standard stock solution:** 0.2 mg/mL of USP Bzotropine Mesylate RS

**Standard solution:** In a separator containing the *Standard stock solution* add 2 mL of 1 N sodium hydroxide. Extract with three 10-mL portions of chloroform, collecting the chloroform extracts to a 50-mL beaker. Evaporate the chloroform extracts with the aid of gentle heat and a current of air to dryness, and dissolve the residue in 1 mL of chloroform.

**Sample stock solution:** Dissolve a portion of finely powdered Tablets, equivalent to 10 mg of bzotropine mesylate, in 50 mL of water, shake by mechanical means for 30 min, and filter into a separator (0.2 mg/mL).

**Sample solution:** In a separator containing the *Sample stock solution* add 2 mL of 1 N sodium hydroxide. Extract with three 10-mL portions of chloroform, collecting the chloroform extracts to a 50-mL beaker. Evaporate the chloroform extracts with the aid of gentle heat and a current of air to dryness, and dissolve the residue in 1 mL of chloroform.

#### Chromatographic system

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 1  $\mu$ L

**Developing solvent system:** Chloroform, methanol, and a 1-in-4 solution of ammonium hydroxide (40:10:1)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Allow the applications to dry, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with potassium iodoplatinate TS.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

**ASSAY****• PROCEDURE**

**Buffer:** Transfer 0.83 mL of octylamine to a 1-L volumetric flask, dilute to volume, and adjust with phosphoric acid to a pH of 3.0.

**Diluent:** Isopropyl alcohol, water, and phosphoric acid (40: 60: 0.1)

**Mobile phase:** Acetonitrile and *Buffer* (45:55)

**Standard solution:** 0.04 mg/mL of USP Benztropine Mesylate RS in *Diluent*

**Sample solution:** Nominally 0.04 mg/mL of benztropine mesylate from a suitable amount of powdered Tablets in *Diluent* prepared as follows. Add a suitable amount of fine powder from NLT 20 Tablets to a portion of *Diluent* corresponding to 60% of the final volume. Mix by mechanical means for NLT 60 min, and dilute with *Diluent* to volume. Centrifuge a portion of this mixture, and filter the supernatant layer.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 259 nm

**Column:** 4.6-mm × 25-cm; packing L7

**Flow rate:** 0.7 mL/min

**Injection volume:** 50 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 4.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of benztropine mesylate ( $C_{21}H_{25}NO \cdot CH_4O_3S$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Benztropine Mesylate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of benztropine mesylate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS****• DISSOLUTION <711>**

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

Determine the amount of benztropine mesylate ( $C_{21}H_{25}NO \cdot CH_4O_3S$ ) dissolved by using the following method.

**Buffer:** Transfer 0.83 mL of octylamine to a 1-L volumetric flask, dilute to volume, and adjust with phosphoric acid to a pH of 3.0.

**Mobile phase:** Acetonitrile and *Buffer* (65:35)

**Standard solution:** USP Benztropine Mesylate RS in *Medium*. Dilute to obtain a solution having a known concentration similar to that of the *Sample solution*.

**Sample solution:** Use a filtered portion of the solution under test from the dissolution vessel.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; packing L7

**Flow rate:** 2 mL/min

**Injection volume:** 300 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 3.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of benztropine mesylate ( $C_{21}H_{25}NO \cdot CH_4O_3S$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Benztropine Mesylate RS in the *Standard solution* (mg/mL)

$V$  = volume of the *Medium*, 900 mL

$L$  = label claim (mg/Tablet)

**Acceptance criteria:** NLT 80% (Q) of the labeled amount of benztropine mesylate ( $C_{21}H_{25}NO \cdot CH_4O_3S$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS <11>**

USP Benztropine Mesylate RS

---

**Benzyl Benzoate**

---

$C_{14}H_{12}O_2$

212.24

Benzoic acid, phenylmethyl ester;  
Benzyl benzoate [120-51-4].

**DEFINITION**

Benzyl Benzoate contains NLT 99.0% and NMT 100.5% of  $C_{14}H_{12}O_2$ .

**IDENTIFICATION**

- **A. INFRARED ABSORPTION <197F>**

**ASSAY****• PROCEDURE**

**Sample:** 2 g of Benzyl Benzoate

**Analysis:** Transfer the *Sample* to a conical flask fitted with a reflux condenser. Add 50.0 mL of 0.5 N alcoholic potassium hydroxide VS, and boil gently for 1 h. Cool, add phenolphthalein TS, and titrate with 0.5 N hydrochloric acid VS. Perform a blank determination (see *Titrimetry* <541>). Each mL of 0.5 N alcoholic potassium hydroxide is equivalent to 106.1 mg of Benzyl Benzoate ( $C_{14}H_{12}O_2$ ).

**Acceptance criteria:** 99.0%–100.5%

**IMPURITIES****• LIMIT OF ALDEHYDES**

**Sample solution:** Transfer 10.0 g to a 125-mL conical flask containing 50 mL of alcohol and 5 mL of hydroxylamine hydrochloride solution (3.5 in 100), mix, and allow to stand for 10 min.

**Analysis:** Add 1 mL of bromophenol blue TS, and titrate with 0.1 N sodium hydroxide VS to a light green endpoint. Perform a blank determination, and match the color of the endpoint with that of the titrated *Sample solution*.

**Acceptance criteria:** The net volume of 0.1 N sodium hydroxide consumed does not exceed 0.50 mL (0.05% as benzaldehyde).

#### SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 1.116–1.120
- **CONGEALING TEMPERATURE** (651): Congelation may be brought about by the addition of a fragment of previously congealed Benzyl Benzoate when the temperature has reached the expected congealing temperature.  
**Acceptance criteria:** NLT 18.0°
- **REFRACTIVE INDEX** (831): 1.568–1.570 at 20°
- **ACIDITY:** Add 2 drops of phenolphthalein TS to 25 mL of alcohol, and add 0.020 N sodium hydroxide until a pink color is produced. Add 5.0 g of Benzyl Benzoate, and titrate with 0.020 N sodium hydroxide.  
**Acceptance criteria:** NMT 1.5 mL of 0.020 N sodium hydroxide is required to restore the pink color.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, well-filled, light-resistant containers, and avoid exposure to excessive heat.
- **USP REFERENCE STANDARDS** (11)  
USP Benzyl Benzoate RS

### Benzyl Benzoate Lotion

» Benzyl Benzoate Lotion contains not less than 26.0 percent and not more than 30.0 percent (w/w) of  $C_{14}H_{12}O_2$ .

Benzyl Benzoate . . . . .	250 mL
Triethanolamine . . . . .	5 g
Oleic Acid . . . . .	20 g
Purified Water . . . . .	750 mL
To make about . . . . .	1000 mL

Mix the Triethanolamine with the Oleic Acid, add the Benzyl Benzoate, and mix. Transfer the mixture to a suitable container of about 2000-mL capacity, add 250 mL of Purified Water, and shake the mixture thoroughly. Finally add the remaining Purified Water, and again shake thoroughly.

**Packaging and storage**—Preserve in tight containers.

**pH** (791): between 8.5 and 9.2.

**Assay**—Place about 5 g of Lotion, accurately weighed, in a conical flask. Add 25 mL of alcohol and 2 drops of phenolphthalein TS. Cool the solution to about 15°, and titrate quickly with 0.1 N sodium hydroxide to a slight pink color. Add 50.0 mL of 0.5 N alcoholic potassium hydroxide VS, connect the flask to a reflux condenser, and boil gently for 1 hour. Cool, promptly add phenolphthalein TS, and titrate with 0.5 N hydrochloric acid VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.5 N alcoholic potassium hydroxide is equivalent to 106.1 mg of  $C_{14}H_{12}O_2$ .

### Benzylpenicilloyl Polylysine Concentrate

» Benzylpenicilloyl Polylysine Concentrate has a molar concentration of benzylpenicilloyl moiety ( $C_{16}H_{19}N_2O_5S$ ) of not less than 0.0125 M and not more than 0.020 M. It contains one or more suitable buffers.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The label states that this article is not intended for direct administration to humans or animals.

**USP Reference standards** (11)—

USP L-Lysine Hydrochloride RS

**pH** (791): between 6.5 and 8.5, the undiluted Concentrate being used.

**Limit of penicillenate and penamaldate**—Transfer 1 mL of Concentrate to a 50-mL volumetric flask, dilute with *Saline phosphate buffer*, prepared as directed in the *Assay*, to volume, and mix. Using a suitable spectrophotometer and using *Saline phosphate buffer* as a blank, determine the absorbances at the wavelengths of maximum absorption at about 322 nm and 282 nm. Calculate the molar concentration of penicillenate taken by the formula:

$$50A_{322} / 26,600b$$

in which  $A_{322}$  is the absorbance at 322 nm, 26,600 is the molar absorptivity of the penicillenate moiety at pH 7.6, and  $b$  is the length of the cell, in cm: not more than 0.00020 M is found. Calculate the molar concentration of penamaldate taken by the formula:

$$50A_{282} / 22,325b$$

in which  $A_{282}$  is the absorbance at 282 nm, 22,325 is the molar absorptivity of the penamaldate moiety at pH 7.6, and  $b$  is the length of the cell, in cm: not more than 0.00060 M is found.

#### Benzylpenicilloyl substitution—

**Citrate buffer**—Dissolve 19.69 g of sodium citrate dihydrate, 0.1 mL of pentachlorophenol, and 5 mL of 2,2'-thiodiethanol in 900 mL of 0.2 N hydrochloric acid, adjust with hydrochloric acid to a pH of 2.2, dilute with water to 1000 mL, and mix.

**Ninhydrin reagent**—Dissolve 18 g of ninhydrin and 0.7 g of hydrindantin in 675 mL of dimethyl sulfoxide, add 225 mL of 4 M lithium acetate solution previously adjusted with glacial acetic acid to a pH of 5.2, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP L-Lysine Hydrochloride RS in *Citrate buffer* to obtain a solution having a known concentration of about 91 µg per mL ( $5 \times 10^{-4}$  M).

**Test preparation**—Transfer 1.0 mL of Concentrate to a 10-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to an ampul, add 1.5 mL of 6 N hydrochloric acid, and seal the ampul under nitrogen. Heat the ampul at 110° for 22 hours. Transfer the contents of the ampul to a round-bottom, 50-mL flask, and dry by vacuum rotary evaporation. Dissolve the residue three times, using 5-mL portions of water, evaporating to dryness after each dissolution. Dissolve the residue in 10 mL of *Citrate buffer*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 1.75-mm × 50-cm column that contains a packing of 8-µm 8% cross-linked sulfonated divinylbenzene polystyrene cation-exchange resin. The column effluent is mixed continuously with flowing *Ninhydrin reagent*, and the flowing mixture is heated at 130° for 1.5 minutes in a reaction coil. The absorbance of

the reaction mixture is measured continuously by a 570-nm detector. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 1800 theoretical plates, and the relative standard deviation for replicate injections is not more than 4.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The retention time is about 57 minutes for L-lysine. Calculate the molar concentration of lysine in the Concentrate taken by the formula:

$$(0.1C/182.65)(r_U / r_S)$$

in which *C* is the concentration, in  $\mu$ g per mL, of USP L-Lysine Hydrochloride RS in the *Standard preparation*; 182.65 is the molecular weight of anhydrous lysine hydrochloride; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively. Calculate the percentage of benzylpenicilloyl substitution taken by the formula:

$$100(B/L)$$

in which *B* is the molar concentration of benzylpenicilloyl moiety in the Concentrate, as determined in the *Assay*; and *L* is the molar concentration of lysine in the Concentrate: not less than 50% and not more than 70% is found.

#### Assay—

**Saline phosphate buffer**—Dissolve 9 g of sodium chloride and 1.38 g of monobasic sodium phosphate in 900 mL of water, adjust with 5 N sodium hydroxide or phosphoric acid to a pH of 7.6, dilute with water to 1000 mL, and mix.

**Mercuric chloride solution**—Dissolve 35 mg of mercuric chloride in 500 mL of water, and mix.

**Assay preparation**—Transfer 1.0 mL of Concentrate to a 500-mL volumetric flask, dilute with *Saline phosphate buffer* to volume, and mix.

**Procedure**—Transfer 3.0 mL of *Assay preparation* to a spectrophotometric cell. Using a suitable spectrophotometer and using *Saline phosphate buffer* as the blank, determine the initial absorbance at the wavelength of maximum absorbance at about 282 nm. Add 0.02 mL of *Mercuric chloride solution* to the *Assay preparation* in the spectrophotometric cell, mix, and determine the absorbance at the same wavelength after 1 and 3 minutes. Repeat the addition of 0.02-mL portions of *Mercuric chloride solution* until a maximum absorbance reading is obtained. Calculate the molar concentration of benzylpenicilloyl moiety in the Concentrate taken by the formula:

$$500\{[A_m(3 + 0.02n)/3] - A_i\}/22,325b$$

in which  $A_m$  is the highest absorbance observed;  $A_i$  is the initial absorbance, *n* is the number of 0.02-mL portions of *Mercuric chloride solution* added to the *Assay preparation* to obtain the maximum absorbance; 22,325 is the molar absorptivity of the penamaldate formed by the reaction of benzylpenicilloyl with mercuric chloride at pH 7.6; and *b* is the length of the cell, in cm: between 0.0125 M and 0.020 M is found.

## Benzylpenicilloyl Polylysine Injection

» Benzylpenicilloyl Polylysine Injection has a molar concentration of benzylpenicilloyl moiety

( $C_{16}N_2H_{19}O_5S$ ) of not less than  $5.4 \times 10^{-5}$  M and not more than  $7.0 \times 10^{-5}$  M. It contains one or more suitable buffers.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, in a refrigerator.

#### USP Reference standards (11)—

USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 5833.0 USP Endotoxin Units per mL.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

**pH** (791): between 6.5 and 8.5.

#### Assay—

**Saline phosphate buffer** and **Mercuric chloride solution**—Prepare as directed in the *Assay* under *Benzylpenicilloyl Polylysine Concentrate*.

**Assay preparation**—Combine the contents of a sufficient number of containers to obtain not less than 3 mL of Injection. Transfer 3.0 mL of Injection to a 10-mL volumetric flask, dilute with *Saline phosphate buffer* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Benzylpenicilloyl Polylysine Concentrate*. Calculate the molar concentration of benzylpenicilloyl moiety in the Injection taken by the formula:

$$(10 / 3)\{[A_m(3 + 0.02n) / 3] - A_i\} / 22,325b$$

in which the terms are as defined therein.

## Beta Carotene

$C_{40}H_{56}$

536.87

$\beta,\beta$ -Carotene;

all-*trans*- $\beta$ -Carotene;

(all-*E*)-1,1'-(3,7,12,16-Tetramethyl-1,3,5,7,9,11,13,15,17-octadecanonaene-1,18-diyl)bis[2,6,6-trimethylcyclohexene] [7235-40-7].

#### DEFINITION

Beta Carotene contains NLT 96.0% and NMT 101.0% of total carotenoids calculated as beta carotene ( $C_{40}H_{56}$ ). It contains NLT 95.0% of all-*trans*-beta carotene in the total carotenoids content.

#### IDENTIFICATION

##### • A.

**Sample solution:** Prepare as directed for the *Sample solution* in the test for *Content of Total Carotenoids*.

**Analysis:** Record the UV-Vis spectrum from 300–600 nm.

**Acceptance criteria:** The *Sample solution* shows a shoulder at about 427 nm, an absorption maximum at about 455 nm, and another maximum at about 483 nm. The absorbance ratio  $A_{455}/A_{483}$  is 1.14–1.18.

• B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Content of Beta Carotene*.

**ASSAY****COMPOSITION****• CONTENT OF TOTAL CAROTENOIDS**

[NOTE—Use low-actinic glassware.]

**Sample stock solution:** 0.1 mg/mL of Beta Carotene in tetrahydrofuran**Sample solution:** Transfer 3.0 mL of *Sample stock solution* into a 100-mL volumetric flask, and dilute with cyclohexane to volume.**Instrumental conditions**(See *Spectrophotometry and Light-Scattering* (851).)**Analytical wavelength:** 457 nm**Cell path:** 1 cm**Blank:** Cyclohexane**Analysis****Sample:** *Sample solution*Calculate the percentage of total carotenoids (*T*) as beta carotene (C<sub>40</sub>H<sub>56</sub>):

$$T = A/(F \times C)$$

*A* = absorbance of the *Sample solution**F* = 2505, coefficient of extinction (E<sup>1%</sup>) of pure all-*trans*-beta carotene in cyclohexane (100 mL · g<sup>-1</sup> · cm<sup>-1</sup>)*C* = concentration of *Sample solution* (g/mL)**Acceptance criteria:** 96.0%–101.0% of total carotenoids as beta carotene (C<sub>40</sub>H<sub>56</sub>)**• CONTENT OF BETA CAROTENE**

[NOTE—Use low-actinic glassware.]

**Mobile phase:** Transfer 50 mg of butylated hydroxytoluene into a 1-L volumetric flask and dissolve with 20 mL of 2-propanol. Add 0.2 mL of *N*-ethyl-diisopropylamine, 25 mL of 0.2% ammonium acetate solution, 455 mL of acetonitrile, and about 450 mL of methanol. Allow the solution to reach room temperature, and dilute with methanol to volume.**Diluent:** 50 µg/mL of butylated hydroxytoluene in alcohol**System suitability solution:** Transfer 20 mg of USP Beta Carotene System Suitability RS to a 50-mL volumetric flask. Add 1 mL of water, 4 mL of tetrahydrofuran, and sonicate for 5 min. Dilute with *Diluent* to volume, and sonicate for 5 min. Cool to room temperature, pass the suspension through a membrane filter of 0.45-µm pore size, and use the clear filtrate.**Standard solution:** 10 µg/mL of USP Beta Carotene RS in tetrahydrofuran and *Diluent* (1:9). Dissolve an appropriate amount of USP Beta Carotene RS in a volumetric flask first with tetrahydrofuran, using 10% of the volume of the flask, then complete with *Diluent* to volume.**Sample solution:** Dilute the freshly prepared *Sample stock solution* as prepared in the test for *Content of Total Carotenoids* (1 in 10) with *Diluent*.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 448 nm**Column:** 4.6-mm × 25-cm; 5-µm packing L68**Column temperature:** 30°**Flow rate:** 0.6 mL/min**Injection size:** 20 µL**System suitability****Samples:** *System suitability solution* and *Standard solution*The approximate relative retention times of the components in the *System suitability solution* are listed in *Table 1*.**Table 1**

Analyte	Relative Retention Time	Relative Response Factor
all- <i>trans</i> -Alpha carotene	0.93	1.1
all- <i>trans</i> -Beta carotene	1.00	1
9- <i>cis</i> -Beta carotene	1.07	1
13- <i>cis</i> -Beta carotene	1.17	1.2

---

**Beta Carotene Capsules**

---

**DEFINITION**

Beta Carotene Capsules contain NLT 90% and NMT 125.0% of the labeled amount of total beta carotene ( $C_{40}H_{56}$ ), of which NLT 95.0% is the all-*trans*-beta carotene isomer.

**IDENTIFICATION**

- **A.**

**Sample solution:** Dilute the *Sample stock solution* of the test for *Content of Total Beta Carotene* with cyclohexane to a final concentration of between 1 and 5 µg/mL of beta carotene. Pass through a membrane filter of 0.45-µm pore size.

**Analysis:** Record the UV-Vis spectrum from 300 to 600 nm.

**Acceptance criteria:** The *Sample solution* shows a shoulder at about 427 nm, an absorption maximum at about 455 nm, and another maximum at about 483 nm. The absorbance ratio  $A_{455}/A_{483}$  is between 1.14 and 1.18.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Total Beta Carotene*.

**ASSAY**• **CONTENT OF TOTAL BETA CAROTENE**

[NOTE—Use low-actinic glassware.]

**Mobile phase:** Transfer 50 mg of butylated hydroxytoluene into a 1-L volumetric flask, and dissolve with 20 mL of 2-propanol. Add 0.2 mL of *N*-ethyl-diisopropylamine, 25 mL of 0.2% ammonium acetate solution, 455 mL of acetonitrile, and about 450 mL of methanol. Allow the solution to reach room temperature, and dilute with methanol to volume.

**Diluent:** 50 mg/L of butylated hydroxytoluene in alcohol

**System suitability solution:** Transfer 20 mg of USP Beta Carotene System Suitability RS to a 50-mL volumetric flask. Add 1 mL of water and 4 mL of tetrahydrofuran, and sonicate for 5 min. Dilute with *Diluent* to volume, and sonicate for 5 min. Cool to room temperature, pass through a membrane filter of 0.45-µm pore size, and use the clear filtrate.

**Standard stock solution:** 60 µg/mL of USP Beta Carotene RS in tetrahydrofuran. [NOTE—The USP Beta Carotene RS is subjected to the spectrophotometric purity

test at the time of analysis; see the determination of the concentration of *Standard solution A*, below.]

**Standard solution A:** Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, add 5.0 mL of tetrahydrofuran, and dilute with *Diluent* to volume. Determine the concentration of *Standard solution A* according to the *Analysis of Standard solution B*. [NOTE—The concentration of *Standard solution B* equals the concentration of *Standard solution A*.]

**Standard solution B:** Transfer 5.0 mL of the *Standard stock solution* into a 100-mL volumetric flask, and dilute with cyclohexane to volume. Prepare in triplicate.

**Instrumental conditions**(See *Spectrophotometry and Light-Scattering* (851).)**Analytical wavelength:** 457 nm**Cell:** 1 cm**Blank:** Cyclohexane**Analysis****Sample:** *Standard solution B*

Calculate the concentration of total beta carotene (µg/mL) as all-*trans*-beta carotene ( $C_{40}H_{56}$ ) in *Standard solution B*:

$$\text{Result} = (A_U/a) \times F$$

$A_U$  = average absorbance of the three preparations of *Standard solution B*

$a$  = absorptivity of pure all-*trans*-beta carotene in cyclohexane at 457 nm ( $\text{mL} \cdot \text{mg}^{-1} \cdot \text{cm}^{-1}$ ), 250

$F$  = conversion factor from mg to µg (µg/mg), 1000

**Sample stock solution:** Randomly select a number of Capsules, equivalent to 10–50 mg of beta carotene, with a total weight not exceeding 5 g. For powder-containing Capsules, empty the shell, and transfer shell and contents into a 250-mL volumetric flask. For Capsules containing liquid formulations, place the Capsules directly into a 250-mL volumetric flask. Add 250 mg of butylated hydroxytoluene, 0.5 mL of alkaline protease R, and 15 mL of water. Swirl the flask gently to wet the entire contents. Sonicate the flask at 50° for 30 min, and swirl the flask every 10 min. Add 100 mL of alcohol to the warm suspension, and shake vigorously. Add 110 mL of methylene chloride, and shake vigorously again. Disperse any clumps with homogenizer, and rinse the homogenizer probe with 15 mL of methylene chloride into the flask. Allow the solution to stand in the dark until it reaches room temperature (about 2 h), dilute with methylene chloride to volume, shake vigorously, and allow the solids to settle.

**Sample solution:** Dilute a volume of the *Sample stock solution* with a *Diluent*–methylene chloride mixture (1:1) so that the final concentration of beta carotene is between 1 and 5 µg/mL. Pass through a membrane filter of 0.45-µm pore size.

**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 448 nm**Column:** 4.6-mm × 25-cm; 5-µm packing L68**Column temperature:** 30°**Flow rate:** 0.6 mL/min**Injection size:** 20 µL**System suitability**

**Samples:** *System suitability solution* and *Standard solution A*

[NOTE—The approximate relative retention times of the components in the *System suitability solution* are listed in Table 1.]

Table 1

Name	Relative Retention Time	Relative Response Factor
all- <i>trans</i> -Alpha carotene	0.93	1.1
all- <i>trans</i> -Beta carotene	1.00	1
9- <i>cis</i> -Beta carotene	1.07	1
13- <i>cis</i> -Beta carotene	1.17	1.2
15- <i>cis</i> -Beta carotene	1.21	1.4

**Suitability requirements**

**Chromatogram similarity:** The chromatogram from the *System suitability solution* is similar to the Reference Chromatogram provided with the USP Beta Carotene System Suitability RS being used.

**Resolution:** NLT 1.5 between all-*trans*-beta carotene and all-*trans*-alpha carotene and between all-*trans*-beta carotene and 9-*cis*-beta carotene, *System suitability solution*

**Tailing factor:** NMT 2.0 for the all-*trans*-beta carotene peak, *Standard solution A*

**Relative standard deviation:** NMT 2.0% for the all-*trans*-beta carotene peak from replicate injections, *Standard solution A*

**Analysis**

**Samples:** *Standard solution A* and *Sample solution*  
Identify the peaks of the relevant analytes of the *Sample solution* by comparing with those of the *System suitability solution*. Measure the peak area responses. Calculate the percentage of the labeled amount of total beta carotene in the Capsules taken:

$$\text{Result} = (\Sigma r_U / r_S) \times (C_S / C_U) \times 100$$

$\Sigma r_U$  = [(peak area of all-*trans*-beta carotene) + (peak area of 9-*cis*-beta carotene) + (peak area of 13-*cis*-beta carotene  $\times$  1.2) + (peak area of 15-*cis*-beta carotene  $\times$  1.4) from the *Sample solution*]

$r_S$  = peak area of all-*trans*-beta carotene from *Standard solution A*

$C_S$  = concentration of all-*trans*-beta carotene in *Standard solution A* as determined above ( $\mu\text{g/mL}$ )

$C_U$  = nominal concentration of total beta carotene in the *Sample solution* ( $\mu\text{g/mL}$ )

Calculate the percentage of all-*trans*-beta carotene in the portion of Capsules taken:

$$\text{Result} = (r_{\text{all-trans}} / \Sigma r_U) \times 100$$

$r_{\text{all-trans}}$  = peak area of all-*trans*-beta carotene from the *Sample solution*

$\Sigma r_U$  = [(peak area of all-*trans*-beta carotene) + (peak area of 9-*cis*-beta carotene) + (peak area of 13-*cis*-beta carotene  $\times$  1.2) + (peak area of 15-*cis*-beta carotene  $\times$  1.4) from the *Sample solution*]

**Acceptance criteria:** 90%–125.0% of the labeled amount of total beta carotene ( $\text{C}_{40}\text{H}_{56}$ ), of which NLT 95.0% is the all-*trans*-beta carotene isomer

**SPECIFIC TESTS**• **ALPHA CAROTENE AND OTHER RELATED COMPOUNDS**

**Mobile phase, System suitability solution, Sample solution, and Chromatographic system:** Proceed as directed in the test for *Content of Total Beta Carotene*.

**Analysis**

**Sample:** *Sample solution*

**Injection size:** 20  $\mu\text{L}$

Calculate the percentage of alpha carotene and other individual related compounds relative to total beta carotene in the portion of Capsules taken:

$$\text{Result} = (r_U / r_T) \times 100$$

$r_U$  = peak area of alpha carotene or other individual related compounds

$r_T$  = sum of the areas of all the peaks

**Acceptance criteria**

**Alpha carotene:** NMT 1.0%

**Total related compounds** (including alpha carotene): NMT 5.0%

**PERFORMANCE TESTS**

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** The label states the name and content of any carriers and antioxidants added to the formulation and the content of total carotenoids as beta carotene.
- **USP REFERENCE STANDARDS** (11)  
USP Beta Carotene RS  
(all-*E*)-1,1'-(3,7,12,16-Tetramethyl-1,3,5,7,9,11,13,15,17-octadecanonaene-1,18-diyl)bis[2,6,6-trimethylcyclohexene].  
 $\text{C}_{40}\text{H}_{56}$  536.87  
USP Beta Carotene System Suitability RS

**Betahistine Hydrochloride**

$\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{HCl}$  209.12

2-Pyridineethanamine, *N*-methyl-, dihydrochloride.

2-[2-(Methylamino)ethyl]pyridine dihydrochloride [5579-84-0].

» Betahistine Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of  $\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{HCl}$ , calculated on the dried basis.

**USP Reference standards** (11)—

USP Betahistine Hydrochloride RS

**Identification—**

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**pH** (791): between 2.0 and 3.0, in a solution (1 in 10).

**Loss on drying** (731)—Dry it between 100° and 105° to constant weight: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Related compounds—**

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay*.

**Test solution**—Transfer about 38 mg of Betahistine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Procedure**—Inject about 10  $\mu$ L of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Betahistine Hydrochloride taken by the formula:

$$100F(r_i/r_s)$$

in which *F* is the response factor of the respective impurity (see *Table 1*) and 1.0 for all other peaks; *r<sub>i</sub>* is the peak response for each impurity; and *r<sub>s</sub>* is the sum of the responses of all of the peaks, adjusted for the relative response factor.

Table 1

Impurity Name	Relative Retention Time	Response Factor ( <i>F</i> )	Limit (%)
2-(2-Hydroxyethyl)pyridine	0.3	0.5	0.2
2-Vinylpyridine	0.4	0.4	0.2
<i>N</i> -Methyl- <i>N,N</i> -bis(2-pyridin-2-yl-ethyl)-amine	2.4	1.4	0.2

In addition to not exceeding the limits for impurities in *Table 1*, not more than 0.1% of any other individual impurity is found; and not more than 0.5 % of total impurities is found.

#### Assay—

**Ammonium acetate buffer**—Dissolve about 0.69 g of ammonium acetate in 1000 mL of water. Adjust with glacial acetic acid to a pH of 4.7.

**Mobile phase**—Prepare a filtered and degassed mixture of 350 mL of acetonitrile and 650 mL of *Ammonium acetate buffer*, containing 2.88 g of sodium lauryl sulfate. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Betahistine Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.38 mg per mL.

**Assay preparation**—Transfer about 38 mg of Betahistine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and 3.0-mm  $\times$  15-cm column that contains packing L1. The column temperature is maintained at 40°. The flow rate is about 0.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 5000 theoretical plates; the tailing factor for the betahistine peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_8H_{12}N_2 \cdot 2HCl$  in the portion of Betahistine Hydrochloride taken by the formula:

$$100C(r_u/r_s)$$

in which *C* is the concentration, in mg per mL, of USP Betahistine Hydrochloride RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betaine Hydrochloride

$C_5H_{11}NO_2 \cdot HCl$  153.61

Methanaminium, 1-carboxy-*N,N,N*-trimethyl-, chloride. Betaine hydrochloride.

(Carboxymethyl)trimethylammonium chloride [590-46-5].

» Betaine Hydrochloride contains not less than 98.0 percent and not more than 100.5 percent of  $C_5H_{11}NO_2 \cdot HCl$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—

USP Betaine Hydrochloride RS

#### Identification—

**A: Infrared Absorption** <197K>.

**B:** A solution (1 in 20) responds to the tests for *Chloride* <191>.

**pH** <791>: between 0.8 and 1.2, in a solution (1 in 4).

**Water, Method I** <921>: not more than 0.5%.

**Residue on ignition** <281>: not more than 0.1%.

**Heavy metals** <231>: 0.001%.

**Assay**—Transfer about 400 mg of Betaine Hydrochloride, accurately weighed, to a conical flask, add 50 mL of glacial acetic acid, and heat gently with swirling until solution is complete. Add 25 mL of mercuric acetate TS, cool, add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 15.36 mg of  $C_5H_{11}NO_2 \cdot HCl$ .

## Betamethasone

$C_{22}H_{29}FO_5$  392.46

Pregna-1,4-diene-3,20-dione, 9-fluoro-11,17,21-trihydroxy-16-methyl-, (11 $\beta$ ,16 $\beta$ )-.

9-Fluoro-11 $\beta$ ,17,21-trihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione [378-44-9].

» Betamethasone contains not less than 97.0 percent and not more than 103.0 percent of  $C_{22}H_{29}FO_5$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers. Store between 2° and 30°.

**USP Reference standards** <11>—

USP Betamethasone RS

#### Identification—

**A: Infrared Absorption** <197M>.

**B: Thin-Layer Chromatographic Identification Test** <201>—

**Test solution**—Prepare a solution of Betamethasone in dehydrated alcohol containing 0.5 mg per mL.

**Developing solvent system**: a mixture of chloroform and diethylamine (2:1).

**Procedure**—Proceed as directed in the chapter, except to locate the spots by lightly spraying with dilute sulfuric acid (1 in 2) and heating on a hot plate or under a lamp until spots appear.

**Specific rotation** (781S): between +118° and +126°, calculated on the dried basis.

**Test solution:** 5 mg per mL, in methanol.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%, a platinum crucible being used.

**Ordinary impurities** (466)—

**Test solution:** methanol.

**Standard solution:** methanol.

**Application volume:** 10  $\mu$ L.

**Eluant:** a mixture of toluene, acetone, methyl ethyl ketone, and formic acid (55:20:20:5), in a nonequilibrated chamber.

**Visualization:** 5.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of water and acetonitrile (63:37). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Prepare a solution of propylparaben in alcohol having a known concentration of about 0.25 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Betamethasone RS in alcohol to obtain a solution having a known concentration of about 0.2 mg per mL. Transfer 10.0 mL of this solution to a suitable vial, and add 10.0 mL of *Internal standard solution*, to obtain a *Standard preparation* having known concentrations of about 0.1 mg of betamethasone and about 0.125 mg of propylparaben per mL.

**Assay preparation**—Using about 80 mg of Betamethasone, accurately weighed, prepare as directed for *Standard preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for betamethasone and 1.4 for propylparaben; the resolution, *R*, between betamethasone and propylparaben is not less than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_5$  in the portion of Betamethasone taken by the formula:

$$800C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Betamethasone RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak height ratios of the betamethasone peak and the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Cream

» Betamethasone Cream contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of  $C_{22}H_{29}FO_5$  in a suitable cream base.

**Packaging and storage**—Preserve in collapsible tubes or in tight containers.

**USP Reference standards** (11)—

USP Betamethasone RS

**Thin-layer chromatographic identification test** (201)—

**Test solution:** 1 mg per mL, prepared by concentrating 10 mL of the *Assay preparation* on a steam bath to 1 mL.

**Standard solution**—Prepare a solution of USP Betamethasone RS in dehydrated alcohol having a concentration of 1 mg per mL.

**Developing solvent system:** a mixture of chloroform and diethylamine (2:1).

**Spray reagent:** a mixture of sulfuric acid, methanol, and nitric acid (10:10:1).

**Procedure**—Proceed as directed in the chapter, except to spray the plate with the *Spray reagent*, and heat at 105° for 10 minutes.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

**Assay**—

**Mobile phase**, **Internal standard solution**, **Standard preparation**, and **Chromatographic system**—Prepare as directed in the *Assay* under *Betamethasone*.

**Assay preparation**—Transfer an accurately weighed quantity of Cream, equivalent to about 2 mg of betamethasone, into a capped 50-mL centrifuge tube. Add 10.0 mL of *Internal standard solution* and 10.0 mL of alcohol. Mix by rotation for about 20 minutes. Centrifuge at 2500 rpm for about 10 minutes. Transfer a portion of the supernatant to a suitable vial.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_5$  in the portion of Cream taken by the formula:

$$20C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Betamethasone RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak height ratios of the betamethasone peak and the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Oral Solution

» Betamethasone Oral Solution contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ).

**Packaging and storage**—Store at controlled room temperature, protected from light. Preserve in a tight container.

**USP Reference standards** (11)—

USP Betamethasone RS

**Identification**—**A:**

**Test solution**—Place a volume of Oral Solution equivalent to about 1 mg of betamethasone in a centrifuge tube. Add 15 mL of 0.1 N hydrochloric acid and 20 mL of ethyl acetate. Shake the tube for about 1 minute. Centrifuge to separate the phases. Transfer the upper phase (ethyl acetate) to a suitable container. Evaporate it to dryness on a steam bath under a gentle stream of nitrogen.

Allow to cool to room temperature. Dissolve the residue in about 0.5 mL of chloroform and methanol (1:1), using a vortex mixer. Transfer the solution to a 2-mL volumetric flask with small portions of a mixture of chloroform and methanol (1:1), dilute with the mixture of chloroform and methanol (1:1) to volume, and mix.

Evaporate 1 mL of the resulting solution on a steam bath just to dryness, and dissolve the residue in 0.5 mL of alcohol.

**Standard solution**—Prepare a solution of USP Betamethasone RS in alcohol having a concentration of about 1 mg betamethasone per mL.

**Developing solvent system:** a mixture of chloroform and diethylamine (2:1).

**Procedure**—Proceed as directed in the chapter. Locate the spots by lightly spraying with dilute sulfuric acid (1 in 2); heat on a hot plate or under a lamp until spots appear.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Microbial limits** (61)—The total aerobic microbial count does not exceed 100 cfu per mL, and the total combined molds and yeasts count does not exceed 10 cfu per mL. It meets the requirements of the test for absence of *Escherichia coli*.

**pH** (791): between 2.8 and 3.6.

**Deliverable volume** (698)—For Oral Solution packaged in multiple-unit containers: meets the requirements.

**Related compounds**—[NOTE—Protect all standard and test solutions from light.]

*Diluent, Buffer, Solution A, Solution B, Mobile phase, Standard stock preparation, System suitability preparation, and Assay preparation*—Prepare as directed in the *Assay*.

**Standard solution**—Quantitatively dilute with *Diluent* an aliquot of the *Standard stock preparation*, as prepared in the *Assay*, to obtain a solution having a known concentration of about 0.48 µg per mL.

**Quantitative limit solution**—Quantitatively dilute with *Diluent* an aliquot of the *Standard solution* to obtain a solution having a known concentration of about 0.024 µg per mL.

**Test solution**—Prepare as directed for the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—Proceed as directed in the *Assay*. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for betamethasone and 1.2 for beclomethasone; the resolution, *R*, between betamethasone and beclomethasone is not less than 4.0; and the relative standard deviation of the betamethasone peak for replicate injections of the *Quantitative limit solution* is not more than 10%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard solution*, the *Quantitative limit solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses for the betamethasone related compounds listed in *Table 1* and for betamethasone. Calculate the percentage of each related

compound in the portion of Oral solution taken by the formula:

$$100(C_S / C_T)(r_i / r_S)$$

in which *C<sub>S</sub>* is the concentration, in mg per mL, of betamethasone in the *Standard solution*; *C<sub>T</sub>* is the concentration, in mg per mL, of betamethasone in the *Test solution*, based on the label claim; *r<sub>i</sub>* is the peak area response for each related compound obtained from the *Test solution*; and *r<sub>S</sub>* is the peak area response of the betamethasone peak obtained from the *Standard solution*. The limits are as specified in *Table 1*.

**Table 1**

Related Compound	Relative Retention Time	Limit (%)
Betamethasone	1.0	—
9,11-Expoxy-17α,21-dihydroxy-16β-methylpregna-1,4 diene-3,20-dione	1.25	1.3
17α,21-Dihydroxy-16β-methylpregna-1,4,11-triene-3,20-dione	1.33	0.7

**Assay**—[NOTE—Protect all standard and assay preparations from light.]

**Diluent**—Prepare a mixture of water and dehydrated alcohol (3:2).

**Buffer**—Accurately weigh 6.8 g of monobasic potassium phosphate, and transfer to a 1-L flask. Add 1 L of water, and mix until completely dissolved. Adjust with phosphoric acid to a pH of 2.9, and mix.

**Solution A**—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (75:25).

**Solution B**—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (55:45).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard stock preparation**—Dissolve an accurately weighed quantity of USP Betamethasone RS in dehydrated alcohol, and sonicate until completely dissolved to obtain a solution having a known concentration of about 0.3 mg per mL. Quantitatively dilute with water an aliquot of the solution to obtain a solution having a known concentration of about 0.12 mg per mL.

**System suitability preparation**—Dissolve an accurately weighed quantity of beclomethasone in dehydrated alcohol, and sonicate until completely dissolved to obtain a solution having a concentration of about 0.3 mg per mL. Quantitatively dilute with water an aliquot to obtain a solution having a known concentration of about 0.12 mg per mL. Pipet 10.0 mL of this solution and 10.0 mL of the *Standard stock preparation* into a 25-mL volumetric flask, and dilute with *Diluent* to volume.

**Standard preparation**—Quantitatively dilute with *Diluent* an aliquot of the *Standard stock preparation* to obtain a solution having a known concentration of about 0.048 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 1.2 mg of betamethasone, to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 4-µm packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–25.0	100→0	0→100	linear gradient
25.0–25.1	0→100	100→0	linear gradient
25.1–35.0	100	0	re-equilibration

Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for betamethasone and 1.2 for beclomethasone; the resolution,  $R$ , between betamethasone and beclomethasone is not less than 4.0; the tailing factor of the betamethasone peak is not more than 1.5; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area responses for the betamethasone peaks. Calculate the content of betamethasone ( $C_{22}H_{29}FO_5$ ) as a percentage of the labeled content of betamethasone in the Oral Solution taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of betamethasone in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of betamethasone in the *Assay preparation*, based on the label claim; and  $r_U$  and  $r_S$  are the peak area responses of the betamethasone peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Tablets

» Betamethasone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ).

**Packaging and storage**—Preserve in tight containers. Store between 2° and 25°, excursions permitted between 15° and 30°. [NOTE—Protect the 21-tablet pack from excessive moisture.]

**USP Reference standards** (11)—  
USP Betamethasone RS

**Identification**—Evaporate 50 mL of the *Assay preparation*, prepared as directed in the *Assay*, on a steam bath just to dryness, and dissolve the residue in 1 mL of chloroform. Proceed as directed for *Identification test B* under *Betamethasone*, beginning with “Apply 10  $\mu$ L of this solution.”

**Dissolution**, *Procedure for a Pooled Sample* (711)—

**Medium**: water; 900 mL. Add 1.0 mL of *Internal standard solution* to each vessel.

**Apparatus 2**: 50 rpm.

**Time**: 45 minutes.

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (60:40), making adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Prepare a solution in methanol of testosterone having a final concentration of about 0.5 mg per mL.

**Standard solution**—Prepare a solution of USP Betamethasone RS, in methanol, having an accurately known concentration of about 0.5 mg per mL. Pipet 1 mL of this solution and 1 mL of the *Internal standard solution* into a container, and quantitatively dilute with water to 900 mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph replicate injections of the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between betamethasone and testosterone is not less than 1.5; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 200  $\mu$ L) of the *Standard solution* and filtered portions of the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for betamethasone and 1.0 for testosterone. Calculate the quantity of  $C_{22}H_{29}FO_5$  dissolved in comparison with the *Standard solution*, similarly chromatographed.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{22}H_{29}FO_5$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—

**Standard preparation**—Prepare as directed under *Assay for Steroids* (351), using USP Betamethasone RS, to obtain a solution having a known concentration of about 12  $\mu$ g per mL instead of 10  $\mu$ g per mL.

**Test preparation**—Weigh and finely powder 1 Tablet. Transfer to a 125-mL separator, add 20 mL of water, and shake. Extract the betamethasone completely, using three 15-mL portions of chloroform, filtering each extract through chloroform-washed cotton into a 50-mL volumetric flask. Dilute with chloroform to volume, and mix. Transfer 20.0 mL of this solution to a glass-stoppered, 50-mL conical flask, evaporate the chloroform on a steam bath just to dryness, cool, and dissolve the residue in 20.0 mL of alcohol.

**Procedure**—Proceed as directed under *Assay for Steroids* (351), except to keep the flasks in a constant-temperature bath at  $45 \pm 1^\circ$  for 90 minutes, then add 1.0 mL of glacial acetic acid, and cool. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_5$  in the Tablet by the formula:

$$(TC/D)(A_U / A_S)$$

in which  $T$  is the labeled quantity, in mg, of betamethasone in the Tablet;  $C$  is the concentration, in  $\mu$ g per mL, of USP Betamethasone RS in the *Standard preparation*;  $D$  is the concentration, in  $\mu$ g per mL, of betamethasone in the *Test preparation*, based upon the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of water and acetonitrile (2:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer about 25 mg of beclomethasone to a 200-mL volumetric flask, add methanol to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Betamethasone RS in methanol, and dilute quantitatively and stepwise, if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL. Mix equal volumes, accurately measured, of this solution and the *Internal standard solution* to obtain a *Standard preparation* having a final known concentration of about 0.05 mg of USP Betamethasone RS per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 0.5 mg of betamethasone, to a 125-mL separator. Add 25 mL of water, and shake by mechanical means for about 15 minutes. Add 5.0 mL of *Internal standard solution*. Extract with four 25-mL portions of

chloroform. Filter the chloroform extracts through about 4 g of chloroform-washed anhydrous sodium sulfate, collecting the extracts in a 150-mL beaker. Evaporate the extracts on a steam bath with the aid of a stream of nitrogen to dryness, taking care to avoid overheating. Dissolve the residue in 2 mL of methanol, and transfer to a 10-mL volumetric flask. Rinse the beaker with small portions of methanol, transferring the rinses to the same flask. Dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation*, and record the peak heights as directed for *Procedure*: the resolution,  $R$ , between the analyte and internal standard peaks is not less than 1.7; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the heights of the major peaks. The relative retention times are about 1.4 for beclomethasone and 1.0 for betamethasone. Calculate the quantity, in mg, of betamethasone ( $C_{22}H_{29}FO_5$ ) in the portion of Tablets taken by the formula:

$$10C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Betamethasone RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak height ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Acetate

$C_{24}H_{31}FO_6$  434.50

Pregna-1,4-diene-3,20-dione, 9-fluoro-11,17-dihydroxy-16-methyl-21-(acetyloxy)-, (11 $\beta$ ,16 $\beta$ )-.

9-Fluoro-11 $\beta$ ,17,21-trihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione 21-acetate [987-24-6].

» Betamethasone Acetate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{24}H_{31}FO_6$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers. Store between 2° and 30°.

**USP Reference standards** <11>—

USP Betamethasone Acetate RS

**Identification**—

**A:** Infrared Absorption <197M>.

**B:** Thin-Layer Chromatographic Identification Test <201>—

*Test solution:* 0.5 mg per mL in dehydrated alcohol.

*Developing solvent system:* a mixture of chloroform and diethylamine (2:1).

**Procedure**—Proceed as directed in the chapter. Locate the spots on the plate by lightly spraying with 10% sulfuric acid in alcohol and heating on a hot plate or under a lamp until spots appear.

**Specific rotation** <781S>: between +120° and +128°.

*Test solution:* 10 mg per mL, in dioxane.

**Water, Method I** <921>: not more than 4.0%.

**Residue on ignition** <281>: not more than 0.2%, a platinum crucible being used.

**Ordinary impurities** <466>—

*Test solution:* methanol.

*Standard solution:* methanol.

*Application volume:* 10  $\mu$ L.

*Eluant:* a mixture of toluene and isopropyl alcohol (90:10), in a nonequilibrated chamber.

*Visualization:* 5.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (800:700:1.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Internal standard solution**—Transfer about 35 mg of progesterone to a 50-mL volumetric flask, add *Mobile phase* to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Betamethasone Acetate RS in *Mobile phase*, and quantitatively dilute with *Mobile phase* to obtain a solution containing about 0.5 mg per mL. Transfer 10.0 mL of the resulting solution to a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix to obtain a solution having a known concentration of about 0.1 mg of USP Betamethasone Acetate RS per mL.

**Assay preparation**—Transfer about 50 mg of Betamethasone Acetate, accurately weighed, to a 100-mL volumetric flask, add *Mobile phase* to volume, and mix. Transfer 10.0 mL of the resulting solution to a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 3 for progesterone and 1.0 for betamethasone acetate; the resolution,  $R$ , between the analyte and internal standard peaks is not less than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{24}H_{31}FO_6$  in the portion of Betamethasone Acetate taken by the formula:

$$500C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Betamethasone Acetate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Benzoate

$C_{29}H_{33}FO_6$  496.57

Pregna-1,4-diene-3,20-dione, 17-(benzoyloxy)-9-fluoro-11,21-dihydroxy-16-methyl-, (11 $\beta$ ,16 $\beta$ )-.

9-Fluoro-11 $\beta$ ,17,21-trihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione 17-benzoate [22298-29-9].

» Betamethasone Benzoate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{29}H_{33}FO_6$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers. Store between 2° and 30°.

**USP Reference standards** <11>—

USP Betamethasone Benzoate RS

**Identification, Infrared Absorption** (197M).

**Specific rotation** (781S): between +60° and +66°.

*Test solution:* 40 mg per mL, in dioxane.

**Loss on drying** (731)—Dry about 200 mg, accurately weighed, at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Related steroids—**

*Adsorbent:* 0.25-mm layer of chromatographic silica gel mixture.

*Test solution—*Dissolve 100.0 mg in 5.0 mL of methanol.

*Standard solution 1—*Dissolve a suitable quantity of USP Betamethasone Benzoate RS in methanol to obtain a solution having a known concentration of about 5 mg per mL.

*Standard solution 2—*Dilute a portion of *Standard solution 1*, quantitatively and stepwise, with methanol to obtain a solution having a known concentration of about 100 µg per mL.

*Application volume:* 10 µL.

*Developing solvent system:* a mixture of toluene, acetone, and methanol (75:25:4).

*Procedure—*Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Examine the plate under short-wavelength UV light: the principal spot from the *Test solution* corresponds in  $R_f$  value to that of *Standard solution 1*; and the *Test solution* shows not more than 3 additional spots, the intensity and size of which do not exceed those of the spot from *Standard solution 2*.

**Assay—**

*Mobile phase—*Prepare a suitable filtered solution of acetonitrile and water (60:40).

*Internal standard solution—*Prepare a solution of betamethasone dipropionate in methanol containing 0.6 mg per mL.

*Standard preparation—*Using an accurately weighed quantity of USP Betamethasone Benzoate RS, prepare a solution in methanol having a known concentration of about 0.6 mg per mL. Mix 5.0 mL of this solution and 10.0 mL of the *Internal standard solution* to obtain a *Standard preparation* having a known concentration of about 0.2 mg of betamethasone benzoate per mL.

*Assay preparation—*Transfer about 60 mg of Betamethasone Benzoate, accurately weighed, to a 100-mL volumetric flask. Dilute with methanol to volume, and mix. Mix 5.0 mL of this solution and 10.0 mL of the *Internal standard solution*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph three replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%; and the resolution factor between betamethasone benzoate and the internal standard is not less than 3.

*Procedure—*Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks. The retention times are about 7 and 5 minutes for betamethasone dipropionate and betamethasone benzoate, respectively. Calculate the quantity, in mg, of  $C_{29}H_{33}FO_6$  in the portion of Betamethasone Benzoate taken by the formula:

$$300C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Betamethasone Benzoate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the betamethasone benzoate peak and the internal standard

peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Benzoate Gel

» Betamethasone Benzoate Gel contains an amount of betamethasone benzoate ( $C_{29}H_{33}FO_6$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone benzoate ( $C_{29}H_{33}FO_6$ ).

**Packaging and storage—**Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°. Protect from freezing.

**USP Reference standards** (11)—

USP Betamethasone Benzoate RS

USP Methyltestosterone RS

**Identification—**The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

**Assay—**

*Mobile phase—*Prepare a filtered and degassed mixture of methanol, water, and acetonitrile (23:18:9). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution—*Dissolve suitable quantities of USP Methyltestosterone RS in methanol to obtain a solution containing about 250 µg per mL.

*Standard preparation—*Dissolve an accurately weighed quantity of USP Betamethasone Benzoate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.5 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix.

*Assay preparation—*Transfer an accurately weighed portion of Gel, equivalent to about 0.5 mg of betamethasone benzoate, to a 125-mL separatory funnel, add 20 mL of water and 2 mL of saturated sodium acetate solution, shake to disperse the Gel, add 2.0 mL of *Internal standard solution*, and mix. Extract this solution with one 50-mL portion of chloroform followed by three 40-mL portions of chloroform. Discard the aqueous layer. Wash the chloroform extract with 10 mL of water, allow to stand for 10 minutes, then pass through chloroform-wetted glass fiber filter paper and anhydrous sodium sulfate into a suitable container. Evaporate to dryness under vacuum at 30°. Dissolve the residue in 10 mL of methanol.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 236-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 30°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.33 for betamethasone benzoate and 1.0 for methyltestosterone; the resolution,  $R$ , between methyltestosterone and betamethasone benzoate is not less than 3.0; and the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure—*Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into

the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of betamethasone benzoate ( $C_{29}H_{33}FO_6$ ) in the portion of Gel taken by the formula:

$$0.01C(R_U / R_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Betamethasone Benzoate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses obtained for betamethasone benzoate and methyltestosterone from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Dipropionate

$C_{28}H_{37}FO_7$  504.59

Pregna-1,4-diene-3,20-dione, 9-fluoro-11-hydroxy-16-methyl-17,21-bis(1-oxopropoxy)-, (11 $\beta$ ,16 $\beta$ ).  
9-Fluoro-11 $\beta$ ,17,21-trihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione 17,21-dipropionate [5593-20-4].

» Betamethasone Dipropionate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{28}H_{37}FO_7$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

### USP Reference standards (11)—

USP Beclomethasone Dipropionate RS

USP Betamethasone Dipropionate RS

USP Betamethasone Valerate RS

### Identification—

**A:** *Infrared Absorption* (197M).

**B:** *Thin-Layer Chromatographic Identification Test* (201)—

*Test solution:* 1 mg per mL, in chloroform.

*Developing solvent system:* a mixture of chloroform and acetone (7:1).

**Specific rotation** (781S): between +63° and +70°.

*Test solution:* 10 mg per mL, in dioxane.

**Loss on drying** (731): Dry it at 105° for 3 hours; it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%, a platinum crucible being used.

### Chromatographic purity—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and water (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve accurately weighed quantities of USP Betamethasone Dipropionate RS and USP Betamethasone Valerate RS in *Mobile phase* to obtain a solution having final concentrations of about 0.05 mg of each per mL.

*Test solution*—Transfer about 3 mg of Betamethasone Dipropionate, accurately weighed, to a suitable flask. Add 10 mL of *Mobile phase*, and shake until dissolved.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the

*System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between betamethasone valerate and betamethasone dipropionate is not less than 4.0; and the column efficiency is not less than 8000 theoretical plates.

*Procedure*—Inject a volume (about 10  $\mu\text{L}$ ) of the *Test solution* into the chromatograph, record the chromatogram, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Betamethasone Dipropionate taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses for all the peaks: not more than 1.0% of any individual impurity is found; and not more than 2.0% of total impurities is found.

### Assay—

*Mobile phase*—Prepare a suitable acetonitrile solution (about 1 in 2), degassed by ultrasonic vibration for 5 to 10 minutes, such that the retention time of betamethasone dipropionate is approximately 14 minutes and that of beclomethasone dipropionate is approximately 18 minutes. [NOTE—Do not leave the mobile phase in the column overnight, but flush the system after use with water for 15 minutes, followed by methanol for 15 minutes.]

*Internal standard solution*—Prepare a solution of USP Beclomethasone Dipropionate RS in a solution of acetic acid in methanol (1 in 1000) having a known concentration of about 0.9 mg per mL.

*Standard preparation*—Prepare a solution of USP Betamethasone Dipropionate RS in a solution of acetic acid in methanol (1 in 1000) having a known concentration of about 0.6 mg per mL. Transfer 5.0 mL of this solution to a suitable vial, and add 5.0 mL of *Internal standard solution* to obtain a solution having known concentrations of about 0.3 mg of betamethasone dipropionate and about 0.45 mg of beclomethasone dipropionate per mL.

*Assay preparation*—Accurately weigh about 60 mg of Betamethasone Dipropionate. Dilute quantitatively and stepwise with a solution of acetic acid in methanol (1 in 1000) to obtain a solution containing about 0.6 mg per mL. Transfer 5.0 mL of this solution to a suitable vial, and add 5.0 mL of *Internal standard solution*.

*Procedure*—Separately inject equal volumes (between 5  $\mu\text{L}$  and 25  $\mu\text{L}$ ) of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph (see *Chromatography* (621)) operated at room temperature, by means of a suitable microsyringe or sampling valve, adjusting the specimen size and other operating parameters such that the peak obtained from the internal standard in the *Standard preparation* is about 0.6 full-scale. Typically, the apparatus is fitted with a 4-mm  $\times$  30-cm column that contains packing L1, and is equipped with a UV detector capable of monitoring absorption at 254 nm or 240 nm and a suitable recorder, and is capable of operating at a column pressure of up to 3500 psi. In a suitable chromatogram, the lowest and highest peak area ratios ( $R_s$ ) of three successive injections of the *Standard preparation* agree within 2.0%. Determine the ratio of the peak heights, at equivalent retention times, obtained with the *Assay preparation* and the *Standard preparation*, and calculate the quantity, in mg, of  $C_{28}H_{37}FO_7$  in the portion of Betamethasone Dipropionate taken by the formula:

$$200C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Betamethasone Dipropionate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak height ratios of betamethasone dipropionate to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Dipropionate Topical Aerosol

» Betamethasone Dipropionate Topical Aerosol is a solution, in suitable propellants in a pressurized container, of betamethasone dipropionate ( $C_{28}H_{37}FO_7$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ).

**Packaging and storage**—Preserve in tight, pressurized containers, and avoid exposure to excessive heat. Store at 25°, excursions permitted between 15° and 30°.

### USP Reference standards (11)—

USP Beclomethasone Dipropionate RS

USP Betamethasone Dipropionate RS

### Thin-layer chromatographic identification test (201)—

**Test solution**—Place the container in a dry ice-methanol bath for about 5 minutes. Open the can by means of a tube-cutter, and allow the propellant to evaporate under a gentle stream of nitrogen for about 1 hour. Transfer about 3 mL of the residue to a 50-mL centrifuge tube. Add 10 mL of a mixture of methanol and water (4:1), and shake vigorously. Centrifuge to clarify.

**Standard solution**: USP Betamethasone Dipropionate RS in methanol containing 3.2 mg per mL.

**Application volume**: 25  $\mu$ L.

**Developing solvent system**: a mixture of toluene and ethyl acetate (1:1).

**Procedure**—Proceed as directed in the chapter. Spray the plate with a mixture of sulfuric acid, methanol, and nitric acid (10:10:1), and heat at 105° for 15 minutes.

**Other requirements**—It meets the requirements for *Pressure Test*, *Minimum Fill*, and *Leakage Test* under *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* (601).

### Assay—

**Mobile phase**—Prepare as directed for *Mobile phase* in the *Assay* under *Betamethasone Dipropionate*.

**Internal standard solution**—Prepare a solution of USP Beclomethasone Dipropionate RS, having a known concentration of about 0.90 mg per mL, in isopropyl alcohol containing glacial acetic acid (1 in 1000).

**Standard preparation**—Prepare a solution of USP Betamethasone Dipropionate RS, having a known concentration of about 0.642 mg per mL, in isopropyl alcohol containing acetic acid (1 in 1000). Transfer 10.0 mL of this solution and 10.0 mL of *Internal standard solution* to a 100-mL volumetric flask, add isopropyl alcohol containing acetic acid (1 in 1000) to volume, and mix, to obtain a solution having known concentrations of about 0.09 mg of beclomethasone dipropionate and about 0.0642 mg of betamethasone dipropionate per mL.

**Assay preparation**—Discharge the entire contents of the container of Topical Aerosol into a 100-mL volumetric flask. Allow the solution to warm to room temperature slowly to prevent it from boiling out of the flask, then evaporate the propellant by swirling the flask in a water bath at about 25° until the solution stops bubbling. Add 10.0 mL of *Internal standard solution*, and dilute with glacial acetic acid in isopropyl alcohol (1 in 1000) to volume. Pass the solution through a 0.45- $\mu$ m filter.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Betamethasone Dipropionate*. Calculate the quantity, in mg, of betamethasone ( $C_{22}H_{29}FO_5$ ) equivalent to the quan-

tity of betamethasone dipropionate ( $C_{28}H_{37}FO_7$ ) in the container of the Topical Aerosol taken by the formula:

$$(392.46/504.60)(100C)(R_U / R_S)$$

in which 392.46 and 504.60 are the molecular weights of betamethasone and betamethasone dipropionate, respectively; C is the concentration, in mg per mL, of USP Betamethasone Dipropionate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak height ratios of the betamethasone dipropionate and beclomethasone dipropionate peaks in the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Dipropionate Cream

» Betamethasone Dipropionate Cream contains an amount of betamethasone dipropionate ( $C_{28}H_{37}FO_7$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ), in a suitable cream base.

**Packaging and storage**—Preserve in collapsible tubes or tight containers. Store at 25°, excursions permitted between 15° and 30°. Protect from freezing.

### USP Reference standards (11)—

USP Beclomethasone Dipropionate RS

USP Betamethasone Dipropionate RS

### Thin-layer chromatographic identification test (201)—

**Test solution**—Transfer about 1.5 g of Cream to a glass-stoppered, 50-mL centrifuge tube. Add 15 mL of a methanol-hydrochloric acid solution prepared by mixing 1 volume of dilute hydrochloric acid (1 in 120) with 4 volumes of methanol. Shake to obtain a homogeneous mixture. Add 30 mL of solvent hexane, mix for 10 minutes, and centrifuge. Using a suitable syringe, transfer the lower aqueous phase to a second centrifuge tube, add about 20 mL of water, and mix. Extract this aqueous mixture with chloroform by shaking, centrifuging, and removing the lower, chloroform phase with a syringe. Evaporate the chloroform on a steam bath with the aid of a stream of nitrogen to dryness, cool, and dissolve the residue in chloroform to obtain a solution containing about 150  $\mu$ g of betamethasone dipropionate per mL.

**Standard solution**: USP Betamethasone Dipropionate RS in chloroform containing 150  $\mu$ g per mL.

**Application volume**: 40  $\mu$ L.

**Developing solvent system**: a mixture of chloroform and acetone (7:1).

**Procedure**—Proceed as directed in the chapter.

**Minimum fill** (755): meets the requirements.

### Assay—

**Mobile phase**—Prepare as directed in the *Assay* under *Betamethasone Dipropionate*.

**Internal standard solution**—Prepare a solution of USP Beclomethasone Dipropionate RS in methanol containing acetic acid (1 in 1000) having a known concentration of about 0.45 mg per mL.

**Standard preparation**—Prepare a solution of USP Betamethasone Dipropionate RS in methanol containing acetic acid (1 in 1000) having a known concentration of about 0.2 mg per mL. Transfer 10.0 mL of this solution to a suitable vial, and add 5.0 mL of *Internal standard solution*, to obtain a *Standard preparation* having known concentrations

of about 0.133 mg of betamethasone dipropionate and about 0.15 mg of beclomethasone dipropionate per mL.

**Assay preparation**—Transfer an accurately weighed quantity of Cream, equivalent to about 2 mg of betamethasone dipropionate, into a capped 50-mL centrifuge tube. Add 5.0 mL of *Internal standard solution* and 10.0 mL of methanol containing acetic acid (1 in 1000). Heat in a water bath at 60°, shaking intermittently, until the assay specimen melts. Remove from the bath, and shake vigorously until the specimen has resolidified. Repeat the heating and shaking. Freeze in an ice-methanol bath for about 15 minutes, and centrifuge at 2500 rpm for about 5 minutes. Transfer a portion of the supernatant to a suitable vial.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Betamethasone Dipropionate*. Calculate the quantity, in mg, of betamethasone ( $C_{22}H_{29}FO_5$ ) in the portion of Cream taken by the formula:

$$(392.46/504.60)(15C)(R_U / R_S)$$

in which 392.46 and 504.60 are the molecular weights of betamethasone and betamethasone dipropionate, respectively; C is the concentration, in mg per mL, of USP Betamethasone Dipropionate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak height ratios of the betamethasone dipropionate peak and the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Dipropionate Lotion

» Betamethasone Dipropionate Lotion contains an amount of betamethasone dipropionate ( $C_{28}H_{37}FO_7$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ), in a suitable lotion base.

**Packaging and storage**—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°. Protect from light and freezing.

**USP Reference standards** (11)—  
USP Beclomethasone Dipropionate RS  
USP Betamethasone Dipropionate RS

**Thin-layer chromatographic identification test** (201)—

**Test solution**—Transfer a quantity of Lotion, equivalent to about 0.6 mg of betamethasone dipropionate, to a 50-mL vial. Add 10 mL of 0.1 N hydrochloric acid, then add 4 mL of chloroform. Disperse on a vortex mixer for about 1 minute, then shake vigorously for 10 minutes, and centrifuge at 2000 rpm for about 5 minutes. Transfer the chloroform layer to a suitable vial.

**Standard solution**: USP Betamethasone Dipropionate RS in chloroform containing 150 µg per mL.

**Application volume**: 40 µL.

**Developing solvent system**: a mixture of chloroform and acetone (7:1).

**Procedure**—Proceed as directed in the chapter.

**Minimum fill** (755): meets the requirements.

**Assay**—

**Mobile phase and Chromatographic system**—Prepare as directed in the *Assay* under *Betamethasone Dipropionate*.

**Internal standard solution**—Prepare as directed in the *Assay* under *Betamethasone Dipropionate*, except to use chloroform as the solvent.

**Standard preparation**—Prepare as directed in the *Assay* under *Betamethasone Dipropionate*, except to use chloroform as the solvent. To 10.0 mL of 0.1 N hydrochloric acid in a capped 5-mL centrifuge tube add 4.0 mL of the prepared solution, and treat this solution as follows. Cap, and shake vigorously for about 2 minutes, or disperse on a vortex mixer for about 1 minute. Centrifuge at 2500 rpm for about 3 minutes. Transfer the chloroform phase to a suitable vial. Evaporate the chloroform under a stream of nitrogen at a slightly elevated temperature to dryness. Cool the vial to room temperature, add 4.0 mL of methanol, and swirl to dissolve the residue.

**Assay preparation**—Transfer an accurately weighed quantity of Lotion, equivalent to about 1.2 mg of betamethasone dipropionate, to a capped 50-mL centrifuge tube. Add 10.0 mL of 0.1 N hydrochloric acid, shake to disperse, then add 2.0 mL of *Internal standard solution* and 2.0 mL of chloroform. Proceed as directed for *Standard preparation* beginning with "Cap, and shake."

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Betamethasone Dipropionate*. Calculate the quantity, in mg, of betamethasone ( $C_{22}H_{29}FO_5$ ) in the portion of Lotion taken by the formula:

$$(392.46/504.60)(4C)(R_U / R_S)$$

in which 392.46 and 504.60 are the molecular weights of betamethasone and betamethasone dipropionate, respectively; C is the concentration, in mg per mL, of USP Betamethasone Dipropionate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak height ratios of the betamethasone dipropionate peak and the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Dipropionate Ointment

» Betamethasone Dipropionate Ointment contains an amount of betamethasone dipropionate ( $C_{28}H_{37}FO_7$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ), in a suitable ointment base.

**Packaging and storage**—Preserve in collapsible tubes or tight containers. Store at 25°, excursions permitted between 15° and 30°. Protect from freezing.

**USP Reference standards** (11)—  
USP Beclomethasone Dipropionate RS  
USP Betamethasone Dipropionate RS

**Thin-layer chromatographic identification test** (201)—

**Test solution**—Transfer about 1.5 g of Ointment to a glass-stoppered, 50-mL centrifuge tube. Add 15 mL of methanol-hydrochloric acid solution prepared by mixing 1 volume of dilute hydrochloric acid (1 in 120) with 4 volumes of methanol. Shake to obtain a homogeneous mixture. Add 30 mL of solvent hexane, mix for 10 minutes, and centrifuge. Using a suitable syringe, transfer the lower aqueous phase to a second centrifuge tube, add about 20 mL of water, and mix. Extract this aqueous mixture with chloroform by shaking, centrifuging, and removing the lower, chloroform phase with a syringe. Evaporate the chloroform on a steam bath with the aid of a stream of nitrogen to dryness, cool, and dissolve the residue in chloroform to obtain a solution containing about 150 µg of betamethasone dipropionate per mL.

**Standard solution**: USP Betamethasone Dipropionate RS in chloroform containing 150 µg per mL.

*Application volume:* 40  $\mu$ L.

*Developing solvent system:* a mixture of chloroform and acetone (7:1).

*Procedure*—Proceed as directed in the chapter.

**Minimum fill** (755): meets the requirements.

#### Assay—

*Mobile phase*—Prepare as directed in the Assay under *Betamethasone Dipropionate*.

*Internal standard solution and Standard preparation*—Prepare as directed in the Assay under *Betamethasone Dipropionate Cream*, except to use alcohol containing acetic acid (1 in 1000) as the solvent.

*Assay preparation*—Transfer an accurately weighed quantity of Ointment, equivalent to about 2 mg of betamethasone dipropionate, to a capped 50-mL centrifuge tube. Add 5.0 mL of *Internal standard solution* and 10.0 mL of alcohol containing acetic acid (1 in 1000). Heat in a water bath at 70°, shaking intermittently until the assay specimen melts. Remove from the bath, and shake vigorously until the ointment has solidified. Repeat the heating and shaking operation. Proceed as directed for *Assay preparation* in the Assay under *Betamethasone Dipropionate Cream*, beginning with "Freeze in an ice-methanol bath."

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Betamethasone Dipropionate Cream*.

### Betamethasone Sodium Phosphate

$C_{22}H_{28}FNa_2O_8P$  516.40

Pregna-1,4-diene-3,20-dione, 9-fluoro-11,17-dihydroxy-16-methyl-21-(phosphonoxy)-, disodium salt, (11 $\beta$ ,16 $\beta$ )-9-Fluoro-11 $\beta$ ,17,21-trihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione 21-(disodium phosphate) [151-73-5].

» Betamethasone Sodium Phosphate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{22}H_{28}FNa_2O_8P$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Betamethasone Sodium Phosphate RS

#### Identification—

**A:** *Infrared Absorption* (197M).

**B:** *Thin-Layer Chromatographic Identification Test* (201)—

*Test solution:* 1 mg per mL.

*Standard solution*—Prepare a solution of USP Betamethasone Sodium Phosphate RS in methanol having a concentration of 1 mg per mL.

*Developing solvent system*—Place 500 mL of butyl alcohol and 200 mL of dilute hydrochloric acid (1 in 12) in a separatory funnel, and mix. Use the organic layer as the developing solvent.

*Spray reagent:* a mixture of sulfuric acid, methanol, and nitric acid (10:10:1).

*Procedure*—Proceed as directed in the chapter except to spray the plate with *Spray reagent*, and heat at 105° for 10 minutes.

**C:** Ignite it at 800° (see *Residue on Ignition* (281)): the residue responds to the tests for *Sodium* (191) and for *Phosphate* (191).

**Specific rotation** (781S): between +99° and +105°.

*Test solution:* 10 mg per mL, in water.

**Water, Method I** (921): not more than 10.0%.

#### Limit of phosphate ions—

*Standard Phosphate Solution and Phosphate reagent A*—Prepare as directed under *Phosphate in reagents* (see *General Tests for Reagents under Reagents, Indicators, and Solutions*).

*Phosphate reagent B*—Dissolve 350 mg of *p*-methylaminophenol sulfate in 50 mL of water, add 20 g of sodium metabisulfite, mix to dissolve, and dilute with water to 100 mL.

*Procedure*—Dissolve about 50 mg of Betamethasone Sodium Phosphate, accurately weighed, in a mixture of 10 mL of water and 5 mL of 2 N sulfuric acid contained in a 25-mL volumetric flask, by warming if necessary. Add 1 mL each of *Phosphate reagent A* and *Phosphate reagent B*, dilute with water to 25.0 mL, mix, and allow to stand at room temperature for 30 minutes. Similarly and concomitantly prepare a Standard solution, using 5.0 mL of *Standard Phosphate Solution* instead of the 50 mg of the substance under test. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 730 nm, with a suitable spectrophotometer, using water as the blank. The absorbance of the test solution is not more than that of the Standard solution. The limit is 1.0% of phosphate ( $PO_4$ ).

#### Limit of free betamethasone—

*Test solution*—Dissolve 25.0 mg of Betamethasone Sodium Phosphate in water to make 25.0 mL. Transfer 5.0 mL of the solution to a separator, and extract with three 25-mL portions of chloroform. Filter each extract through a chloroform-saturated cotton pledget, combining the filtrates in a conical flask. Evaporate the chloroform on a steam bath with the aid of a current of air to dryness, and dissolve the residue in methanol to make 25.0 mL.

*Blank solution*—Transfer 5.0 mL of water to a separator, and proceed as directed under *Test solution*. The methanolic solution so obtained is the *Blank solution*.

*Procedure*—Determine the absorbance (*A*) of the *Test solution* in a 1-cm cell at the wavelength of maximum absorbance at about 239 nm, with a suitable spectrophotometer, using *Blank solution* as the blank. Calculate the quantity, in mg, of free betamethasone in the portion of Betamethasone Sodium Phosphate taken by the formula:

$$3.125A.$$

The limit is 250  $\mu$ g (1.0%).

#### Assay—

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and 0.07 M anhydrous monobasic potassium phosphate (3:2). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Betamethasone Sodium Phosphate RS in a mixture of methanol and water (3:2), and dilute quantitatively, and stepwise if necessary, with the same mixture of methanol and water to obtain a solution having a known concentration of about 0.17 mg per mL.

*Assay preparation*—Transfer about 34 mg of Betamethasone Sodium Phosphate, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with a mixture of methanol and water (3:2) to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2, and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{22}H_{28}FNa_2O_8P$  in the portion of Betamethasone Sodium Phosphate taken by the formula:

$$200C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Betamethasone Sodium Phosphate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Sodium Phosphate Injection

» Betamethasone Sodium Phosphate Injection is a sterile solution of Betamethasone Sodium Phosphate in Water for Injection. It contains an amount of betamethasone sodium phosphate ( $C_{22}H_{28}FNa_2O_8P$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

### USP Reference standards (11)—

USP Betamethasone Sodium Phosphate RS  
USP Endotoxin RS

**Identification**—Dilute the Injection with methanol, if necessary, to obtain a solution containing about 2 mg of betamethasone sodium phosphate per mL. Separately apply 10  $\mu$ L of this test solution and 10  $\mu$ L of a solution of USP Betamethasone Sodium Phosphate RS in methanol containing 2 mg per mL to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with chromatographic silica gel mixture. Develop the chromatogram in an equilibrated chamber containing *n*-butyl alcohol previously shaken with 1 N hydrochloric acid, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, air-dry, then spray with a mixture of sulfuric acid, methanol, and nitric acid (10:10:1). Heat the plate at 105° for 10 minutes: the  $R_f$  value of the principal spot from the test solution corresponds to that obtained from the Standard solution.

**Bacterial endotoxins** (85)—It contains not more than 29.2 USP Endotoxin Units per mg of betamethasone.

**pH** (791): between 8.0 and 9.0.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and 0.05 M monobasic potassium phosphate (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer about 100 mg of butylparaben to a 100-mL volumetric flask, add methanol to volume, and mix.

**Standard preparation**—Using an accurately weighed quantity of USP Betamethasone Sodium Phosphate RS, prepare a solution in water containing 4 mg per mL. Transfer 3.0 mL of this solution to a 25-mL volumetric flask, add 5.0 mL of

**Internal standard solution**, dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.5 mg of USP Betamethasone Sodium Phosphate RS per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 9 mg of betamethasone, to a 25-mL volumetric flask. Add 5.0 mL of the *Internal standard solution*, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the analyte and internal standard peaks is not less than 5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 2.4 for butylparaben and 1.0 for betamethasone sodium phosphate. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_5$  in each mL of the Injection taken by the formula:

$$(392.47 / 516.41)(25C / V)(r_U / r_S)$$

in which 392.47 and 516.41 are the molecular weights of betamethasone and betamethasone sodium phosphate, respectively;  $C$  is the concentration, in mg per mL, of USP Betamethasone Sodium Phosphate RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injection taken; and  $r_U$  and  $r_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Sodium Phosphate and Betamethasone Acetate Injectable Suspension

» Betamethasone Sodium Phosphate and Betamethasone Acetate Injectable Suspension is a sterile preparation of Betamethasone Sodium Phosphate in solution and Betamethasone Acetate in suspension in Water for Injection. It contains an amount of betamethasone sodium phosphate ( $C_{22}H_{28}FNa_2O_8P$ ) equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ), and not less than 90.0 percent and not more than 115.0 percent of the labeled amount of betamethasone acetate ( $C_{24}H_{31}FO_6$ ).

**Packaging and storage**—Preserve in multiple-dose containers, preferably of Type I glass.

### USP Reference standards (11)—

USP Betamethasone Acetate RS  
USP Betamethasone Sodium Phosphate RS  
USP Endotoxin RS

### Identification—

**A: Thin-layer chromatographic identification test** (201)—

**Test solution**—Dilute 2 mL with 2 mL of methanol.

**Standard solution**—Prepare a solution of USP Betamethasone Sodium Phosphate RS in a mixture of methanol and water (1:1) having a concentration of 2 mg per mL.

*Developing solvent system, Spray reagent, and Procedure*—Proceed as directed for *Identification test B* under *Betamethasone sodium phosphate*.

**B:** *Test solution*—Use the *Test solution* prepared for *Identification test A*.

*Standard solution*—Prepare a solution of USP Betamethasone Acetate RS in a mixture of methanol and water (1:1) having a concentration of 1.5 mg per mL.

*Developing solvent system and Procedure*—Proceed as directed for *Identification test B* under *Betamethasone*.

**Bacterial endotoxins** (85)—It contains not more than 29.2 USP Endotoxin Units per mg of betamethasone.

**pH** (791): between 6.8 and 7.2.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and 0.075 M monobasic potassium phosphate (7:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Transfer about 50 mg of methyltestosterone to a 50-mL volumetric flask, add methanol to volume, and mix.

*Standard preparation*—Transfer about 63 mg of USP Betamethasone Sodium Phosphate RS, accurately weighed, to a 25-mL volumetric flask, add *Mobile phase* to volume, and mix (*Solution 1*). Transfer about 45 mg of USP Betamethasone Acetate RS, accurately weighed, to a 25-mL volumetric flask, add methanol to volume, and mix (*Solution 2*). Pipet 5 mL each of *Solution 1* and *Solution 2* into a 100-mL volumetric flask. Add 10.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having known concentrations of about 126 µg of USP Betamethasone Sodium Phosphate RS per mL and 90 µg of USP Betamethasone Acetate RS per mL.

*Assay preparation*—Using a “To contain” pipet transfer an accurately measured volume of the well-mixed Injectable Suspension, equivalent to about 9 mg of betamethasone acetate, to a 100-mL volumetric flask. Rinse the pipet with about 10 mL of *Mobile phase*, collecting the rinse in the volumetric flask. Add 10.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R_s$ , between the betamethasone phosphate and betamethasone acetate peaks is not less than 5.0, and the resolution,  $R_s$ , between the betamethasone acetate and internal standard peaks is not less than 3.0, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for betamethasone phosphate, 1.7 for methyltestosterone, and 1.0 for betamethasone acetate. Calculate the quantity, in mg, of betamethasone acetate ( $C_{24}H_{31}FO_6$ ) in each mL of the Injectable Suspension taken by the formula:

$$0.1 C / V(R_U / R_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Betamethasone Acetate RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injectable Suspension taken; and  $R_U$  and  $R_S$  are the peak response ratios obtained for betamethasone acetate and methyltestosterone from the *Assay preparation* and the *Standard preparation*, respectively.

Calculate the quantity, in mg, of betamethasone ( $C_{22}H_{29}FO_5$ ) equivalent to the quantity of betamethasone sodium phosphate ( $C_{22}H_{28}FNa_2O_8P$ ), in each mL of the Injectable Suspension taken by the formula:

$$(392.46/516.41)(0.1 C/V)(R_U / R_S)$$

in which 392.46 and 516.41 are the molecular weights of betamethasone and betamethasone sodium phosphate, respectively;  $C$  is the concentration, in µg per mL, of USP Betamethasone Sodium Phosphate RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injectable Suspension taken; and  $R_U$  and  $R_S$  are the peak response ratios obtained for betamethasone phosphate and methyltestosterone from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Valerate

$C_{27}H_{37}FO_6$  476.58

Pregna-1,4-diene-3,20-dione, 9-fluoro-11,21-dihydroxy-16-methyl-17-[(1-oxopentyl)oxy]-, (11β,16β)-

9-Fluoro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17-valerate [2152-44-5].

» Betamethasone Valerate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{27}H_{37}FO_6$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Beclomethasone Dipropionate RS

USP Betamethasone Valerate RS

#### Identification—

**A:** *Infrared Absorption* (197M).

**B:** *Thin-Layer Chromatographic Identification Test* (201)—

*Test solution*: 1 mg per mL, in alcohol.

*Developing solvent system*: a mixture of toluene and ethyl acetate (1:1).

*Procedure*—Proceed as directed in the chapter. Spray the plate with a mixture of sulfuric acid, methanol, and nitric acid (10:10:1), and heat at 105° for 15 minutes.

**Specific rotation** (781S): between +75° and +82°.

*Test solution*: 10 mg per mL, in dioxane.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.2%, a platinum crucible being used.

#### Chromatographic purity—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile, water, and glacial acetic acid (550:450:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Test solution*—Transfer about 4 mg of Betamethasone Valerate, accurately weighed, to a suitable flask. Add 10 mL of *Mobile phase*, and shake until dissolved.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the

*Test solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between betamethasone valerate and any impurity is not less than 1.5; and the column efficiency is not less than 9000 theoretical plates.

*Procedure*—Inject a volume (about 10  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Betamethasone Valerate taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of all the peak responses: not more than 1.0% of any individual impurity is found; and not more than 2.0% of total impurities is found.

#### Assay—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and water (3:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Transfer about 40 mg of beclomethasone dipropionate to a 100-mL volumetric flask, add a solution of glacial acetic acid in methanol (1 in 1000) to volume, and mix.

*Standard preparation*—Transfer about 30 mg of USP Betamethasone Valerate RS, accurately weighed, to a 50-mL volumetric flask, add a solution of glacial acetic acid in methanol (1 in 1000) to volume, and mix. Transfer 5.0 mL of this solution to a suitable stoppered vial, add 10.0 mL of *Internal standard solution*, and mix to obtain a solution having a known concentration of about 0.2 mg of USP Betamethasone Valerate RS per mL.

*Assay preparation*—Transfer about 60 mg of Betamethasone Valerate, accurately weighed, to a 100-mL volumetric flask, add a solution of glacial acetic acid in methanol (1 in 1000) to volume, and mix. Transfer 5.0 mL of this solution to a suitable stoppered vial, add 10.0 mL of *Internal standard solution*, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.7 for beclomethasone dipropionate and 1.0 for betamethasone valerate; the resolution,  $R$ , between betamethasone valerate and beclomethasone dipropionate is not less than 4.5; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{27}H_{37}FO_6$  in the portion of Betamethasone Valerate taken by the formula:

$$300C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Betamethasone Valerate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Valerate Cream

» Betamethasone Valerate Cream contains an amount of betamethasone valerate ( $C_{27}H_{37}FO_6$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount

of betamethasone ( $C_{22}H_{29}FO_5$ ), in a suitable cream base.

**Packaging and storage**—Preserve in collapsible tubes or in tight containers.

#### USP Reference standards (11)—

USP Beclomethasone Dipropionate RS

USP Betamethasone Valerate RS

**Identification**—Transfer an amount of Cream, equivalent to about 2 mg of betamethasone, to a separator, add 20 mL of water and 2 mL of dilute hydrochloric acid (1 in 120), and mix. Extract with four 50-mL portions of chloroform, and combine the extracts. Filter through a cotton pledget, previously layered over with anhydrous sodium sulfate. Evaporate the filtrates on a steam bath under a stream of dry nitrogen to dryness. Dissolve the residue in alcohol to obtain a solution containing about 1 mg per mL. Proceed as directed in *Identification test B* under *Betamethasone Valerate*, beginning with "Apply 10  $\mu$ L of this solution."

**Microbial enumeration tests (61) and Tests for specified microorganisms (62)**—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill (755):** meets the requirements.

#### Assay—

*Mobile phase*, *Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Betamethasone Valerate*.

*Assay preparation*—Transfer an accurately weighed portion of Cream, equivalent to about 2.5 mg of betamethasone, to a 50-mL centrifuge tube. Add 10.0 mL of the *Internal standard solution* and 5.0 mL of a 1 in 1000 solution of glacial acetic acid in methanol. Insert the stopper into the tube, and place in a water bath held at 60° until the specimen melts. Remove from the bath, and shake vigorously until the specimen resolidifies. Repeat the heating and shaking two more times. Place the tube in an ice-methanol bath for 20 minutes, then centrifuge to separate the phases. Decant the clear supernatant into a suitable stoppered flask, and allow to warm to room temperature.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Betamethasone Valerate*. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_5$  in the portion of Cream taken by the formula:

$$(392.46 / 476.59)(15C)(R_U / R_S)$$

in which 392.46 and 476.59 are the molecular weights of betamethasone and betamethasone valerate, respectively;  $C$  is the concentration, in mg per mL, of USP Betamethasone Valerate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Valerate Lotion

» Betamethasone Valerate Lotion contains an amount of Betamethasone Valerate ( $C_{27}H_{37}FO_6$ ) equivalent to not less than 95.0 percent and not more than 115.0 percent of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

#### USP Reference standards (11)—

USP Betamethasone Valerate RS

**Identification**—Mix an amount of Lotion, equivalent to about 5 mg of betamethasone, with a mixture of methanol and chloroform (2:1) to make 10 mL. Apply 20  $\mu$ L of this

solution and 20  $\mu\text{L}$  of a Standard solution of USP Betamethasone Valerate RS in a mixture of methanol and chloroform (2:1) containing 0.6 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform and ethyl acetate (1:1), until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. View the spots under UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** <755>: meets the requirements.

**pH** <791>: between 4.0 and 6.0.

#### Assay—

*Mobile phase and Chromatographic system*—Proceed as directed in the Assay under *Betamethasone Valerate*.

*Internal standard solution*—Transfer about 50 mg of beclomethasone dipropionate to a 25-mL volumetric flask, add chloroform to volume, and mix.

*Standard preparation*—Transfer about 40 mg of USP Betamethasone Valerate RS, accurately weighed, to a 25-mL volumetric flask, add chloroform to volume, and mix. Pipet 2 mL of this solution into a 50-mL centrifuge tube, add 10 mL of 0.1 N hydrochloric acid, then add 2.0 mL of *Internal standard solution*. Insert the stopper into the tube, shake vigorously for about 2 minutes, and centrifuge to separate the phases. Using a syringe, transfer the lower, chloroform phase to a small stoppered vial. Evaporate the chloroform on a steam bath, at low heat, with the aid of a stream of nitrogen. Add 4.0 mL of a 1 in 1000 solution of glacial acetic acid in methanol, and swirl to dissolve the residue.

*Assay preparation*—Transfer an accurately weighed portion of Lotion, equivalent to about 2.5 mg of betamethasone, to a stoppered, 50-mL centrifuge tube. Add 10.0 mL of 0.1 N hydrochloric acid, insert the stopper, and shake to disperse the specimen. Add 2.0 mL of chloroform and 2.0 mL of *Internal standard solution*, insert the stopper, and proceed as directed for *Standard preparation*, beginning with “shake vigorously for about 2 minutes.”

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Betamethasone Valerate*. Calculate the quantity, in mg, of betamethasone ( $\text{C}_{22}\text{H}_{29}\text{FO}_5$ ) in the portion of Lotion taken by the formula:

$$(392.46 / 476.59)(4C)(R_U / R_S)$$

in which 392.46 and 476.59 are the molecular weights of betamethasone and betamethasone valerate, respectively; C is the concentration, in mg per mL, of USP Betamethasone Valerate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betamethasone Valerate Ointment

» Betamethasone Valerate Ointment contains an amount of betamethasone valerate ( $\text{C}_{27}\text{H}_{37}\text{FO}_6$ ) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betamethasone ( $\text{C}_{22}\text{H}_{29}\text{FO}_5$ ), in a suitable ointment base.

**Packaging and storage**—Preserve in collapsible tubes or in tight containers, and avoid exposure to excessive heat.

#### USP Reference standards <11>—

USP Betamethasone Valerate RS

**Identification**—It responds to the *Identification* test under *Betamethasone Valerate Cream*.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** <755>: meets the requirements.

#### Assay—

*Mobile phase and Chromatographic system*—Proceed as directed in the Assay under *Betamethasone Valerate*.

*Internal standard solution*—Transfer about 20 mg of beclomethasone dipropionate to a 50-mL volumetric flask, add a 1 in 1000 solution of glacial acetic acid in alcohol to volume, and mix.

*Standard preparation*—Transfer about 30 mg of USP Betamethasone Valerate RS, accurately weighed, to a 50-mL volumetric flask, add a 1 in 1000 solution of glacial acetic acid in alcohol to volume, and mix. Transfer 5.0 mL of this solution to a suitable stoppered vial, add 10.0 mL of *Internal standard solution*, and mix to obtain a solution having a known concentration of about 0.2 mg of USP Betamethasone Valerate RS per mL.

*Assay preparation*—Transfer an accurately weighed portion of Ointment, equivalent to about 2.5 mg of betamethasone, to a 50-mL centrifuge tube. Add 10.0 mL of the *Internal standard solution* and 5.0 mL of a 1-in-1000 solution of glacial acetic acid in alcohol. Insert the stopper into the tube, and place in a water bath held at 70° until the specimen melts. Remove from the bath, and shake vigorously until the specimen resolidifies. Repeat the heating and shaking two more times. Place the tube in an ice-methanol bath for 20 minutes, then centrifuge to separate the phases. Decant the clear supernatant into a suitable stoppered flask, and allow to warm to room temperature.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Betamethasone Valerate*. Calculate the quantity, in mg, of  $\text{C}_{22}\text{H}_{29}\text{FO}_5$  in the portion of Ointment taken by the formula:

$$(392.46 / 476.59)(15C)(R_U / R_S)$$

in which 392.46 and 476.59 are the molecular weights of betamethasone and betamethasone valerate, respectively; C is the concentration, in mg per mL, of USP Betamethasone Valerate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betaxolol Hydrochloride

#### Change to read:

$\text{C}_{18}\text{H}_{29}\text{NO}_3 \cdot \text{HCl}$  343.89  
 ▲2-Propanol, 1-[4-[2-(cyclopropylmethoxy)ethyl]phenoxy]-3-[(1-methylethyl)amino]-, hydrochloride, ( $\pm$ ); ▲*USP36*  
 ( $\pm$ )-1-[p-[2-(Cyclopropylmethoxy)ethyl]phenoxy]-3-(isopropylamino)-2-propanol hydrochloride [63659-19-8].

**DEFINITION****Change to read:**

Betaxolol Hydrochloride contains  $\Delta$ NLT 98.0% and NMT 102.0% $\Delta$ <sup>USP36</sup> of betaxolol hydrochloride ( $C_{18}H_{29}NO_3 \cdot HCl$ ), calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** <197K>
- **B. IDENTIFICATION TESTS—GENERAL, Chloride** <191>  
**Analysis:** Proceed as directed for alkaloidal hydrochlorides.  
**Acceptance criteria:** Meets the requirements

**ASSAY****Change to read:**• **PROCEDURE**

$\Delta$ **Buffer:** 0.025 M monobasic potassium phosphate containing 0.1% (w/v) of tetrabutyl ammonium bromide. Adjust with 0.025 M phosphoric acid to a pH of 3.0.

**Mobile phase:** Acetonitrile and Buffer (15:85)

**System suitability solution:** 2.0 mg/mL of USP Betaxolol Hydrochloride RS and 1.0 mg/mL of alprenolol hydrochloride in *Mobile phase*

**Standard solution:** 2.0 mg/mL of USP Betaxolol Hydrochloride RS in *Mobile phase*

**Sample solution:** 2.0 mg/mL of Betaxolol Hydrochloride in *Mobile phase*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 273 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20  $\mu$ L

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times for alprenolol and betaxolol are 0.9 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.0 between alprenolol and betaxolol

**Tailing factor:** NMT 2.0 for the alprenolol and betaxolol peaks

**Relative standard deviation:** NMT 1.0% for the betaxolol peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of betaxolol hydrochloride ( $C_{18}H_{29}NO_3 \cdot HCl$ ) in the portion of Betaxolol Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Betaxolol Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Betaxolol Hydrochloride in the *Sample solution* (mg/mL) $\Delta$ <sup>USP36</sup>

**Acceptance criteria:**  $\Delta$ 98.0%–102.0% $\Delta$ <sup>USP36</sup> on the dried basis

**IMPURITIES**

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **HEAVY METALS, Method II** <231>: NMT 20 ppm

**Change to read:**• **ORGANIC IMPURITIES**

$\Delta$ **Buffer, Mobile phase, System suitability solution, Sample solution, and System suitability:** Proceed as directed in the *Assay*. $\Delta$ <sup>USP36</sup>

**Chromatographic system:**  $\Delta$ Proceed as directed in the *Assay*, except to use a run time of NLT 5 times the retention time of betaxolol. $\Delta$ <sup>USP36</sup>

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Betaxolol Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each individual peak other than the main betaxolol peak

$r_T$  = sum of all the peak responses

**Acceptance criteria:** NMT 1.0% for the sum of all impurities

**SPECIFIC TESTS****Delete the following:**

- $\Delta$ • **MELTING RANGE OR TEMPERATURE, Class I** <741>:

113°–117° $\Delta$ <sup>USP36</sup>

**Sample solution:** 20 mg/mL

**Acceptance criteria:** 4.5–6.5

- **LOSS ON DRYING** <731>

**Analysis:** Dry under vacuum at 65° for 2 h.

**Acceptance criteria:** NMT 1.0%

**ADDITIONAL REQUIREMENTS****Change to read:**

- **PACKAGING AND STORAGE:** Preserve in tight containers.

$\Delta$ Store at room temperature. $\Delta$ <sup>USP36</sup>

- **USP REFERENCE STANDARDS** <11>

USP Betaxolol Hydrochloride RS

**Betaxolol Ophthalmic Solution**

» Betaxolol Ophthalmic Solution is a sterile, aqueous, isotonic solution of Betaxolol Hydrochloride. It contains a suitable antimicrobial preservative. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betaxolol ( $C_{18}H_{29}NO_3$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Betaxolol Hydrochloride RS

**Identification**—Prepare a test solution by diluting a suitable volume of it with water to obtain a solution containing about 2.5 mg of betaxolol per mL. Separately apply 5  $\mu$ L of the test solution and 5  $\mu$ L of a Standard solution of USP Betaxolol Hydrochloride RS in water containing about 2.75 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm

layer of silica gel. Allow the spots to dry, and develop the chromatogram in a chromatographic chamber, using a solvent system consisting of a mixture of chloroform, isopropyl alcohol, and ammonium hydroxide (70:30:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the plate to air-dry. Spray the plate with a 1 in 1000 solution of ninhydrin in isopropyl alcohol, and heat the plate at 105° for 10 minutes. Locate the spots on the plate: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 4.0 and 8.0.

#### Assay—

**pH 3.0 Buffer**—Dissolve 7.1 g of anhydrous dibasic sodium phosphate in about 800 mL of water, adjust with phosphoric acid to a pH of 3.0, and dilute with water to make 1000 mL of solution.

**Mobile phase**—Prepare a suitable filtered and degassed mixture of pH 3.0 Buffer and acetonitrile (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Betaxolol Hydrochloride RS in pH 3.0 Buffer to obtain a solution having a known concentration of about 0.11 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 10 mg of betaxolol, to a 100-mL volumetric flask. Dilute with pH 3.0 Buffer to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm × 25-cm column that contains packing L1. The flow rate is about 1.1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , for the main betaxolol peak is between 1 and 3; the tailing factor is not less than 0.8 and not more than 2.0; the column efficiency is not less than 750 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{18}H_{29}NO_3$  in each mL of the Ophthalmic Solution taken by the formula:

$$(307.43 / 343.89)(100C / V)(r_U / r_S)$$

in which 307.43 and 343.89 are the molecular weights of betaxolol and betaxolol hydrochloride, respectively;  $C$  is the concentration, in mg per mL, of USP Betaxolol Hydrochloride RS in the *Standard preparation*;  $V$  is the volume, in mL, of Ophthalmic Solution taken; and  $r_U$  and  $r_S$  are the betaxolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Betaxolol Tablets

» Betaxolol Tablets contain an amount of Betaxolol Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of betaxolol hydrochloride ( $C_{18}H_{29}NO_3 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label the Tablets to state both the content of the betaxolol active moiety and the content of betaxolol hydrochloride used in formulating them.

#### USP Reference standards (11)—

USP Betaxolol Hydrochloride RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution (711)—

**Medium**: 0.01 N hydrochloric acid; 500 mL.

**Apparatus 2**: 50 rpm.

**Time**: 30 minutes.

**Procedure**—Determine the amount of  $C_{18}H_{29}NO_3 \cdot HCl$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 274 nm on filtered portions of the solution under test in comparison with a Standard solution having a known concentration of USP Betaxolol Hydrochloride RS in the same *Medium*. A 5-cm pathlength cell may be used for lower dosage levels.

**Tolerances**—Not less than 80% ( $Q$ ) of the labeled amount of  $C_{18}H_{29}NO_3 \cdot HCl$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Place 1 Tablet in a volumetric flask of appropriate size to obtain a concentration, based on the labeled amount of betaxolol hydrochloride per Tablet, of about 0.1 mg per mL when diluted. Add an amount of 0.1 N hydrochloric acid equal to about 70% of the volume of the flask, shake by mechanical means until dissolved, dilute with 0.1 N hydrochloric acid to volume, and mix. Filter the mixture, discarding the first 20 mL of the filtrate. Concomitantly determine the absorbances of the clear filtrate and of a Standard solution of USP Betaxolol Hydrochloride RS in 0.1 N hydrochloric acid having a known concentration of about 0.1 mg per mL, in 1-cm cells, at the wavelength of maximum absorbance at about 274 nm, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of betaxolol hydrochloride ( $C_{18}H_{29}NO_3 \cdot HCl$ ) in the Tablet taken by the formula:

$$(CV)(A_U / A_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Betaxolol Hydrochloride RS in the Standard solution;  $V$  is the volume, in mL, of 0.1 N hydrochloric acid used to dissolve the Tablet; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablet and the Standard solution, respectively.

#### Assay—

**Mobile phase**—Prepare a filtered mixture of 0.025 M pH 6.0 ammonium phosphate buffer, acetonitrile, and methanol (35:35:30). Mix, and degas under vacuum while stirring. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of acetonitrile and water (1:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Betaxolol Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 2 mg per mL.

**Assay preparation**—Dissolve not fewer than 20 Tablets in an appropriate accurately measured volume of *Diluent* so that the final concentration, based on the labeled amount per Tablet, is about 2 mg of betaxolol hydrochloride per mL. Sonicate until the Tablets are disintegrated. Cool to room temperature, dilute with *Diluent* to volume, mix, and filter. Use the clear filtrate as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 273-nm detector and a 4.6-mm × 15-cm column that contains packing L1.

The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, record the chromatogram, and measure the peak response as directed for *Procedure*: the tailing factor is not more than 3.0, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation*, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of betaxolol hydrochloride ( $C_{18}H_{29}NO_3 \cdot HCl$ ) in each Tablet taken by the formula:

$$(CV/N)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Betaxolol Hydrochloride RS in the *Standard preparation*; V is the volume of *Diluent* used to dissolve the Tablets; N is the number of Tablets taken; and  $r_U$  and  $r_S$  are the betaxolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bethanechol Chloride

$C_7H_{17}ClN_2O_2$  196.68

1-Propanaminium, 2-(aminocarbonyloxy)-*N,N,N*-trimethyl-, chloride, ( $\pm$ )-.

( $\pm$ )-(2-Hydroxypropyl)trimethylammonium chloride carbamate [590-63-6].

» Bethanechol Chloride contains not less than 98.0 percent and not more than 101.5 percent of  $C_7H_{17}ClN_2O_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Bethanechol Chloride RS

**Identification**—

**A:** *Infrared Absorption* (197M).

**B:** Dissolve about 50 mg in 2 mL of water, add 0.1 mL of cobaltous chloride solution (1 in 100), then add 0.1 mL of potassium ferrocyanide TS: an emerald-green color is produced, and almost entirely fades in 5 to 10 minutes (*distinction from choline chloride, which gives the same reaction but the color does not fade*).

**C:** To 1 mL of a solution (1 in 100) add 0.1 mL of iodine TS: a brown precipitate is formed, and it rapidly changes to a dark olive-green color.

**D:** A solution of it responds to the tests for *Chloride* (191).

**pH** (791): between 5.5 and 6.5, in a solution (1 in 100).

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method I** (231)—Dissolve 667 mg in 10 mL of water, add 2 mL of 1 N acetic acid, and dilute with water to 25 mL: the limit is 0.003%.

**Chloride content**—Dissolve about 400 mg, previously dried and accurately weighed, in 30 mL of water. Add 40.0 mL of 0.1 N silver nitrate VS, then add 3 mL of nitric acid and 5 mL of nitrobenzene, shake for a few minutes, add 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl: the content of Cl is between 17.7% and 18.3%.

## Related compounds—

**Buffer solution**—Transfer about 0.48 g of methanesulfonic acid to a 1000-mL volumetric flask. Dissolve in and dilute with water to volume.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (95:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve an accurately weighed quantity of USP Bethanechol Chloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1  $\mu$ g of USP Bethanechol Chloride RS per mL.

**Test solution**—Transfer about 25 mg of Bethanechol Chloride, accurately weighed, to a 250-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

**System suitability solution**—Transfer about 25 mg of Bethanechol Chloride, accurately weighed, to a 250-mL volumetric flask. Add 10 mL of 0.1 N sodium hydroxide, and allow to stand for about 15 minutes. Add 10 mL of 0.1 N hydrochloric acid. Dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatography system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a conductivity detector and a 3.9-  $\times$  150-mm column containing packing L55. The flow rate is about 1.0 mL per minute. The detector and column temperatures are maintained at 35° and 30°, respectively. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention time is about 0.9 for 2-hydroxypropyltrimethyl ammonium chloride and 1.0 for bethanechol; the resolution,  $R$ , between 2-hydroxypropyltrimethyl ammonium chloride and bethanechol is not less than 0.8. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 10.0% for bethanechol chloride.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Mobile phase*, the *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for all the peaks. Calculate the percentage of each impurity in the portion of Bethanechol Chloride taken by the formula:

$$25,000C(F/W)(r_i / r_S)$$

in which C is the concentration, in mg per mL, of USP Bethanechol Chloride RS in the *Standard solution*; F is the relative response factor and is equal to 0.79 for 2-hydroxypropyltrimethyl ammonium chloride and 1.0 for any other impurity; W is the weight, in mg, of Bethanechol Chloride taken to prepare the *Test solution*;  $r_i$  is the peak response for any impurity in the *Test solution*; and  $r_S$  is the peak response of USP Bethanechol Chloride RS in the *Standard solution*. Not more than 1.0% of 2-hydroxypropyltrimethyl ammonium is found; not more than 0.1% of any other impurity is found; and the sum of all the impurities is not more than 1.5%.

**Assay**—

**Buffer solution**—Transfer about 29 mg of edetic acid to a 1000-mL volumetric flask, and dissolve in 500 mL of water. Add 300  $\mu$ L of nitric acid to the volumetric flask, and dilute with water to volume. Pass through a 0.45- $\mu$ m nylon membrane filter.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (95:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Transfer about 25 mg of Bethanechol Chloride, accurately weighed, to a 250-mL volumetric flask. Add 10 mL of 0.1 N sodium hydroxide, and allow to stand for about 15 minutes. Add 10 mL of 0.1 N

hydrochloric acid. Dissolve in and dilute with *Mobile phase* to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Bethanechol Chloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg of USP Bethanechol Chloride RS per mL.

**Assay preparation**—Transfer about 25 mg of Bethanechol Chloride, accurately weighed, to a 250-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a conductivity detector and a 3.9- × 150-mm column containing packing L55. The flow rate is about 1.0 mL per minute. The detector and column temperatures are maintained at 35° and 30°, respectively. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for 2-hydroxypropyltrimethyl ammonium chloride and 1.0 for bethanechol; and the resolution,  $R$ , between 2-hydroxypropyltrimethyl ammonium chloride and bethanechol is not less than 0.8. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 3.5; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of  $C_7H_{17}ClN_2O_2$  in the portion of Bethanechol Chloride taken by the formula:

$$250C(r_u / r_s)$$

in which  $C$  is the concentration, in mg per mL, of USP Bethanechol Chloride RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the bethanechol chloride peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bethanechol Chloride Injection

» Bethanechol Chloride Injection is a sterile solution of Bethanechol Chloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_7H_{17}ClN_2O_2$ .

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

**USP Reference standards** <11>—

USP Bethanechol Chloride RS

USP Endotoxin RS

**Identification**—It responds to *Identification tests B, C, and D* under *Bethanechol Chloride*.

**Bacterial endotoxins** <85>—It contains not more than 25.0 USP Endotoxin Units per mg of bethanechol chloride.

**pH** <791>: between 5.5 and 7.5.

**Limit of 2-hydroxypropyltrimethyl ammonium chloride**—

*Diluent, Mobile phase, System suitability solution, and Chromatographic system*—Prepare as directed in the *Assay*.

*2-Hydroxypropyltrimethyl ammonium chloride solution*—Transfer 50.0 mg of bethanechol chloride into a 50-mL volu-

metric flask. Add about 40 mL of 0.1 N sodium hydroxide, and sonicate until fully dissolved. Dilute with 0.1 N sodium hydroxide to volume, and allow to stand for five days to allow adequate time for conversion from bethanechol to 2-hydroxypropyltrimethyl ammonium chloride. Chromatograph as directed for *Procedure* to verify the presence and location of the peak for 2-hydroxypropyltrimethyl ammonium chloride.

**Standard solution**—Use the *Standard preparation*, prepared as directed in the *Assay*.

**Test solution**—Use the *Assay preparation*.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *2-Hydroxypropyltrimethyl ammonium chloride solution*, the *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the bethanechol and 2-hydroxypropyltrimethyl ammonium chloride peaks. Calculate the percentage of 2-hydroxypropyltrimethyl ammonium chloride in each mL of the Injection taken by the formula:

$$100(C_s / C_i)(r_i / r_s)$$

in which  $C_s$  is the concentration, in mg per mL, of USP Bethanechol Chloride RS in the *Standard solution*;  $C_i$  is the concentration, in mg per mL, of bethanechol chloride in the *Test solution*;  $r_i$  is the peak response for 2-hydroxypropyltrimethyl ammonium chloride obtained from the *Test solution*; and  $r_s$  is the peak response for bethanechol obtained from the *Standard solution*. Not more than 4.0% is found.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—

**Diluent**—Transfer 10 mg of calcium chloride and 10 mg of magnesium chloride to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

**Mobile phase**—Prepare a filtered and degassed solution of 20 mM methanesulfonic acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Transfer 25 mg of USP Bethanechol Chloride RS, accurately weighed, to a 25-mL volumetric flask, and add 15 mL of water, 2.0 mL of the *Diluent*, and 0.5 mL of 0.1 N sodium hydroxide. Dilute with water to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Bethanechol Chloride RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 1.0 mg per mL.

**Assay preparation**—Dilute an accurately measured volume of Injection, if necessary, with water to obtain a solution having a concentration of about 1.0 mg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a conductivity detector and a 4-mm × 25-cm column that contains packing L53. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are 1.0 for sodium, 1.4 for magnesium, 1.6 for calcium, 2.0 for 2-hydroxypropyltrimethyl ammonium chloride, and 2.8 for bethanechol; the resolution,  $R$ , between the calcium ion and 2-hydroxypropyltrimethyl ammonium chloride is not less than 2.0; the column efficiency determined from the bethanechol peak is not less than 350 theoretical plates; the tailing factor is not more than 4.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of bethanechol chloride ( $C_7H_{17}ClN_2O_2$ ) in each mL of the Injection taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Bethanechol Chloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bethanechol Chloride Oral Solution

### DEFINITION

Bethanechol Chloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of bethanechol chloride ( $C_7H_{17}ClN_2O_2$ ).

Prepare Bethanechol Chloride Oral Solution 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Bethanechol Chloride	500 mg
Vehicle for Oral Solution (regular or sugar-free), <i>NF</i> , a sufficient quantity to make	100 mL

Add *Bethanechol Chloride* powder and about 20 mL of *Vehicle* to a mortar, and mix. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough *Vehicle* to bring to final volume, and mix well.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile and water (33:67)

**Standard solution:** 500 µg/mL of USP Bethanechol Chloride RS in *Mobile phase*

**Sample solution:** Agitate the container of Oral Solution for 30 min on a rotating mixer, remove a 10-mL sample, and store in a clear glass vial at  $-70^\circ$  until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 s. Dilute a suitable volume of Oral Solution with *Mobile phase* to obtain a nominal concentration of 500 µg/mL of bethanechol chloride.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 200 nm

**Column:** 4.6-mm  $\times$  25-cm; 5-µm packing L11

**Flow rate:** 0.7 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time of bethanechol chloride is about 3 min.]

#### Suitability requirements

**Relative standard deviation:** NMT 3.1% for replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of bethanechol chloride ( $C_7H_{17}ClN_2O_2$ ) in the portion of Oral Solution taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of bethanechol chloride in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of bethanechol chloride in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

### SPECIFIC TESTS

• **PH (791):** 3.9–4.9

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at room temperature or in a cold place.
- **BEYOND-USE DATE:** NMT 60 days after the day on which it was compounded
- **LABELING:** Label it to state the *Beyond-Use Date*.
- **USP REFERENCE STANDARDS (11)**  
USP Bethanechol Chloride RS

## Bethanechol Chloride Oral Suspension

### DEFINITION

Bethanechol Chloride Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of bethanechol chloride ( $C_7H_{17}ClN_2O_2$ ).

Prepare Bethanechol Chloride Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Bethanechol Chloride	500 mg
Vehicle: a mixture of Vehicle for Oral Solution, (regular or sugar-free), <i>NF</i> and Vehicle for Oral Suspension, <i>NF</i> (1:1), a sufficient quantity to make	100 mL

If using *Bethanechol Chloride* tablets, add to a suitable mortar and comminute to a fine powder, or add the *Bethanechol Chloride* powder to the mortar. Add about 20 mL of the *Vehicle*, and mix to a uniform paste. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient *Vehicle* to final volume, and mix well.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile and water (33:67)

**Standard solution:** 500 µg/mL of USP Bethanechol Chloride RS in *Mobile phase*

**Sample solution:** Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 10-mL sample, and store in a clear glass vial at  $-70^\circ$  until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 s. Dilute a suitable volume of Oral Suspension with *Mobile phase* to obtain a nominal concentration of 500 µg/mL of bethanechol chloride.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 200 nm

**Column:** 4.6-mm  $\times$  25-cm; 5-µm packing L11

**Flow rate:** 0.7 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time for bethanechol chloride is about 3 min.]

#### Suitability requirements

**Relative standard deviation:** NMT 3.1% for replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of bethanechol chloride ( $C_7H_{17}ClN_2O_2$ ) in the volume of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of bethanechol chloride in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = nominal concentration of bethanechol chloride in the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

- **PH** (791): 3.9–4.9

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at room temperature, or in a cold place.
- **LABELING:** Label it to state that it is to be well shaken, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 60 days after the day on which it was compounded.
- **USP REFERENCE STANDARDS** (11)  
USP Bethanechol Chloride RS

**Bethanechol Chloride Tablets**

» Bethanechol Chloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of bethanechol chloride ( $C_7H_{17}ClN_2O_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Bethanechol Chloride RS

**Identification**—Pulverize a quantity of Tablets, equivalent to about 100 mg of bethanechol chloride, add 15 mL of ether, and allow to digest for 15 minutes. Decant the ether, again extract the residue with 10 mL of ether, and discard the ether extracts. To the residue add 30 mL of alcohol, shake for 10 minutes, and allow to stand for 1 hour with frequent agitation. Filter with suction, and evaporate the filtrate on a steam bath to dryness: the bethanechol chloride so obtained, recrystallized from alcohol and dried at 105° for 2 hours, responds to *Identification test A* under *Bethanechol Chloride*.

**Dissolution** (711)—

*Medium:* 0.1 N hydrochloric acid; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

Determine the amount of bethanechol chloride ( $C_7H_{17}ClN_2O_2$ ) dissolved using the following method.

*Buffer solution, Mobile phase, and Chromatographic system*—Proceed as directed in *Assay*.

*Standard solution*—Dissolve an accurately weighed quantity of USP Bethanechol Chloride RS in *Medium*, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration of USP Bethanechol Chloride RS approximately corresponding to the concentration of the solution under test.

*Procedure*—Separately inject equal volumes (about 100  $\mu\text{L}$ ) of a filtered portion of the solution under test and the *Standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major

peaks. Calculate the quantity of bethanechol chloride ( $C_7H_{17}ClN_2O_2$ ) dissolved based on the peak responses obtained from the solution under test and the *Standard solution*.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_7H_{17}ClN_2O_2$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Related compounds**—

*Buffer solution*—Transfer about 0.48 g of methanesulfonic acid to a 1000-mL volumetric flask. Dissolve in and dilute with water to volume.

*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (95:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Dissolve an accurately weighed quantity of USP Bethanechol Chloride RS in *Mobile phase*, and dilute quantitatively and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1  $\mu\text{g}$  of USP Bethanechol Chloride RS per mL.

*Test solution*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to 1 Tablet, to a suitable volumetric flask so that the final solution yields a concentration of about 0.1 mg per mL of bethanechol chloride. Add an amount of *Mobile phase*, about 60% to 70% of the total volume of the flask. Sonicate for 20 minutes. Shake by mechanical means for about 15 minutes. Dilute with *Mobile phase* to volume, and mix. Allow to stand for 10 minutes, and pass the solution through a 1- $\mu\text{m}$  glass filter, discarding the first 3 mL of the filtrate.

*System suitability solution*—Transfer about 25 mg of bethanechol chloride, accurately weighed, to a 250-mL volumetric flask. Add 10 mL of 0.1 N sodium hydroxide, and allow to stand for about 15 minutes. Add 10 mL of 0.1 N hydrochloric acid. Dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a conductivity detector and a 3.9-  $\times$  150-mm column containing packing L55. The flow rate is about 1.0 mL per minute. The detector and column temperatures are maintained at 35° and 30°, respectively. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for 2-hydroxypropyltrimethyl ammonium chloride and 1.0 for bethanechol; and the resolution, *R*, between 2-hydroxypropyltrimethyl ammonium chloride and bethanechol is not less than 0.8. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 10.0% for bethanechol chloride.

*Procedure*—Separately inject equal volumes (about 50  $\mu\text{L}$ ) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all of the peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100V(F/W)C(r_i / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Bethanechol Chloride RS in the *Standard solution*; *F* is the relative response factor and is equal to 0.79 for 2-hydroxypropyltrimethyl ammonium chloride and 1.0 for any other impurity;  $r_i$  is the peak response for any impurity in the *Test solution*;  $r_s$  is the peak response of USP Bethanechol Chloride RS in the *Standard solution*; and *W* is the amount, in mg, of bethanechol chloride based on the average weight, labeled dose, and amount taken to prepare the *Test solution*. Not more than 1.0% of 2-hydroxypropyltrimethyl ammonium chloride is found; not more than 0.2% of any other impurity

is found; and the sum of all the impurities is not more than 1.5%.

#### Assay—

**Buffer solution**—Transfer about 29 mg of edetic acid to a 1000-mL volumetric flask, and dissolve in 500 mL of water. Add 300  $\mu$ L of nitric acid to the volumetric flask, and dilute with water to volume. Pass through a 0.45- $\mu$ m nylon membrane filter.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (95:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Bethanechol Chloride RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg of USP Bethanechol Chloride RS per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to 1 Tablet, to a suitable volumetric flask so that the final solution yields a concentration of about 0.1 mg per mL of bethanechol chloride. Add an amount of *Mobile phase*, about 60% to 70% of the total volume of the flask. Sonicate for 20 minutes. Shake by mechanical means for about 15 minutes. Dilute with *Mobile phase* to volume, and mix. Allow to stand for 10 minutes, and pass the solution through a 1- $\mu$ m glass filter, discarding the first 3 mL of the filtrate.

**System suitability solution**—Transfer about 25 mg of bethanechol chloride, accurately weighed, to a 250-mL volumetric flask. Add 10 mL of 0.1 N sodium hydroxide, and allow to stand for about 15 minutes. Add 10 mL of 0.1 N hydrochloric acid. Dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a conductivity detector and a 3.9-  $\times$  150-mm column containing packing L55. The flow rate is about 1.0 mL per minute. The detector and column temperatures are maintained at 35° and 30°, respectively. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention time is about 0.9 for 2-hydroxypropyltrimethyl ammonium chloride and 1.0 for bethanechol; and the resolution, *R*, between 2-hydroxypropyltrimethyl ammonium chloride and bethanechol is not less than 0.8. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 3.5; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of bethanechol chloride (C<sub>7</sub>H<sub>17</sub>ClN<sub>2</sub>O<sub>2</sub>) in the portion of Tablets taken by the formula:

$$VC(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Bethanechol Chloride RS in the *Standard preparation*; *V* is the volume, in mL, of the flask used to prepare the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the bethanechol chloride peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bicalutamide

C<sub>18</sub>H<sub>14</sub>F<sub>4</sub>N<sub>2</sub>O<sub>4</sub>S 430.37  
 Propanamide, N-[4-cyano-3-(trifluoromethyl)phenyl]-3-[(4-fluorophenyl)sulfonyl]-2-hydroxy-2-methyl-, (±)-; (±)-4'-Cyano- $\alpha,\alpha,\alpha$ -trifluoro-3-[(*p*-fluorophenyl)sulfonyl]-2-methyl-*m*-lactotoluidide [90357-06-5].

#### DEFINITION

Bicalutamide contains NLT 98.0% and NMT 102.0% of C<sub>18</sub>H<sub>14</sub>F<sub>4</sub>N<sub>2</sub>O<sub>4</sub>S, calculated on the anhydrous and solvent-free basis.

#### IDENTIFICATION

- A. INFRARED ABSORPTION** <197M>
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### PROCEDURE

**SPECIFIC TESTS**

- **WATER DETERMINATION**, *Method I* (921): NMT 0.2%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at room temperature.
- **USP REFERENCE STANDARDS** (11)
  - USP Bicalutamide RS
  - USP Bicalutamide Related Compound A RS
  - [*N*-[4-cyano-3-(trifluoromethyl)phenyl]-3-[(4-fluorophenyl)sulfinyl]-2-hydroxy-2-methylpropanamide] ( $C_{18}H_{14}F_4N_2O_3S$  414.37)

**Bicalutamide Tablets**

» Bicalutamide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of bicalutamide ( $C_{18}H_{14}F_4N_2O_4S$ ).

**Packaging and storage**—Preserve in tight containers. Store at controlled room temperature.

**Labeling**—When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

**USP Reference standards** (11)—

USP Bicalutamide RS

USP Bicalutamide Related Compound B RS

(*RS*)-*N*-[4-Cyano-3-(trifluoromethyl)phenyl]-3-(3-fluorophenylsulfonyl)-2-hydroxy-2-methylpropanamide.  
 $C_{18}H_{14}F_4N_2O_4S$  430.37

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

TEST 1—

**Medium:** 1.0% w/v sodium lauryl sulfate in water; 1000 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

**Standard solution**—Transfer about 10 mg, accurately weighed, of USP Bicalutamide RS to a 200-mL volumetric flask, dissolve in 2 mL of tetrahydrofuran, and dilute with *Medium* to volume.

**Test solution**—Pass the solution under test through a suitable 0.45- $\mu$ m filter.

**Procedure**—Determine the amount of  $C_{18}H_{14}F_4N_2O_4S$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 270 nm on portions of the *Test solution* in comparison with the *Standard solution*, using the *Medium* as the blank. Calculate the percentage of bicalutamide ( $C_{18}H_{14}F_4N_2O_4S$ ) dissolved by the formula:

$$\frac{A_U \times C_S \times 1000 \times 100}{A_S \times L}$$

in which  $A_U$  and  $A_S$  are the absorbances obtained from the *Test solution* and the *Standard solution*, respectively;  $C_S$  is the concentration, in mg per mL, of bicalutamide in the *Standard solution*; 1000 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and  $L$  is the Tablet label claim, in mg.

**Tolerances**—Not less than 80% (Q) of the labeled amount of bicalutamide is dissolved in 45 minutes.

**TEST 2**—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

**Medium, Apparatus 2, Time, Standard solution, Test solution, and Procedure**—Proceed as directed for *Test 1*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of bicalutamide is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

**1% Sodium lauryl sulfate solution**—Dissolve 15 g of sodium lauryl sulfate in 1.5 L of water.

**Standard solution**—Dissolve an accurately weighed quantity of USP Bicalutamide RS in a minimum amount of tetrahydrofuran, and dilute quantitatively with 1% Sodium lauryl sulfate solution to obtain a solution having a known concentration of about 0.05 mg per mL.

**Test solution**—Transfer 1 Tablet to a 100-mL volumetric flask, add about 10 mL of water, and sonicate for approximately 30 minutes. Add about 80 mL of tetrahydrofuran, and sonicate for 30 minutes to complete dissolution of the bicalutamide. Allow to cool to room temperature, and dilute with tetrahydrofuran to volume. Pass this solution through a 0.45- $\mu$ m suitable filter unit, transfer 10.0 mL of filtrate to a 100-mL volumetric flask, and dilute with 1% Sodium lauryl sulfate solution to volume.

**Procedure**—Concomitantly determine the UV absorbances of the *Standard solution* and the *Test solution* with a suitable spectrophotometer at 270 nm, using 1% Sodium lauryl sulfate solution as the blank. Calculate the quantity, in mg, of bicalutamide ( $C_{18}H_{14}F_4N_2O_4S$ ) in the Tablet taken by the formula:

$$1000C(A_U / A_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Bicalutamide RS in the *Standard solution*; and  $A_U$  and  $A_S$  are the absorbances obtained from the *Test solution* and the *Standard solution*, respectively.

**Limit of 4-amino-2-(trifluoromethyl)benzonitrile**—

**Mobile phase and System suitability solution**—Proceed as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Bicalutamide RS in tetrahydrofuran to obtain a solution having a known concentration of about 0.2 mg per

mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Test solution**—Transfer an accurately weighed quantity of the powdered Tablet prepared in the *Assay preparation*, equivalent to about 50 mg of bicalutamide, to a 25-mL volumetric flask. Add about 2 mL of tetrahydrofuran, and allow to stand for 5 minutes. Add about 20 mL of *Mobile phase*, and sonicate for 10 minutes. Allow to cool to room temperature, and dilute with *Mobile phase* to volume. Pass the sample through a suitable 0.2- $\mu$ m filter.

**Chromatographic system** (see *Chromatography* <621>)—Proceed as directed in the *Assay*, except to use a liquid chromatograph equipped with a 220-nm detector.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of 4-amino-2-(trifluoromethyl)benzonitrile in the portion of Tablets taken by the formula:

$$100(1/1.4)(C_S / C_U)(r_U / r_S)$$

in which 1.4 is the relative response factor for 4-amino-2-(trifluoromethyl)benzonitrile,  $C_S$  is the concentration, in mg per mL, of USP Bicalutamide RS in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of bicalutamide in the *Test solution* based on the label claim;  $r_U$  is the peak area for 4-amino-2-(trifluoromethyl)benzonitrile obtained from the *Test solution*; and  $r_S$  is the peak area for bicalutamide obtained from the *Standard solution*; not more than 0.1% of 4-amino-2-(trifluoromethyl)benzonitrile is found. [NOTE—The relative retention time for 4-amino-2-(trifluoromethyl)benzonitrile is about 0.4.]

**Assay**—

**Mobile phase**—Prepare a mixture of water, tetrahydrofuran, and acetonitrile (65:20:15).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Bicalutamide RS in tetrahydrofuran to obtain a solution having a known concentration of about 0.8 mg per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Assay preparation**—Grind not fewer than 20 Tablets to a fine powder. Transfer an accurately weighed quantity of powdered Tablets, equivalent to about 50 mg of bicalutamide, to a 100-mL volumetric flask. Add about 50 mL of tetrahydrofuran, and sonicate for at least 10 minutes to complete dissolution. Allow to cool to room temperature, and dilute with tetrahydrofuran to volume. Pass this solution through a suitable 0.45- $\mu$ m filter. Transfer 4.0 mL of the filtrate to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

**System suitability solution**—Dissolve suitable quantities of USP Bicalutamide RS and USP Bicalutamide Related Compound B RS in tetrahydrofuran to obtain a solution having known concentrations of about 0.8 mg of USP Bicalutamide RS per mL and 0.4 mg of USP Bicalutamide Related Compound B RS per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 270-nm detector, and a 5-mm  $\times$  12.5-cm column that contains 3- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 50°. Chromatograph the *System suitability solution*, and record the peak areas as directed for *Procedure*: the relative retention time for the bicalutamide related compound B peak is about 1.1; the resolution,  $R$ , between bicalutamide and bicalutamide related compound B is greater than 1.9; the tailing factor of the bicalutamide peak is less than 1.3; and the relative standard deviation for replicate injections calculated for the bicalutamide peak is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the bicalutamide peaks. Calculate the quantity, in percentage of the label claim, of bicalutamide ( $C_{18}H_{14}F_4N_2O_4S$ ) in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Bicalutamide RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of bicalutamide in the *Assay preparation* based on the label claim; and  $r_U$  and  $r_S$  are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Biological Indicator for Dry-Heat Sterilization, Paper Carrier

» Biological Indicator for Dry-Heat Sterilization, Paper Carrier, is a defined preparation of viable spores made from a culture derived from a specified strain of *Bacillus subtilis* subspecies *niger*, on a suitable grade of paper carrier, individually packaged in a container readily penetrable by dry heat, and characterized for predictable resistance to dry-heat sterilization. The packaged Biological Indicator for Dry-Heat Sterilization, Paper Carrier, has a particular labeled spore count per carrier of not less than  $10^4$  and not more than  $10^9$  spores. When labeled for and subjected to dry-heat sterilization conditions at a particular temperature, it has a survival time and kill time appropriate to the labeled spore count and to the decimal reduction value (*D value*, in minutes) of the preparation, specified by:

*Survival time* (in minutes) = not less than (labeled *D value*)  $\times$  (log labeled spore count per carrier – 2); and

*Kill time* (in minutes) = not more than (labeled *D value*)  $\times$  (log labeled spore count per carrier + 4).

**Packaging and storage**—Preserve in the original package under the conditions recommended on the label, and protect from light, toxic substances, excessive heat, and moisture. The packaging and container materials do not adversely affect the performance of the article used as directed in the labeling.

**Expiration date**—The expiration date is determined on the basis of stability studies and is not less than 18 months from the date of manufacture, the date of manufacture being the date on which the first determination of the total viable spore count was made.

**Labeling**—Label it to state that it is a Biological Indicator for Dry-Heat Sterilization, Paper Carrier; to indicate its *D value* and the method used to determine such *D value*, i.e., by spore count or fraction negative procedure after graded exposures to the sterilization conditions; the survival time and kill time under the specified sterilization conditions stated on the label; its particular total viable spore count, with a statement that such count has been determined after preliminary heat treatment; and its recommended storage conditions. State in the labeling the size of the paper carrier, the strain and ATCC number from which the spores were

derived, and instructions for spore recovery and for safe disposal of the indicator. Indicate in the labeling that the stated *D value* is reproducible only under the exact conditions under which it was determined, that the user would not necessarily obtain the same result, and that the user should determine the suitability of the biological indicator for the particular use.

**Identification**—The biological indicator organism complies substantially with the morphological, cultural, and biochemical characteristics of the strain of *Bacillus subtilis*, ATCC No. 9372, designated subspecies *niger*, detailed for that biological indicator organism under *Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier*.

#### Resistance performance tests—

*D value*—Proceed as directed for the relevant procedure for *D Value* under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the determined *D value* is within 20% of the labeled *D value* for the selected sterilizing temperature, and if the confidence limits of the estimate are within 10% of the determined *D value*.

*Survival time and kill time*—Proceed as directed for *Survival Time and Kill Time* in the section *Dry-Heat Sterilization, Paper Carrier*, under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if all of the specimens subjected to dry-heat sterilization for the survival time show evidence of growth, while none of the specimens subjected to dry-heat sterilization for the kill time shows growth. If for either the survival time test or the kill time test not more than 1 specimen out of both groups fails the survival requirement or the kill requirement (whichever is applicable), continue the corresponding test with 4 additional groups, each consisting of 20 specimens, according to the procedure described. If all of the additional specimens subjected to dry-heat sterilization either meet the survival requirement for the survival time test or meet the kill requirement for the kill time test, whichever is applicable, the requirements of the test are met.

*Total viable spore count*—Proceed as directed for *Total Viable Spore Count* under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the log average number of viable spores per carrier is not less than 0.3 log of the labeled spore count per carrier and does not exceed the log labeled spore count per carrier by 0.48.

#### Purity—

*Presence of contamination by other microorganisms*—By examination of the spores on a suitable plate culture medium, there is no evidence of contamination with other microorganisms.

**Disposal**—Prior to destruction or discard, sterilize it by steam at 121° for not less than 30 minutes, or by not less than an equivalent method recommended by the manufacturer. This includes a test strip employed in any test procedures for the strips themselves.

### Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier

» Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier, is a defined preparation of viable spores made from a culture derived from a specified strain of *Bacillus subtilis* subspecies *niger* on a suitable grade of paper carrier, individually packaged in a suitable container readily penetrable by ethylene oxide sterilizing gas mixture, and characterized for predictable resistance to sterilization with such gas mixture. The packaged

Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier, has a particular labeled spore count per carrier of not less than  $10^4$  and not more than  $10^9$  spores. Where labeled for and subjected to particular ethylene oxide sterilization conditions of a stated gaseous mixture, temperature, and relative humidity, it has a survival time and kill time appropriate to the labeled spore count and to the decimal reduction value (*D* value, in minutes) of the preparation, specified by:

*Survival time* (in minutes) = not less than (labeled *D* value)  $\times$  (log labeled spore count per carrier – 2), and

*Kill time* (in minutes) = not more than (labeled *D* value)  $\times$  (log labeled spore count per carrier + 4).

**Packaging and storage**—Preserve in the original package under the conditions recommended on the label, and protect it from light, toxic substances, excessive heat, and moisture. The packaging and container material shall be such that it does not adversely affect the performance of the article used as directed in the labeling.

**Expiration date**—The expiration date is determined on the basis of stability studies and is not less than 18 months from the date of manufacture, the date of manufacture being the date on which the first determination of the total viable spore count was made.

**Labeling**—Label it to state that it is a Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier; to indicate its *D* value, the method used to determine such *D* value, i.e., by spore count or fraction negative procedure after graded exposures to the sterilization conditions; the survival time and kill time under specified sterilization conditions stated on the label; its particular total viable spore count, with a statement that such count has been determined after preliminary heat treatment; and its recommended storage conditions. State in the labeling the size of the paper carrier, the strain and ATCC number from which the spores were derived, and instructions for spore recovery and for safe disposal of the indicator. Indicate in the labeling that the stated *D* value is reproducible only under the exact conditions under which it was determined, that the user would not necessarily obtain the same result, and that the user should determine the suitability of the biological indicator for the particular use.

**Identification**—The biological indicator organism complies substantially with the morphological, cultural, and biochemical characteristics of the strain of *Bacillus subtilis*, ATCC No. 9372, designated subspecies *niger*: under microscopic examination it consists of Gram-positive rods of width 0.7 to 0.8  $\mu\text{m}$ , and length 2 to 3  $\mu\text{m}$ ; the endospores are oval and central and the cells are not swollen; when incubated aerobically in appropriate media at 30° to 35°, growth occurs within 24 hours, and similar inoculated media incubated concomitantly at 55° to 60° show no evidence of growth in the same period; agar colonies have a dull appearance and may be cream or brown-colored; when incubated in nutrient broth it develops a pellicle, and shows little or no turbidity; when examined under conventional biochemical tests for microbial characterization, it develops a black pigment with tyrosine, it liquefies gelatin, utilizes citrate but not propionate or hippurate, reduces nitrate, and hydrolyzes both starch and glucose with no gas production; it shows a positive catalase reaction and gives a positive result with the Voges-Proskauer test.

#### **Resistance performance tests—**

*D* value—Proceed as directed for the relevant procedure for *D* value under *Biological Indicators—Resistance Performance Tests* (55).

The requirements of the test are met if the determined *D* value is within 20% of the labeled *D* value for the selected sterilizing temperature and if the confidence limits of the estimate are within 10% of the determined *D* value.

*Survival time and kill time*—Proceed as directed for *Survival Time and Kill Time* in the section *Ethylene Oxide Sterilization, Paper Carrier*, under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if all of the specimens subjected to the ethylene oxide sterilization conditions for the survival time show evidence of growth, while none of the specimens subjected to the ethylene oxide sterilization conditions for the kill time shows evidence of growth. If for either the survival time test or the kill time test, not more than 1 specimen out of both groups fails the survival requirement or the kill requirement (whichever is applicable), continue the corresponding test with 4 additional groups, each consisting of 20 specimens, according to the procedure described. If all of the additional specimens subjected to ethylene oxide sterilization meet either the survival requirement for the survival time test or the kill requirement for the kill time test, whichever is applicable, the requirements of the test are met.

*Total viable spore count*—Follow the procedure for *Total Viable Spore Count* in the section *Ethylene Oxide Sterilization, Paper Carrier*, under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the log average number of viable spores per carrier is not less than 0.3 log of the labeled spore count per carrier and does not exceed the log labeled spore count per carrier by 0.48.

#### **Purity—**

*Presence of contamination by other microorganisms*—By examination of the spores on a suitable plate culture medium, there is no evidence of contamination with other microorganisms.

**Disposal**—Prior to destruction or discard, sterilize it by steam at 121° for not less than 30 minutes, or by not less than an equivalent method recommended by the manufacturer. This includes a strip used in test procedures for strips themselves.

---

### **Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions**

---

» Liquid spore suspensions may be used to prepare biological indicators for moist heat, dry heat, and gaseous modes of sterilization. On the basis of the intended sterilization use, the suspension is prepared inoculated from a culture of viable spores derived from one of several sterilization resistant microorganisms. Cultures used for liquid spore suspensions include, among others, the following: *Clostridium sporogenes*, *Geobacillus stearothermophilus* (formerly *B. stearothermophilus*), *Bacillus atrophaeus* (formerly *B. subtilis*), *Bacillus subtilis*, or *Bacillus coagulans*. Each tube or container containing the spore suspension is individually packaged for use. The packaged biological indicator spore suspension has a particular labeled spore count of not less than  $10^3$ , and not more than  $10^9$ , spores per mL of suspension. The suspending medium or vehicle is identified according to chemical composition. It has a survival time and kill time appropriate to the labeled

spore count, and to the decimal reduction value (the *D value*, in minutes), specified by the following:

*Survival time* (in minutes) = not less than (labeled *D value*)  $\times$  (log of labeled spore count per mL from 1:100 dilution of original suspension – 2); and

*Kill time* (in minutes) = not more than (labeled *D value*)  $\times$  (log of labeled spore count per mL from 1 : 100 dilution of original suspension + 4).

**Packaging and storage**—Preserve in the original tube or container under the conditions recommended on the label, and protect the contents of the tube or container from light, toxic substances, and excessive heat. The materials of composition of the tube or container must not adversely affect the performance of the spore suspension.

**Expiration date**—The expiration date is determined on the basis of stability studies. The date of manufacture is the date on which the first determination of the total viable count was made.

**Labeling**—Label the spore suspension tube or container or package insert to state that it is a biological indicator spore suspension for use in label specified applications for moist-heat, dry-heat, and/or gaseous sterilization. State the biological indicator *D value* obtained under defined exposures to stated sterilization conditions using the Survival Curve Method of *D-value* analysis. State the *Survival time* and *kill time* for the biological indicator suspension under specified conditions on the label. The total viable spore count per mL of the suspension following heat shock treatment must also appear on the label. State in the labeling the strain and ATCC number of the microorganisms used in the spore suspension and instructions for spore recovery and for safe disposal of the suspension. Indicate in the labeling that the stated *D value* is reproducible only under the exact conditions determined by the manufacturer and that the user would not necessarily obtain the same results if different exposure conditions were used. State that the user should determine the suitability of the biological indicator spore suspension for the user's particular purpose and exposure conditions.

**Identification**—Identification for the biological indicator is of lesser importance than the more relevant concerns of population and resistance to the sterilization processes. The manufacturer should identify the species used.

**D value**—If the biological indicators are being used in moist-heat or dry-heat sterilization, proceed as directed for the relevant procedure in the section *D-Value Determination* under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the determined *D value* is within 20% of the labeled *D value* for the selected sterilizing conditions, and if the confidence limits of the estimate are within 10% of the determined *D value*. The *D-value* determination method used should be that identified by the biological indicator manufacturer.

**Survival time and kill time**—Follow the procedure under *Survival Time and Kill Time* in the section *D-Value Determination* under *Biological Indicators—Resistance Performance Tests* (55). The test is conducted using 1:100 dilution aliquots of the original suspension to inoculate carrier substrates that are most likely to be used by the purchaser of the spore suspensions for a given mode of sterilization. Following a total viable count analysis, the inoculated substrates are subjected to sterilization exposure conditions intended to indicate survival. The inoculated carriers must show evidence of growth among the exposed carriers. A second study is conducted to demonstrate the conditions necessary to result in total kill of the carriers. None of the carriers subjected to conditions designed to induce total kill should show growth. If for either the survival-time test or the kill-time test, not more than one carrier out of both groups fails the survival

or kill requirements, continue the corresponding test with four additional groups, each consisting of 10 carriers, according to the procedure described. For biological indicators for use with moist-heat or dry-heat sterilization, if all of the additional specimens subjected to the specific sterilization process either meet the survival requirements for the survival-time test or meet the kill requirement for the kill-time test, whichever is applicable, the requirements are met.

**Total viable spore count**—Proceed as directed for *Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions* in the section *Total Viable Spore Count* under *Biological Indicators—Resistance Performance Tests* (55). The requirements for this test are met if the total viable spore count within the suspension is within  $\pm 1$  log of the value stipulated by the manufacturer.

**Purity**—There is no evidence of contamination with other microorganisms following examination of spores recovered from the metal carriers using suitable plate-culture medium.

**Shipment**—Spore suspensions must be shipped following EPA requirements for the shipment of biological and/or etiological agents.

**Disposal**—Spore suspensions that a user or manufacturer wishes to dispose of are first sterilized by moist heat by a process that achieves temperatures of approximately 121° for not less than 30 minutes. Alternative sterilization methods yielding equivalent or greater levels of lethality may be used.

---

### Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Nonpaper Carriers

---

» Biological indicators for moist heat, dry heat, and gaseous modes of sterilization may be nonpaper carriers inoculated with a culture of viable spores derived from one of several sterilization-resistant microorganisms, based on the intended sterilization use. Cultures used for inoculation of carriers include, among others, *Clostridium sporogenes*, *Geobacillus stearothermophilus* (formerly *B. stearothermophilus*), *Bacillus atrophaeus* (formerly *B. subtilis*), or *Bacillus coagulans*. The carriers should be individually packaged for use either within the package or for use upon removal from the package as an unpackaged biological indicator. The packaged biological indicator on the carrier has a particular labeled spore count of not less than  $10^3$  and not more than  $10^9$  spores per carrier. It has a survival time and kill time appropriate to the labeled spore count and to the decimal reduction value (*D value*, in minutes), specified by:

*Survival time* (in minutes) = not less than (labeled *D value*)  $\times$  (log of labeled spore count per carrier – 2), and

*Kill time* (in minutes) = not more than (labeled *D value*)  $\times$  (log of labeled spore count per carrier + 4).

**Packaging and storage**—Preserve in the original package under the conditions recommended on the label, and protect the package from light, toxic substances, excessive heat, and high relative humidity or moisture. The packaging

or container materials do not adversely affect the performance of the article used as directed in the labeling.

**Expiration date**—The expiration date is determined on the basis of stability studies and is not more than 18 months from the date of manufacture. The date of manufacture is the date on which the first determination of the total viable count was made.

**Labeling**—Label the package or package insert to state that it is a biological indicator prepared on a carrier for use in label-specified applications for moist heat, dry heat, and/or gaseous sterilization. State the biological indicator *D value* obtained under defined exposures to stated sterilization conditions using the Survival Curve method, Spearman-Kärber method, or Stumbo-Murphy-Cochran method of *D value* analysis. State the survival time and kill time for the biological indicator carrier under specified conditions on the label. The total viable spore count per carrier following heat shock treatment must also appear on the label or package insert. State in the labeling the strain and ATCC number of the spore suspension used to inoculate the carriers and instructions for spore recovery and for safe disposal of the carriers. Indicate in the labeling that the stated *D value* is reproducible only under the exact conditions determined by the manufacturer and that the user would not necessarily obtain the same results if different exposure conditions were used. State that the user should determine the suitability of the carrier biological indicator for the user's particular purpose and exposure conditions.

**Identification**—Identification for the biological indicator is of less importance than the more relevant concerns of population and resistance to the sterilization processes. The manufacturer should identify the species used.

**D value**—Proceed as directed in the relevant procedure for *D Value Determination* under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the determined *D value* is within 20% of the labeled *D value* for the selected sterilizing conditions, and if the confidence limits of the estimate are within 10% of the determined *D value*. The *D-value* determination method used should be that identified by the biological indicator manufacturer.

**Survival time and kill time**—Follow the procedure in the subsection *Survival Time and Kill Time* in the section *D-Value Determination* under the chapter *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if all of the carriers subjected to sterilization exposure conditions intended to indicate survival show evidence of growth among the exposed carriers, while none of the carriers subjected to conditions designed to induce total kill show growth. If for either the survival test or the kill time test, not more than one carrier out of both groups fails the survival or kill requirements, continue the corresponding test with four additional groups, each consisting of 10 carriers, according to the procedure described. If all of the additional specimens subjected to the specific sterilization process either meet the survival requirements for the survival test time or meet the kill requirement for the kill test, whichever is applicable, the requirements are met.

**Total viable spore count**—Proceed as directed in the subsection *Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Nonpaper Carriers* in the section *Total Viable Spore Count* under the chapter *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the average number of viable spores per carrier are within –50% and +300% of the labeled count per carrier or within a lesser range that may be stated by the manufacturer.

**Purity**—There is no evidence of contamination with other microorganisms following examination of spores recovered from the carriers using a suitable plate culture medium.

**Disposal**—Prior to destruction or discarding the carriers, sterilize by moist heat sterilization to ensure that the carrier surface is exposed to 121° for not less than 30 minutes, or by an equivalent method recommended by the manufacturer.

---

## Biological Indicator for Steam Sterilization, Paper Carrier

---

» Biological Indicator for Steam Sterilization, Paper Carrier, is a defined preparation of viable spores made from a culture derived from a specified strain of *Bacillus stearothermophilus*, on a suitable grade of paper carrier, individually packaged in a suitable container readily penetrable by steam, and characterized for predictable resistance to steam sterilization. The packaged Biological Indicator for Steam Sterilization, Paper Carrier, has a particular labeled spore count per carrier of not less than  $10^4$  and not more than  $10^9$  spores. When labeled for and subjected to steam sterilization conditions at a particular temperature, it has a survival time and kill time appropriate to the labeled spore count and to the decimal reduction value (*D value*, in minutes) of the preparation, specified by:

*Survival time* (in minutes) = not less than (labeled *D value*)  $\times$  (log labeled spore count per carrier – 2); and

*Kill time* (in minutes) = not more than (labeled *D value*)  $\times$  (log labeled spore count per carrier + 4).

**Packaging and storage**—Preserve in the original package under the conditions recommended on the label, and protect it from light, toxic substances, excessive heat, and moisture. The packaging and container materials do not adversely affect the performance of the article used as directed in the labeling.

**Expiration date**—The expiration date is determined on the basis of stability studies and is not less than 18 months from the date of manufacture, the date of manufacture being the date on which the first determination of the total viable spore count was made.

**Labeling**—Label it to state that it is a Biological Indicator for Steam Sterilization, Paper Carrier; to indicate its *D value*, the method used to determine such *D value*, i.e., by spore count or fraction negative procedure after graded exposures to the sterilization conditions; the survival time and kill time under specified sterilization conditions stated on the label; its particular total viable spore count with a statement that such count has been determined after preliminary heat treatment; and its recommended storage conditions. State in the labeling the size of the paper carrier, the strain and ATCC number from which the spores were derived, and instructions for spore recovery and for safe disposal of the indicator. Indicate in the labeling that the stated *D value* is reproducible only under the exact conditions under which it was determined, that the user would not necessarily obtain the same result and that the user should determine the suitability of the biological indicator for the particular use.

**Identification**—The biological indicator organism complies substantially with the morphological, cultural, and biochemical characteristics of the strain of *Bacillus stearothermophilus*, ATCC No. 7953 or 12980, whichever is stated in the labeling: under microscopic examination it consists of Gram-positive rods with oval endospores in subterminally swollen cells; when incubated in nutrient broth for 17 hours and used to inoculate appropriate solid media, growth occurs when the inoculated media are incubated aerobically for 24 hours at 55° to 60°, and similar inoculated media incubated concomitantly at 30° to 35° show no evidence of growth in the same period. When examined under conventional biochemical tests for microbial characterization, it shows a delayed weak positive catalase reaction, it does not utilize citrate, propionate or hippurate, it reduces nitrate, but it does not liquefy gelatin, and it gives a negative result with the Voges-Proskauer test. Organisms derived from ATCC strain No. 7953 show negative egg yolk and starch hydrolysis reactions, while those derived from ATCC strain No. 12980 show positive reactions in both tests.

**Resistance performance tests—**

*D value*—Proceed as directed for the relevant procedure for *D Value* under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the determined *D value* is within 20% of the labeled *D value* for the selected sterilizing temperature, and if the confidence limits of the estimate are within 10% of the determined *D value*.

*Survival time and kill time*—Follow the procedure for *Survival Time and Kill Time* in the section *Steam Sterilization, Paper Carrier*, under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if all of the specimens subjected to the steam sterilization for the survival time show evidence of growth, while none of the specimens subjected to the steam sterilization for the kill time shows growth. If for either the survival time test or the kill time test, not more than 1 specimen out of both groups fails the survival requirement or the kill requirement (whichever is applicable), continue the corresponding test with 4 additional groups, each consisting of 20 specimens, according to the procedure described. If all of the additional specimens subjected to steam sterilization either meet the survival requirement for the survival time test or meet the kill requirement for the kill time test, whichever is applicable, the requirements of the test are met.

*Total viable spore count*—Proceed as directed for *Total Viable Spore Count* in the section *Steam Sterilization, Paper Carrier*, under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the tests are met if the log average number of viable spores per carrier is not less than 0.3 log of the labeled spore count per carrier and does not exceed the log labeled spore count per carrier by 0.48.

**Purity—**

*Presence of contamination by other microorganisms*—By examination of the spores on a suitable plate culture medium, there is no evidence of contamination with other microorganisms.

**Disposal**—Prior to destruction or discard, sterilize it by steam at 121° for not less than 30 minutes, or by not less than an equivalent method recommended by the manufacturer. This includes a test strip employed in any test procedures for the strips themselves.

---

## Biological Indicator for Steam Sterilization, Self-Contained

---

» Biological Indicator for Steam Sterilization, Self-Contained, is a Biological Indicator for Steam Sterilization, Paper Carrier individually packaged

in a suitable container readily penetrable by steam and designed to hold an appropriate bacteriological culture medium, so as to enable the packaged carrier, after subjection to saturated steam sterilization conditions, to be incubated in the supplied medium in a self-contained system. The supplied medium may contain a suitable indicator as a convenience for determining by a color change whether or not spores have survived. The design of the self-contained system is such that, after exposure to the specified sterilization conditions and inoculation of the medium under closed conditions as stated in the labeling, there is no loss of medium and inoculum during subsequent transport and handling, if done according to the provided instructions. The materials of which the self-contained system are made are such that there is no retention or release of any substance that may cause inhibition of growth of surviving spores under the incubation conditions stated in the labeling.

**Packaging and storage**—Preserve in the original package under the conditions recommended on the label, and protect from light, from substances that may adversely affect the contained microorganisms, from excessive heat, and from moisture.

**Expiration date**—The expiration date is determined on the basis of stability studies and is not less than 18 months from the date of manufacture, the date of manufacture being the date on which the first determination of the total viable spore count was made.

**Labeling**—Label it to state that it is a Biological Indicator for Steam Sterilization, Self-Contained; to indicate the *D value* of the self-contained system, the method used to determine such *D value* (i.e., by spore count or fraction negative procedure after graded exposures to the sterilization conditions); the survival time and kill time under the specified conditions stated on the label; its particular total viable spore count, with a statement that such count has been determined after preliminary heat treatment; and its recommended storage conditions. State on the labeling that the supplied bacteriological medium will meet requirements for growth-promoting ability, the strain and ATCC number from which the spores were derived, and the instructions for spore recovery and for safe disposal of the indicator unit. Also indicate in the labeling that the stated resistance characteristics are reproducible only under steam sterilization conditions at the stated temperature and only under the exact conditions under which it was determined, that the user would not necessarily obtain the same result, and that the user should determine the suitability of the biological indicator for the particular use.

**Identification**—It meets the requirements of the *Identification* test under *Biological Indicator for Steam Sterilization, Paper Carrier*.

**Resistance performance tests—**

*D value*—Proceed as directed for the relevant procedure for *D Value* under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the determined *D value* is within 20% of the labeled *D value* for the selected sterilizing temperature and if the confidence limits of the estimate are within 10% of the determined *D value*.

*Survival time and kill time*—Follow the procedure for *Survival Time and Kill Time* in the section *Steam Sterilization, Self-Contained*, under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if all of the specimens subjected to the steam sterilization for the

survival time show evidence of growth, while none of the specimens subjected to the steam sterilization for the kill time shows growth. If for either the survival time or the kill time requirement, not more than 1 specimen out of both groups fails the test, whichever is applicable, continue the corresponding test with 4 additional groups, each consisting of 10 specimens, according to the procedure described above. If all of the additional specimens subjected to steam sterilization either meet the survival requirement for the survival time test or meet the kill requirement for the kill time test, whichever is applicable, the requirements of the test are met.

**Total viable spore count**—Proceed as directed for *Total Viable Spore Count* under *Biological Indicators—Resistance Performance Tests* (55) using the procedure applicable to *Biological Indicator for Steam Sterilization, Paper Carrier*. The requirements of the test are met if the average number of viable spores per carrier is not less than 0.3 log of the labeled spore count per carrier and does not exceed the log labeled spore count per carrier by 0.48.

#### Medium suitability—

**Sterility**—Incubate 10 self-contained biological indicator systems at 55° to 60°, or at the optimal recovery temperature specified by the manufacturer, for 48 hours, making sure that there is no contact between the individual spore strips and the supplied medium. Examine the incubated medium visually (for change in color indicator or turbidity) and microscopically (for absence of microbial growth).

**Growth promotion of medium prior to sterilization treatment**—Submerge 10 self-contained units in a water bath maintained at 95° to 100° for 15 minutes. Start timing when the temperature of the container contents reach 95°. Cool rapidly in an ice-water bath (0° to 4°). Remove the units from the ice-water bath, submerge each spore strip with the self-contained medium, incubate at 55° to 60°, or at the optimal recovery temperature specified by the manufacturer, and examine visually after 48 hours for growth (for turbidity or change in color), and microscopically (for microbial growth). All the specimens under test show growth. If one or more of the specimens do not show growth, repeat the test with 20 additional units. The additional units all show growth.

**Growth promotion of medium after exposure to sterilization conditions**—Expose the specified number of units for both the *Survival Time* and *Kill time* stated in the labeling, as described in the section *Biological Indicator for Steam Sterilization, Self-Contained* under *Biological Indicators—Resistance Performance Tests* (55). Incubate the spore strips submerged in the self-contained medium according to the instructions of the manufacturer. At the end of the incubation period confirm the existence of growth in each of the specimens that were exposed for each *Survival time* and the absence of growth in each of the specimens that were exposed for each *Kill time* by visual inspection (turbidity or color indicator change) and by separate microscopic examination of each specimen and confirm, where applicable, correspondence of the labeled color to the appearance of growth in the supplied medium.

**Ability of medium to support growth after exposure to the sterilization conditions**—Take a stated number of units (e.g., 10) after they have been exposed for each *Kill time* stated in the labeling as directed in the preceding section. Aseptically remove and pool the medium from each unit. Prepare a suspension of the indicator microorganism as directed for *Total Viable Spore Counts* under *Biological Indicator for Steam Sterilization, Paper Carrier*. Prepare a dilution of that suspension so as to contain 100 to 1000 viable microorganisms in one mL. Inoculate the pooled medium with enough suspension to contain a total of 100 to 1000 microorganisms in a 10 mL aliquot of not more than the volume from 10 units

of the pooled medium. Incubate the inoculated pooled medium as directed for *Total Viable Spore Count*. Clear evidence of growth is obtained within 7 days.

**Disposal**—Prior to destruction or discard, sterilize it by steam at 121° for not less than 30 minutes, or by not less than an equivalent method recommended by the manufacturer. This includes test strips employed in any test procedures for the strips themselves.

## Biotin

$C_{10}H_{16}N_2O_3S$  244.31  
 1*H*-Thieno[3,4-*d*]imidazole-4-pentanoic acid, hexahydro-2-oxo-, [3*aS*-(3*αα*,4*β*,6*αα*)]-;  
 (3*aS*,4*S*,6*aR*)-Hexahydro-2-oxo-1*H*-thieno[3,4-*d*]imidazole-4-valeric acid [58-85-5].

### DEFINITION

Biotin contains NLT 97.5% and NMT 100.5% of biotin ( $C_{10}H_{16}N_2O_3S$ ).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

**B.** It meets the requirements in *Specific Tests for Optical Rotation, Specific Rotation* (781S).

**C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Buffer solution:** Dissolve 1 g of sodium perchlorate monohydrate in 500 mL of water, add 1 mL of phosphoric acid, and dilute with water to 1000 mL.

**Mobile phase:** Acetonitrile and *Buffer solution* (8.5: 91.5)

**Diluent:** Acetonitrile and water (1:4)

**Standard solution:** 0.1 mg/mL of USP Biotin RS in *Diluent*. Sonicate if necessary to dissolve.

**Sample solution:** 0.1 mg/mL of Biotin in *Diluent*. Sonicate if necessary to dissolve.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 200 nm

**Column:** 4.6-mm × 15-cm; 3-μm packing L7

**Flow rate:** 1.2 mL/min

**Injection size:** 50 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0% for replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of biotin ( $C_{10}H_{16}N_2O_3S$ ) in the portion of Biotin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

- $C_S$  = concentration of USP Biotin RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Biotin in the *Sample solution* (mg/mL)

Acceptance criteria: 97.5%–100.5%

## IMPURITIES

### • RELATED COMPOUNDS

Buffer solution, Mobile phase, Diluent, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

#### Analysis

Sample: *Sample solution*

Measure the peak responses of the *Sample solution*. Calculate the percentage of each impurity in the portion of Biotin taken:

$$\text{Result} = (r_U/r_T) \times 100$$

- $r_U$  = peak response of each impurity from the *Sample solution*  
 $r_T$  = sum of the peak responses of all the peaks from the *Sample solution*

#### Acceptance criteria

Individual impurity: NMT 1.0%

Total impurities: NMT 2.0%

## SPECIFIC TESTS

### • OPTICAL ROTATION, *Specific Rotation* (781S)

Sample solution: 20 mg/mL in 0.1 N sodium hydroxide

Acceptance criteria: +89° to +93°

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Store in tight containers.
- **USP REFERENCE STANDARDS** (11)  
USP Biotin RS

## Biperiden

$C_{21}H_{29}NO$  311.46

1-Piperidinepropanol,  $\alpha$ -bicyclo[2.2.1]hept-5-en-2-yl- $\alpha$ -phenyl-

$\alpha$ -5-Norbornen-2-yl- $\alpha$ -phenyl-1-piperidinepropanol [514-65-8].

» Biperiden contains not less than 98.0 percent and not more than 101.0 percent of  $C_{21}H_{29}NO$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

### USP Reference standards (11)—

USP Biperiden RS

#### Identification—

A: *Infrared Absorption* (197K).

B: *Ultraviolet Absorption* (197U)—

Solution: 900  $\mu$ g per mL. Transfer about 180 mg of it, accurately weighed, to a 200-mL volumetric flask, add 1 mL of lactic acid, dilute with water to volume, and mix. Absorptivities, at about 257 nm, calculated on the dried basis, do not differ by more than 3.0%.

C: Dissolve about 20 mg in 5 mL of phosphoric acid: a green color is produced.

D: Dissolve 200 mg in 80 mL of water with the aid of 0.5 mL of 3 N hydrochloric acid, warming, if necessary, to effect solution, and then cool. To 5 mL of the solution add 1 drop of hydrochloric acid and several drops of mercuric chloride TS: a white precipitate is formed. To a second 5-mL portion of the solution add bromine TS dropwise: a yellow precipitate forms which redissolves on shaking, and finally, upon the addition of more bromine TS, a permanent precipitate is formed.

**Melting range**, *Class I* (741): between 112° and 116°.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

#### Ordinary impurities (466)—

Test solution: methanol.

Standard solution: methanol.

Eluant: a mixture of methanol and ammonium hydroxide (100:1.5).

Visualization: 17.

**Assay**—Dissolve about 500 mg of Biperiden, accurately weighed, in 20 mL of benzene, add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 31.15 mg of  $C_{21}H_{29}NO$ .

## Biperiden Hydrochloride

$C_{21}H_{29}NO \cdot HCl$  347.92

1-Piperidinepropanol,  $\alpha$ -bicyclo[2.2.1]hept-5-en-2-yl- $\alpha$ -phenyl-, hydrochloride.

$\alpha$ -5-Norbornen-2-yl- $\alpha$ -phenyl-1-piperidinepropanol hydrochloride [1235-82-1].

» Biperiden Hydrochloride contains not less than 98.0 percent and not more than 101.0 percent of  $C_{21}H_{29}NO \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

### USP Reference standards (11)—

USP Biperiden Hydrochloride RS

#### Identification—

A: *Infrared Absorption* (197K).

B: *Ultraviolet Absorption* (197U)—

Solution: 1 mg per mL.

Medium: methanol.

Absorptivities at 257 nm, calculated on the dried basis, do not differ by more than 3.0%.

C: Dissolve about 20 mg in 5 mL of phosphoric acid: a green color is produced.

D: To 5 mL of a solution (1 in 500) add bromine TS dropwise: a yellow precipitate, which dissolves on shaking, is formed. Addition of more bromine TS produces a precipitate that does not dissolve on shaking.

E: A 5-mL portion of a solution (1 in 500) responds to the tests for *Chloride* (191).

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Ordinary impurities** (466)—

*Test solution:* methanol.

*Standard solution:* methanol.

*Eluant:* a mixture of methanol and ammonium hydroxide (100:1.5).

*Visualization:* 17.

**Assay**—Accurately weigh about 500 mg of Biperiden Hydrochloride, and dissolve in 80 mL of glacial acetic acid, warming slightly, if necessary, to effect solution. Cool, add 1 drop of crystal violet TS and 10 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 34.79 mg of  $C_{21}H_{29}NO \cdot HCl$ .

## Biperiden Hydrochloride Tablets

**DEFINITION**

Biperiden Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of  $C_{21}H_{29}NO \cdot HCl$ .

**IDENTIFICATION**

- THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

**Standard solution:** Dissolve 10 mg of USP Biperiden Hydrochloride RS in 5 mL of water, mix, and sonicate to disperse the powder. Add 5 mL of methanol to the flask, mix, and sonicate for 15 min. Filter the solution into a separator, add 2 mL of 1 N sodium hydroxide and 10 mL of chloroform, and shake for 3 min. Filter the chloroform layer into a stoppered flask, and use the chloroform filtrate.

**Sample solution:** To a quantity of finely powdered Tablets, equivalent to 10 mg of biperiden hydrochloride, add 5 mL of water, mix, and sonicate to disperse the powder. Add 5 mL of methanol to the flask, mix, and sonicate for 15 min. Filter the solution into a separator, add 2 mL of 1 N sodium hydroxide and 10 mL of chloroform, and shake for 3 min. Filter the chloroform layer into a stoppered flask, and use the chloroform filtrate.

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture. Condition by heating the plate at 105° for 1 h and allowing to cool.

**Application volume:** 20  $\mu$ L

**Developing solvent system:** Methanol and ammonium hydroxide (100:1.5)

**Visualization:** Iodine vapor, 10 min

**Analysis:** Separately apply the *Sample solution* and the *Standard solution* to the chromatographic plate. Allow the applications to dry, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by exposing the plate for 10 min to iodine vapors in a preequilibrated closed chamber, on the bottom of which there are iodine crystals.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

**ASSAY**

- PROCEDURE**

**Solution A:** 38 g/L of monobasic sodium phosphate and 2 g/L of anhydrous dibasic sodium phosphate in water. Adjust to a pH of  $5.3 \pm 0.1$ , if necessary.

**Solution B:** Dissolve 400 mg of bromocresol purple in 30 mL of water, add 6.3 mL of 0.1 N sodium hydroxide, and dilute with water to 500 mL.

**Phosphate buffer–bromocresol purple solution:** Mix equal volumes of *Solution A*, *Solution B*, and chloroform, shake in a separator, and discard the chloroform. If ap-

preciable color is extracted, repeat with additional portions of chloroform until no color is extracted.

**Standard stock solution:** 0.8 mg/mL of USP Biperiden Hydrochloride RS in methanol

**Standard solution:** 40  $\mu$ g/mL of USP Biperiden Hydrochloride RS, prepared as follows: Transfer a suitable volume of *Standard stock solution* to a suitable volumetric flask, add 25% of the flask volume of water, and dilute with methanol to volume.

**Sample solution:** Nominal concentration of 40  $\mu$ g/mL of biperiden hydrochloride from NLT 20 Tablets, prepared as follows: Transfer a portion of finely powdered Tablets, to obtain the final nominal concentration, to a suitable volumetric flask; add 25% of the volume of water; and heat on a steam bath for 15 min. Cool, and dilute with methanol to volume.

**Blank:** Methanol and water (3:1)

**Analysis**

**Samples:** *Standard solution*, *Sample solution*, and *Blank* Transfer 5.0 mL each of the *Standard solution*, the *Sample solution*, and the *Blank* to individual separators, each containing 10.0 mL of *Phosphate buffer–bromocresol purple solution*. Extract the solution in each separator with 20.0 mL of chloroform for 2 min. After the layers have separated, pass each chloroform extract through filter paper (Whatman No. 31 or equivalent) into separate glass-stoppered, 50-mL volumetric flasks. In the same manner, extract the solution in each separator with another 20.0-mL portion of chloroform, filter, and wash each filter with 8 mL of chloroform, collecting each combined filtrate and washing, respectively, in the 50-mL volumetric flask containing the first extract. Dilute each with chloroform to volume. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 408 nm, with a suitable spectrophotometer, using the *Blank* to set the instrument.

Calculate the percentage of the label claim of  $C_{21}H_{29}NO \cdot HCl$  in the Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Biperiden Hydrochloride RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of the *Sample solution* ( $\mu$ g/mL)

**Acceptance criteria:** 93.0%–107.0%

**PERFORMANCE TESTS**

- DISSOLUTION (711)**

**Medium:** 0.01 N hydrochloric acid; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

[NOTE—Determine the amount of  $C_{21}H_{29}NO \cdot HCl$  dissolved by using the following method.]

**Phosphate buffer–bromocresol purple solution:** Prepare as directed in the Assay.

**Standard stock solution:** 0.8 mg/mL of USP Biperiden Hydrochloride RS in methanol

**Standard solution:** 2  $\mu$ g/mL of USP Biperiden Hydrochloride RS, prepared as follows: Pipet 5 mL of *Standard stock solution* into a 500-mL volumetric flask, and add 0.01 N hydrochloric acid to volume. Pipet 25 mL of this solution into a suitable beaker, and adjust with 0.01 N sodium hydroxide to a pH of 5.3. Transfer this solution to a 100-mL volumetric flask with the aid of water, and dilute with water to volume.

**Sample solution:** Sample per *Dissolution (711)*. Filter 75 mL of the solution under test, pipet 50 mL of the clear filtrate into a suitable beaker, and adjust with 0.01 N sodium hydroxide to a pH of 5.3. Transfer this solu-

tion to a 100-mL volumetric flask with the aid of water, and dilute with water to volume.

**Blank:** Water

**Analysis**

**Samples:** *Standard solution*, *Sample solution*, and *Blank*  
Pipet 20.0 mL each of the *Standard solution*, the *Sample solution*, and the *Blank* into individual separators, each containing 10.0 mL of *Phosphate buffer–bromocresol purple solution*. Extract the solution in each separator with 40.0 mL of chloroform for 10 min. After the layers have separated, pass each chloroform extract through filter paper into separate, glass-stoppered containers, discarding the first 10 mL of each filtrate. Determine the amount of  $C_{21}H_{29}NO \cdot HCl$  dissolved from absorbances at the wavelength of maximum absorbance at about 408 nm (10-cm cells) of the extract from the *Sample solution* in comparison with that of the extract from the *Standard solution*, using the *Blank* to set the instrument.

**Tolerances:** NLT 75% (Q) of  $C_{21}H_{29}NO \cdot HCl$  is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**  
USP Biperiden Hydrochloride RS

## Biperiden Lactate Injection

$C_{21}H_{29}NO \cdot C_3H_6O_3$  401.54

1-Piperidinepropanol,  $\alpha$ -bicyclo[2.2.1]hept-5-en-2-yl- $\alpha$ -phenyl-, compd. with 2-hydroxypropanoic acid (1:1).  
 $\alpha$ -5-Norbornen-2-yl- $\alpha$ -phenyl-1-piperidinepropanol lactate (salt) [7085-45-2].

» Biperiden Lactate Injection is a sterile solution of biperiden lactate ( $C_{21}H_{29}NO \cdot C_3H_6O_3$ ) in Water for Injection, prepared from Biperiden with the aid of Lactic Acid. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_{21}H_{29}NO \cdot C_3H_6O_3$ .

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards (11)**—

USP Biperiden RS  
USP Endotoxin RS

**Identification**—Using a volume of Injection, equivalent to about 50 mg of biperiden lactate, and using a solution of 50 mg of USP Biperiden RS in 25 mL of 0.01 N hydrochloric acid, proceed as directed under *Identification—Organic Nitrogenous Bases* (181), beginning with “Transfer the liquid to a separator”: the Injection meets the requirements of the test.

**Bacterial endotoxins (85)**—It contains not more than 83.3 USP Endotoxin Units per mg of biperiden lactate.

**pH (791):** between 4.8 and 5.8.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Phosphate buffer–bromocresol purple solution*—Prepare as directed in the Assay under *Biperiden Hydrochloride Tablets*.

*Standard preparation*—Transfer about 80 mg of USP Biperiden RS, accurately weighed, to a 100-mL volumetric flask, add methanol to volume, and mix. Transfer 5.0 mL of this solution to a second 100-mL volumetric flask, add 25 mL of water, dilute with methanol to volume, and mix to

obtain a *Standard preparation* having a known concentration of about 40  $\mu$ g per mL.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 5 mg of biperiden lactate, to a 100-mL volumetric flask, add 25 mL of water, dilute with methanol to volume, and mix.

*Procedure*—Proceed as directed in the Assay under *Biperiden Hydrochloride Tablets*. Calculate the quantity, in mg, of  $C_{21}H_{29}NO \cdot C_3H_6O_3$  in each mL of the Injection taken by the formula:

$$(401.55 / 311.47)(0.1C / V)(A_U / A_S)$$

in which 401.55 and 311.47 are the molecular weights of biperiden lactate and biperiden, respectively; C is the concentration, in  $\mu$ g per mL, of USP Biperiden RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Bisacodyl

$C_{22}H_{19}NO_4$  361.39  
Phenol, 4,4'-(2-pyridinylmethylene)bis-, diacetate (ester);  
4,4'-(2-Pyridylmethylene)diphenol diacetate (ester);  
4,4'-(Pyridin-2-ylmethylene)diphenyl diacetate [603-50-9].

**DEFINITION**

Bisacodyl contains NLT 98.0% and NMT 101.0% of  $C_{22}H_{19}NO_4$ , calculated on the dried basis. **[CAUTION—**Avoid inhalation and contact with the eyes, skin, and mucous membranes.]

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197S)**

Cell: 1.0 mm

**Sample solution:** 5 mg/mL in chloroform, previously dried

- **B.** The retention time of the major peak in the *Sample solution* corresponds to that of the *Standard stock solution*, as obtained under *Organic Impurities*.

**ASSAY**

- **PROCEDURE**

**Sample solution:** Dissolve 300 mg of Bisacodyl in 60 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 36.14 mg of  $C_{22}H_{19}NO_4$ .

**Acceptance criteria:** 98.0%–101.0% on the dried basis

**IMPURITIES**

- **RESIDUE ON IGNITION (281):** NMT 0.1%
- **HEAVY METALS (231), Method II:** NMT 10 ppm
- **ORGANIC IMPURITIES**

**Buffer:** 1.58 g/L of ammonium formate in water, adjusted with formic acid to a pH of 5.0

**Mobile phase:** Acetonitrile and *Buffer* (45:55)

**Diluent:** Acetonitrile and water (35:5)

**Standard stock solution:** 1.0 mg/mL of USP Bisacodyl RS in *Diluent*

**Standard solution:** 1.0  $\mu$ g/mL of USP Bisacodyl RS in *Diluent*

**System suitability solution:** 0.8 mg/mL of USP Bisacodyl RS; 2 µg/mL each of USP Bisacodyl Related Compounds A, C, and E RS; and 4 µg/mL of USP Bisacodyl Related Compound B RS in *Diluent*

**Sample solution:** 1.0 mg/mL of Bisacodyl in *Diluent*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 265 nm

**Column:** 4.6-mm × 25-cm; 4-µm or 5-µm packing L1

**Flow rate:** 1.5 mL/min

**Run time:** 3.5 times the retention time of bisacodyl

**Injection size:** 20 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*. [NOTE—See *Table 1* for the relative retention times.]

#### Suitability requirements

**Relative standard deviation:** NMT 5.0% for the bisacodyl peak, *Standard solution*

**Tailing factor:** NMT 2.0 for the bisacodyl peak, *System suitability solution*

**Resolution:** NLT 1.5 between the bisacodyl related compound E and bisacodyl peaks, *System suitability solution*

#### Analysis

**Samples:** *Standard stock solution*, *Standard solution*, and *Sample solution*

[NOTE—Chromatograph the *Standard stock solution* to perform *Identification* test B.]

Calculate the percentage of any individual impurity in the portion of Bisacodyl taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of bisacodyl from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 1*)

**Acceptance criteria:** See *Table 1*. [NOTE—The reporting level for impurities is 0.05%.]

**Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Bisacodyl related compound A <sup>a</sup>	0.20	1.7	0.15
Bisacodyl related compound B <sup>b</sup>	0.40	1.5	0.15
Bisacodyl related compound C <sup>c</sup>	0.45	1.3	0.50
Specified unidentified impurity 1	0.85	1.0	0.20
Bisacodyl related compound E <sup>d</sup>	0.90	1.0	0.50
Bisacodyl	1.0	—	—
Specified unidentified impurity 2	2.6	1.0	0.30

<sup>a</sup> 4,4'-Diphenol impurity.

<sup>b</sup> 2,4'-Diphenol impurity.

<sup>c</sup> Monoacetyl bisacodyl.

<sup>d</sup> 2,4'-Bisacodyl analog.

**Table 1** (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Any individual unspecified impurity	—	1.0	0.10
Total impurities	—	—	1.0

<sup>a</sup> 4,4'-Diphenol impurity.

<sup>b</sup> 2,4'-Diphenol impurity.

<sup>c</sup> Monoacetyl bisacodyl.

<sup>d</sup> 2,4'-Bisacodyl analog.

#### SPECIFIC TESTS

- **Loss on Drying** (731): Dry a sample at 105° for 2 h: it loses NMT 0.5% of its weight.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light. Store at room temperature.

#### • USP REFERENCE STANDARDS <11>

USP Bisacodyl RS

USP Bisacodyl Related Compound A RS

4,4'-(Pyridin-2-ylmethylene)diphenol.

C<sub>18</sub>H<sub>15</sub>NO<sub>2</sub> 277.32

USP Bisacodyl Related Compound B RS

2,4'-(Pyridin-2-ylmethylene)diphenol.

## Bisacodyl Suppositories

» Bisacodyl Suppositories contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>22</sub>H<sub>19</sub>NO<sub>4</sub>.

**Packaging and storage**—Preserve in well-closed containers at a temperature not exceeding 30°.

#### USP Reference standards <11>—

USP Bisacodyl RS

#### Identification—

**A:** Transfer a quantity of Suppositories, equivalent to about 150 mg of bisacodyl, to a 500-mL conical flask, add 75 mL of solvent hexane, and heat on a steam bath until they are melted. Filter the solution, with the aid of vacuum, through a medium-porosity, sintered-glass funnel, and wash the residue with about 100 mL of warm solvent hexane until it is free from fat. Continue the vacuum until the residue appears dry. Dissolve the residue by rinsing the filter with about 50 mL of warm acetone, collecting the filtrate in a 150-mL beaker, and evaporate the filtrate on a steam bath to a volume of about 5 mL. To the residual liquid add about 75 mL of water, heat on a steam bath for 15 minutes, and cool. Scratch the sides of the beaker to induce crystallization, filter the crystals, and dry at 100° for about 15 minutes: the bisacodyl so obtained melts between 129° and 135°, and responds to *Identification* test A under *Bisacodyl*.

**B:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for bisacodyl, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation*.

**Assay—**

**Mobile phase**—Prepare a filtered and degassed mixture of 0.074 M sodium acetate in water [adjusted with 2.5% (v/v) acetic acid to a pH of 7.4] and acetonitrile (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Bisacodyl RS in acetonitrile to obtain a *Standard preparation* having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Transfer a number of Suppositories, equivalent to about 100 mg of bisacodyl, to a 500-mL separator, add 150 mL of *n*-hexane, and shake until all the suppositories are dissolved. Add 50 mL of acetonitrile, shake for 1 minute, and allow the layers to separate. Drain the lower layer into a 200-mL volumetric flask, and extract the *n*-hexane layer remaining in the separator with two 50-mL portions of acetonitrile, combining the lower layers in the volumetric flask. Dilute the combined extracts in the volumetric flask with acetonitrile to volume, mix, and filter.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 265-nm detector, a 3.9-mm × 30-cm column that contains packing L1, and a guard column that contains packing L2. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>22</sub>H<sub>19</sub>NO<sub>4</sub> in the Suppositories taken by the formula:

$$200C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Bisacodyl RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bisacodyl Rectal Suspension

» Bisacodyl Rectal Suspension is a suspension of Bisacodyl in a suitable aqueous medium. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of C<sub>22</sub>H<sub>19</sub>NO<sub>4</sub>.

**Packaging and storage**—Preserve in unit-dose containers at a temperature not exceeding 30°.

**USP Reference standards** <11>—

USP Bisacodyl RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

**pH** <791>: between 5.0 and 6.8.

**Assay—**

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and 0.01 M monobasic potassium phosphate (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Internal standard solution**—Dissolve a suitable quantity of ethylparaben in methanol, and dilute with an equal volume of water to obtain a solution containing about 5.0 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Bisacodyl RS in methanol, add an accurately measured volume of *Internal standard solution*, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having known concentrations of about 67 µg per mL and 250 µg per mL for bisacodyl and ethylparaben, respectively.

**Assay preparation**—Transfer an accurately measured volume of Rectal Suspension, equivalent to 6.7 mg of bisacodyl, to a 100-mL volumetric flask. Add 5.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 2.0 for bisacodyl and 1.0 for ethylparaben; the resolution, *R<sub>s</sub>*, between bisacodyl and the internal standard is not less than 7.0; the column efficiency, determined for the analyte peak, is not less than 2000 theoretical plates; the tailing factor is not more than 1.2; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>22</sub>H<sub>19</sub>NO<sub>4</sub> in the portion of Rectal Suspension taken by the formula:

$$100C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Bisacodyl RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios of the bisacodyl peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bisacodyl Delayed-Release Tablets

» Bisacodyl Delayed-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>22</sub>H<sub>19</sub>NO<sub>4</sub>. Bisacodyl Delayed-Release Tablets are enteric coated.

**Packaging and storage**—Preserve in well-closed containers at a temperature not exceeding 30°.

**Labeling**—Label the Tablets to indicate that they are enteric coated.

**USP Reference standards** <11>—

USP Bisacodyl RS

**Identification—**

**A:** Macerate a portion of powdered Tablets, equivalent to about 300 mg of bisacodyl, with 100 mL of acetone. Heat on a steam bath to boiling, filter, and evaporate to about 20 mL. Add 200 mL of water, and warm the mixture on the steam bath, passing a stream of nitrogen over the surface to evaporate the acetone. After 30 minutes, cool the mixture, and filter through a sintered-glass funnel. Discard the filtrate, and dissolve the crystals in 50 mL of acetone. Evaporate the solution to about 15 mL, add about 75 mL of water, heat on a steam bath for 15 minutes, and then cool. Scratch the sides of the beaker to induce crystallization, filter the crystals, and dry at 100° for about 15 minutes: the bisacodyl so obtained responds to *Identification* test A under *Bisacodyl*.

**B:** The retention time of the major peak for bisacodyl in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Disintegration** (701)—Proceed as directed for *Delayed-Release (enteric coated) Tablets*: the tablets do not disintegrate after 1 hour of agitation in simulated gastric fluid TS, but then disintegrate within 45 minutes in simulated intestinal fluid TS.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Bisacodyl Suppositories*.

*Assay preparation*—Transfer an accurately weighed portion of finely powdered Tablets, equivalent to 100 mg of bisacodyl, to a 200-mL volumetric flask, add 25 mL of water, and shake by mechanical means for 15 minutes followed by sonication for 15 minutes. Add 100 mL of acetonitrile, and shake by mechanical means for 15 minutes followed by sonication for 15 minutes. Dilute with acetonitrile to volume, mix, and filter.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{22}H_{19}NO_4$  in the Tablets taken by the formula:

$$200C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Bisacodyl RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Milk of Bismuth

» Milk of Bismuth contains bismuth hydroxide and Bismuth Subcarbonate in suspension in water, and yields not less than 5.2 percent and not more than 5.8 percent (w/w) of bismuth trioxide ( $Bi_2O_3$ ).

Bismuth Subnitrate . . . . .	80 g
Nitric Acid . . . . .	120 mL
Ammonium Carbonate . . . . .	10 g
Strong Ammonia Solution,	
Purified Water, each, a sufficient	
quantity, to make . . . . .	1000 mL

Mix the Bismuth Subnitrate with 60 mL of Purified Water and 60 mL of the Nitric Acid in a suitable container, and agitate, warming gently until solution is effected. Pour this solution, with constant stirring, into 5000 mL of Purified Water containing 60 mL of the Nitric Acid. Dilute 160 mL of

Strong Ammonia Solution with 4300 mL of Purified Water in a glazed or glass vessel of at least 12,000-mL capacity. Dissolve the Ammonium Carbonate in this solution, and then pour the bismuth solution quickly into it with constant stirring. Add sufficient 6 N ammonium hydroxide, if necessary, to render the mixture distinctly alkaline, allow to stand until the precipitate has settled, then pour or siphon off the supernatant, and wash the precipitate twice with Purified Water, by decantation. Transfer the magma to a strainer of close texture, so as to provide continuous washing with Purified Water, the outlet tube being elevated to prevent the surface of the magma from becoming dry. When the washings no longer yield a pink color with phenolphthalein TS, drain the moist preparation, transfer to a graduated vessel, add sufficient Purified Water to make 1000 mL, and mix.

NOTE—This method of preparation may be varied, provided the product meets the following requirements.

**Packaging and storage**—Preserve in tight containers, and protect from freezing.

#### Identification—

**A:** It responds to the tests for *Bismuth* (191) and for *Carbonate* (191).

**B:** Add 1 mL of 3 N hydrochloric acid to 1 mL of Milk of Bismuth: a clear solution is produced. Pour the clear solution into 10 volumes of water: a white precipitate is formed.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—The total bacterial count does not exceed 100 cfu per mL and the test for *Escherichia coli* is negative.

**Water-soluble substances**—Boil 10 mL with 90 mL of water for 10 minutes, cool, add water to make the total volume 100 mL, mix, and filter. Evaporate 50 mL of the filtrate to dryness, and ignite it gently: the weight of the residue does not exceed 5 mg (0.1%).

**Arsenic, Method I** (211)—Evaporate 3.75 mL on a steam bath to dryness, add 2 mL of sulfuric acid, and heat until copious fumes of sulfur trioxide are evolved. The limit is 0.8 ppm.

**Lead**—To 5 mL add warm nitric acid, dropwise, until it is just dissolved, and pour the solution into 50 mL of water: a white precipitate may form. Filter, if necessary, evaporate the filtrate on a steam bath to 15 mL, again filter, and to 10 mL of the filtrate add an equal volume of 2 N sulfuric acid: no precipitate is formed.

**Limit of alkalies and alkaline earths**—Dissolve 2.0 mL in 5 mL of hydrochloric acid, dilute with water to 100 mL, add hydrogen sulfide to precipitate the bismuth completely, and filter. To 50 mL of the clear filtrate add 5 drops of sulfuric acid, evaporate to dryness, and ignite: the weight of the residue does not exceed 3 mg (0.3%).

**Assay**—Evaporate an accurately weighed quantity of Milk of Bismuth to dryness, and ignite the residue to constant weight. From the weight of the  $Bi_2O_3$  so obtained determine the percentage in the assay specimen.

## Bismuth Citrate

$\text{BiC}_6\text{H}_5\text{O}_7$  398.08 [813-93-4].

» Bismuth Citrate contains not less than 49 percent and not more than 54 percent of bismuth (Bi).

**Packaging and storage**—Preserve in tight, light-resistant containers, store at controlled room temperature, and prevent exposure to excessive heat.

**USP Reference standards** (11)—  
USP Bismuth Citrate RS

### Identification—

**A:** *Infrared Absorption* (197K): on the undried specimen.

**B:** When strongly heated, the salt chars, and on ignition leaves a more or less blackened residue having a yellow surface. The residue is soluble in warm nitric acid, and this solution, when dropped into a large excess of water, produces a white turbidity.

**C:** Dissolve 1 g in ammonia TS. When treated with hydrogen sulfide in excess, a black precipitate is obtained. Filter this mixture, drive off the excess hydrogen sulfide by heating, and allow to cool. To a portion of this cooled solution add an excess of calcium hydroxide TS, and boil: a white precipitate is formed. Reserve a second portion of the cooled solution for the test for *Limit of nitrate*.

**Arsenic, Method I** (211)—Prepare the *Test Preparation* as follows. Triturate 300 mg with an equal weight of calcium hydroxide, and ignite. Dissolve the residue in 5 mL of 3 N hydrochloric acid: the limit is 10 µg per g.

**Limit of nitrate**—To the second portion of cooled solution reserved from *Identification* test C, add an equal volume of sulfuric acid, mix, and allow to cool. Into the liquid, drop a crystal of ferrous sulfate, and allow to stand for 30 minutes: no brown or brownish black color appears around the crystal.

### Limit of copper, lead, and silver—

**Standard solution**—Prepare a solution containing 1000 µg of copper per mL, a solution containing 1000 µg of lead per mL, and a solution containing 1000 µg of silver per mL. Transfer 3.0 mL of each solution to a 2000-mL volumetric flask, dilute with 1 N nitric acid to volume, and mix. [NOTE—The concentrations of copper, lead, and silver in this solution may be modified by using a different quantity or by further dilution to bring the absorption responses within the working range of the atomic absorption spectrophotometer.]

**Test solution**—Ignite about 3 g of Bismuth Citrate, accurately weighed, in a porcelain crucible, cool, and cautiously add 6 N nitric acid to dissolve the residue. Add 100 mL of water, and mix. A white precipitate forms. Filter this mixture, evaporate on a steam bath to obtain about 15 mL of solution, and filter again. Dilute the filtrate with water to 20.0 mL.

**Procedure**—Concomitantly determine the absorbances of the *Standard solution* and the *Test solution* at the emission lines of 324.7 nm, 217 nm, and 328.1 nm for copper, lead, and silver, respectively, with an atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with copper, lead, and silver hollow-cathode lamps and an oxidizing flame. The absorbances of the *Test solution* do not exceed those of the *Standard solution* for each element (10 µg per g).

### Limit of soluble bismuth—

**Standard solution**—Transfer 242.0 mg of bismuth nitrate pentahydrate to a 100-mL volumetric flask. Add 3 mL of 1.5 N nitric acid, swirl to dissolve, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 500-mL volumetric flask, add 250 mL of 1.5 N nitric acid, dilute with water to volume, and mix. This solution contains 2.0 µg of bismuth (Bi) per mL. [NOTE—The concentration of bismuth in this solution may be modified by using a different quantity or by further dilution to bring the absorption responses within the working range of the atomic absorption spectrophotometer.]

**Test solution**—Prepare a mixture of 5.0 g of Bismuth Citrate and 100 mL of water, and stir by mechanical means the suspension thus obtained for 2 hours. Pass through filter paper. Pass the filtrate thus obtained through a filter having a 0.1-µm or finer porosity. To 10.0 mL of the filtrate add 0.1 mL of nitric acid.

**Procedure**—Concomitantly determine the absorbances of the *Standard solution* and the *Test solution* at the emission line of 223.06 nm for bismuth with an atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a bismuth hollow-cathode lamp and an oxidizing flame. The absorbances of the *Test solution* do not exceed those of the *Standard solution* (40 µg per g).

**Assay**—Transfer about 300 mg of Bismuth Citrate, accurately weighed, to a porcelain crucible, and ignite. Allow to cool, add 2 mL of nitric acid to the residue, dropwise, and warm until complete solution has been effected. Add about 60 mL of water and 0.3 mL of xylenol orange TS, and titrate with 0.05 N edetate disodium VS to a yellow endpoint. Each mL of 0.05 N edetate disodium is equivalent to 10.45 mg of bismuth (Bi).

## Bismuth Subcarbonate

» Bismuth Subcarbonate contains not less than 97.6 percent and not more than 100.7 percent of  $(\text{BiO})_2\text{CO}_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, protected from light.

**Identification**—It responds to the tests for *Bismuth* (191) and for *Carbonate* (191).

**Loss on drying** (731)—Dry it at 105° to constant weight: it loses not more than 1.0% of its weight.

**Chloride** (221)—Mix 5.0 g of it with 10 mL of water, add 20 mL of nitric acid, warm to achieve dissolution, allow to cool, and dilute with water to obtain 100 mL of solution. To 6.6 mL of this stock solution add 4 mL of nitric acid, and dilute with water to obtain 50 mL of solution. A 15.0-mL portion of this test solution shows no more chloride than corresponds to 70 µL of 0.020 N hydrochloric acid (0.05%).

**Limit of alkalis and alkaline earths**—Boil 1.0 g of it with 20 mL of a mixture of acetic acid and water (1:1). After 2 minutes, cool and filter. Collect the filtrate, wash the residue with 20 mL of water, and add the washing to the filtrate. To this solution add 2 mL of 2 N hydrochloric acid and 20 mL of water. Heat to boiling and precipitate the bismuth by adding hydrogen sulfide. Cool the mixture, and filter. Collect the filtrate, wash the residue with water, and add the washing to the filtrate. Evaporate this solution to dryness on a water bath. To the residue add 0.5 mL of sulfuric acid, dry slowly, and cool: the weight of the residue does not exceed 10 mg (1.0%).

### Limit of nitrate—

**Indigo carmine titrant**—Dissolve 4 g of indigo carmine in 900 mL of water, add 2 mL of sulfuric acid, and dilute with water to 1000 mL.

**Standard solution**—Prepare a solution of potassium nitrate in water containing 0.0815 mg per mL (equivalent to 0.05 mg of nitrate per mL). Add 20.0 mL of this solution to a 125-mL conical flask (*Standard solution*).

**Test preparation**—To 250 mg of Bismuth Subcarbonate in a 125-mL conical flask add 20 mL of water, and swirl to suspend.

**Procedure**—To the *Standard solution* and the *Test preparation* add 0.05 mL of *Indigo carmine titrant*. Carefully add 30 mL of sulfuric acid, and immediately titrate with *Indigo carmine titrant* to a stable blue endpoint. The volume of *Indigo carmine titrant* consumed by the *Test preparation* does not exceed that consumed by the *Standard solution* (0.4%).

**Limit of silver**—To 2.0 g of Bismuth Subcarbonate add 1 mL of water and 4 mL of nitric acid. Heat gently to achieve dissolution, add water to obtain 11 mL of solution, and cool. Add 2 mL of 1 N hydrochloric acid, and allow to stand in a dark place for 5 minutes. No more turbidity is produced than corresponds to that produced with 10 mL of a solution containing 7.87 µg of silver nitrate per mL concomitantly treated with 1 mL of nitric acid and 2 mL of 1 N hydrochloric acid (0.0025%).

**Arsenic, Method I** (211)—Prepare the *Test Preparation* by dissolving 600 mg of it in 35 mL of 3 N hydrochloric acid. The limit is 5 µg per g.

#### Limit of copper—

**Standard solution**—To a 100-mL volumetric flask add 1.34 g of cupric chloride, 10 g of ammonium chloride, and 3 mL of sodium metabisulfite solution (275 mg per mL). Dilute with water to volume, and mix. This stock solution contains the equivalent of 5 mg of copper per mL. Dilute an accurately measured volume of this solution quantitatively and stepwise with 2 N nitric acid to obtain a solution containing the equivalent of 10 µg of copper per mL. Mix 0.25 mL of this solution and 9.75 mL of water (*Standard solution*).

**Test solution**—To 5 mL of the stock solution retained from the test for *Chloride* add 2 mL of 6 N ammonium hydroxide, dilute with water to 50 mL, mix, and filter. Use the filtrate as the *Test solution*.

**Procedure**—To 10 mL of the *Standard solution* and the *Test solution* add 1 mL of a solution of sodium diethyldithiocarbamate (1 in 1000): no more color is obtained from the *Test solution* than is obtained from the *Standard solution* (0.005%).

#### Limit of lead—

**Diluent**—Use 6 N nitric acid that is lead-free.

**Standard solutions**—Prepare a solution of lead nitrate in *Diluent* containing 0.1598 mg per mL. This solution contains 100 µg of lead per mL. Dilute an accurately measured volume of this solution, quantitatively and stepwise, with *Diluent* to obtain *Standard solutions* containing 1.0, 2.0, and 3.0 µg of lead per mL.

**Test solution**—Dissolve 12.5 g of Bismuth Subcarbonate in 75 mL of *Diluent*. Heat to boiling for 1 minute, cool, and dilute with water to 100 mL.

**Procedure**—Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at the lead emission line of 283.3 nm with an atomic absorption spectrophotometer (see *Spectrophotometry and Light-scattering* (851)) equipped with a lead hollow-cathode lamp and an air-acetylene flame, using a 1:5 dilution of the *Diluent* as the blank. Plot the absorbances of the *Standard solutions* versus concentration, in µg per mL, of lead, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C, in µg per mL, of lead in the *Test solution*. Calculate the percentage of lead

(Pb) in the portion of Bismuth Subcarbonate taken by the formula:

$$C / 1250.$$

The limit is 0.002%.

**Assay**—Dissolve about 500 mg of Bismuth Subcarbonate, accurately weighed, in 3 mL of nitric acid. Dilute with water to 250 mL, add 0.3 mL of xylenol orange TS, and titrate with 0.05 M edetate disodium VS to a yellow endpoint. Each mL of 0.05 M edetate disodium is equivalent to 12.75 mg of (BiO)<sub>2</sub>CO<sub>3</sub>.

## Bismuth Subgallate

C<sub>7</sub>H<sub>5</sub>BiO<sub>6</sub> 394.09

Gallic acid bismuth basic salt [99-26-3].

» Bismuth Subgallate is a basic salt which, when dried at 105° for 3 hours, contains the equivalent of not less than 52.0 percent and not more than 57.0 percent of Bi<sub>2</sub>O<sub>3</sub>.

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### Identification—

**A:** When heated to redness, it at first chars, leaving finally a yellow residue. This residue responds to the tests for *Bismuth* (191).

**B:** Agitate thoroughly about 100 mg with an excess of hydrogen sulfide TS, filter, and boil the filtrate to expel the dissolved gas. Cool, and add 1 drop of ferric chloride TS: a purplish blue mixture is produced.

**Loss on drying** (731)—Dry it at 105° for 3 hours. It loses not more than 7.0% of its weight.

**Limit of nitrate**—Mix about 100 mg with 5 mL of 2 N sulfuric acid and 5 mL of ferrous sulfate TS, filter the mixture, and carefully superimpose the filtrate, without mixing, on 5 mL of sulfuric acid, in a test tube: no reddish brown color appears at the zone of contact of the two liquids.

**Arsenic**—Triturate 400 mg with an equal weight of calcium hydroxide, and ignite. Dissolve the residue in 5 mL of 3 N hydrochloric acid: the solution without further treatment meets the requirements of the test for *Arsenic* (211) (7.5 ppm).

**Copper, Lead, and Silver**—Ignite 3 g in a porcelain crucible, cool, and cautiously add, dropwise, just sufficient nitric acid to dissolve the residue upon warming. Evaporate the solution to dryness, again ignite, and cool. Cautiously dissolve the residue in just sufficient nitric acid with the aid of gentle heat, concentrate the solution to about 4 mL, pour it into 100 mL of water, filter, evaporate the filtrate on a steam bath to 20 mL, again filter, and divide this filtrate into portions of 5 mL each. Using these several portions as the test liquid, proceed as directed for *Copper*, *Lead*, and *Silver* under *Bismuth Subnitrate*. The specified results are obtained.

**Limit of alkalies and alkaline earths**—Boil 1.0 g with 20 mL of a mixture of equal volumes of 6 N acetic acid and water, cool, and filter. Precipitate the bismuth from the filtrate by the addition of hydrogen sulfide, boil the mixture, and filter. Add 5 drops of sulfuric acid to the filtrate, evaporate to dryness, and ignite to constant weight: the weight of the residue does not exceed 5 mg (0.5%).

**Free gallic acid**—Shake 1.0 g with 20 mL of alcohol for 1 minute, filter and evaporate the filtrate to dryness on a steam bath, and dry the residue at 105° for 1 hour: the weight of the residue does not exceed 5 mg (0.5%).

**Assay**—Dry about 1 g of Bismuth Subgallate at 105° for 3 hours, then weigh accurately and ignite in a porcelain crucible. Allow it to cool and add nitric acid to the residue, dropwise, warming until complete solution has been effected. Evaporate the solution to dryness and carefully ignite the residue to constant weight. From the weight of the residue so obtained, determine the percentage of Bi<sub>2</sub>O<sub>3</sub> in the portion of Bismuth Subgallate taken.

## Bismuth Subnitrate

Bi<sub>5</sub>O(OH)<sub>9</sub>(NO<sub>3</sub>)<sub>4</sub> 1461.99  
Bismuth hydroxide nitrate oxide Bi<sub>5</sub>O(OH)<sub>9</sub>(NO<sub>3</sub>)<sub>4</sub>.  
Bismuth hydroxide nitrate oxide Bi<sub>5</sub>O(OH)<sub>9</sub>(NO<sub>3</sub>)<sub>4</sub>  
[1304-85-4].

» Bismuth Subnitrate is a basic salt that contains the equivalent of not less than 79.0 percent of bismuth trioxide (Bi<sub>2</sub>O<sub>3</sub>), calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**Identification**—It responds to the tests for *Bismuth* (191) and for *Nitrate* (191).

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 3.0% of its weight.

**Carbonate**—Add 3 g to 3 mL of warm nitric acid: no effervescence occurs. Pour the solution into 100 mL of water: a white precipitate forms. Filter, evaporate the filtrate on a steam bath to 30 mL, again filter the liquid, divide the latter filtrate into portions of 5 mL each, and use these several portions in the tests for *Chloride*, *Sulfate*, *Copper*, *Lead*, and *Silver*.

**Chloride** (221)—A 10-mL portion of the test liquid retained in the test for *Carbonate* shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.035%).

**Sulfate** (221)—To a 5-mL portion of the test liquid retained in the test for *Carbonate* add 5 drops of barium nitrate TS: no turbidity is produced immediately.

**Limit of ammonium salts**—Boil about 100 mg with 5 mL of 1 N sodium hydroxide: the vapor does not turn moistened red litmus paper blue.

**Arsenic, Method I** (211)—Mix 375 mg with 5 mL of water, cautiously add 2 mL of sulfuric acid, and heat the mixture until fumes of sulfur trioxide are copiously evolved. Cool, cautiously add 10 mL of water, and again evaporate to strong fuming, repeating, if necessary, to remove any trace of nitric acid. The limit is 8 ppm.

**Copper**—To a 5-mL portion of the test liquid retained in the test for *Carbonate* add a slight excess of 6 N ammonium hydroxide: the liquid does not exhibit a bluish color.

**Lead**—Mix a 5-mL portion of the test liquid retained in the test for *Carbonate* with an equal volume of 2 N sulfuric acid: the liquid does not become cloudy.

**Silver**—To a 5-mL portion of the test liquid retained in the test for *Carbonate* add hydrochloric acid, dropwise: no precipitate is formed that is insoluble in a slight excess of hydrochloric acid, but that is soluble in 6 N ammonium hydroxide.

**Limit of alkalis and alkaline earths**—Boil 1.0 g with 20 mL of a mixture of equal volumes of 6 N acetic acid and water, cool, and filter. Add 2 mL of 3 N hydrochloric acid, precipitate the bismuth by the addition of hydrogen sulfide,

boil the mixture, and filter it. Add 5 drops of sulfuric acid to the filtrate, evaporate to dryness, and ignite to constant weight: the weight of the residue does not exceed 5 mg (0.5%).

**Assay**—Transfer about 400 mg of Bismuth Subnitrate, accurately weighed, to a 250-mL beaker. Add 5 mL of water, then add 2 mL of nitric acid, and warm, if necessary, to effect solution. Dilute with water to 100 mL, add 0.3 mL of xylenol orange TS, and titrate with 0.05 M edetate disodium VS to a yellow endpoint. Each mL of 0.05 M edetate disodium is equivalent to 11.65 mg of Bi<sub>2</sub>O<sub>3</sub>.

## Bismuth Subsalcylate

C<sub>7</sub>H<sub>5</sub>BiO<sub>4</sub> 362.09  
(2-Hydroxybenzoato-O<sup>1</sup>)-oxobismuth;  
2-Hydroxybenzoic acid bismuth (3+) salt, basic  
[14882-18-9].

### DEFINITION

Bismuth Subsalcylate is a basic salt that contains NLT 56.0% and NMT 59.4% of bismuth (Bi) and NLT 36.5% and NMT 39.3% of total salicylates on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B. IDENTIFICATION TESTS—GENERAL**, *Bismuth* (191): Meets the requirements

### ASSAY

#### • BISMUTH

**Sample solution:** Transfer an equivalent to 300 mg of Bismuth Subsalcylate, previously dried at 105° for 3 h, to a porcelain crucible, and ignite. Allow it to cool, and add about 2 mL of nitric acid to the residue, dropwise, warming until dissolved. Add about 60 mL of water and 0.3 mL of xylenol orange TS.

#### Titrimetric system

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Endpoint detection:** Visual

**Analysis:** Titrate the *Sample solution* with *Titrant* to a yellow endpoint. Each mL of *Titrant* is equivalent to 10.45 mg of bismuth (Bi).

**Acceptance criteria:** 56.0%–59.4% of bismuth (Bi) on the dried basis

#### • TOTAL SALICYLATES

**Solution A:** Ferric ammonium sulfate TS, 1 N hydrochloric acid, and water (4:1:15)

**Standard stock solution:** 0.2 mg/mL of USP Salicylic Acid RS in water

**Standard solution:** 0.05 mg/mL of USP Salicylic Acid RS in water, prepared by adding 25.0 mL of *Standard stock solution* and 70 mL of water to a 100-mL volumetric flask. Adjust with 0.5 N sodium hydroxide or 1 N hydrochloric acid to a pH of 4.5, before dilution with water to volume.

**Reacted standard solution:** To 25.0 mL of *Standard solution* add 1.0 mL of *Solution A*.

**Unreacted standard solution:** To 25.0 mL of the *Standard solution* add 1.0 mL of 0.05 N hydrochloric acid.

**Sample solution:** Transfer 52 mg of Bismuth Subsalcylate, previously dried at 105° for 3 h, into a 200-mL volumetric flask. Add 10 mL of 0.5 N sodium hydroxide, heat on a steam bath for 15 min, allow to cool, and dilute with water to volume. Centrifuge 70 mL, and then transfer 50.0 mL of the clear supernatant to a beaker. Add about 40 mL of water, and adjust with 0.5 N sodium hydroxide or 1 N hydrochloric acid to a pH of 4.5. Transfer this solution to a 100-mL volumetric flask with the aid of water, and dilute with water to volume.

**Reacted sample solution:** To 25.0 mL of *Sample solution* add 1.0 mL of *Solution A*.

**Unreacted sample solution:** To 25.0 mL of the *Sample solution* add 1.0 mL of 0.05 N hydrochloric acid.

**Blank:** Water, adjusted with 0.5 N sodium hydroxide or 1 N hydrochloric acid to a pH of 4.5

**Reacted blank solution:** To 25.0 mL of *Blank* add 1.0 mL of *Solution A*.

**Unreacted blank:** To 25.0 mL of *Blank* add 1.0 mL of 0.05 N hydrochloric acid.

#### Instrumental conditions

**Mode:** UV

**Analytical wavelength:** 525 nm

#### Analysis

**Samples:** *Reacted standard solution*, *Unreacted standard solution*, *Reacted sample solution*, *Unreacted sample solution*, *Reacted blank solution*, and *Unreacted blank solution*. Concomitantly determine the absorbances of the *Samples*.

Calculate the percentage of total salicylates in the portion of dried Bismuth Subsalicylate taken:

$$\text{Result} = [(A_{UR} - A_{UU} - B)/(A_{SR} - A_{SU} - B)] \times (C_S/C_U) \times 100$$

$A_{UR}$  = absorbance of the *Reacted sample solution*

$A_{UU}$  = absorbance of the *Unreacted sample solution*

$B$  = difference in the absorption of the *Reacted blank solution* and the absorption of the *Unreacted blank*

$A_{SR}$  = absorbance of the *Reacted standard solution*

$A_{SU}$  = absorbance of the *Unreacted standard solution*

$C_S$  = concentration of USP Salicylic Acid RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Bismuth Subsalicylate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 36.5%–39.3% of total salicylates on the dried basis

#### IMPURITIES

##### • ARSENIC, Method I (211)

**Sample:** 300 mg of Bismuth Subsalicylate with 300 mg of calcium hydroxide

**Analysis:** Triturate the *Sample*, and ignite. Dissolve the residue in 5 mL of 3 N hydrochloric acid.

**Acceptance criteria:** 10 ppm

##### • LIMIT OF COPPER, LEAD, AND SILVER

**Standard stock solution:** Add 3.0 mL each of 1000-µg/mL solutions of copper, lead, and silver, respectively, to a 2000-mL flask, and dilute with 1 M nitric acid to volume.

**Standard solution:** 1.5 µg/mL of copper, 1.5 µg/mL of lead, and 1.5 µg/mL of silver, in 1 M nitric acid from the *Standard stock solution*. The concentrations of copper, lead, and silver may be modified by using different volumes or concentrations to bring the absorption response within the working range of the atomic absorption spectrophotometer.

**Sample solution:** Ignite 3 g of sample in a porcelain crucible, cool, and cautiously add 6 M nitric acid to dissolve the residue, and evaporate on a steam bath. Ignite the residue, cool, transfer the residue to a tared conical flask, and wash the flask with about 5 mL of 6 M nitric acid, adding the wash to the conical flask. Dissolve the residue with the aid of heat, and add water to obtain a solution weighing 20.0 g. The concentrate of Bismuth Subsalicylate may be modified by using the same proportions used for modifying the *Standard solution*, by using a different quantity, or by further dilution.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 324.7 nm for copper; 217 nm for lead; 328.1 nm for silver

**Lamps:** Copper, lead, and silver hollow-cathode, and oxidizing flames

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

**Acceptance criteria:** 10 ppm; the absorbances of the *Sample solutions* do not exceed those of the *Standard solutions* for each element.

##### • LIMIT OF SOLUBLE BISMUTH

**Standard solution:** 2 µg/mL of bismuth (Bi), prepared as follows. Add 242.0 mg of bismuth nitrate pentahydrate to a 100-mL volumetric flask, add 3 mL of 1.5 M nitric acid, swirl to dissolve, and dilute with water to volume. Add 1.0 mL of this solution to a 500-mL volumetric flask, add 250 mL of 1.5 M nitric acid, and dilute with water to volume. The concentration of bismuth in this solution may be modified by using a lesser dilution or by further dilution to bring the absorption response within the working range of the atomic absorption spectrophotometer.

**Sample solution:** 5.0 g of Bismuth Subsalicylate in 100 mL of water, and stir the suspension thus obtained for 2 h at 20°–23°. Pass through filter paper. Pass the filtrate thus obtained through a filter of 0.1-µm or less pore size. Add 0.1 mL of nitric acid to 10.0 mL of the filtrate. The concentrate of Bismuth Subsalicylate may be modified by using the same proportions used for modifying the *Standard solution*, by using a different quantity, or by further dilution.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 223.06 nm for bismuth

**Lamp:** Bismuth hollow-cathode and an oxidizing flame

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Concomitantly determine the absorbances of the *Standard solution* and the *Sample solution*.

**Acceptance criteria:** 40 ppm; the absorbances of the *Sample solution* do not exceed those of the *Standard solution*.

##### • LIMIT OF NITRATE

**Standard solution:** To 0.1 g of salicylic acid add 6 mL of water, 4.0 mL of a solution containing 100 µg of nitrate per mL, and 20 mL of sulfuric acid. Prepare concomitantly with the *Sample solution*.

**Sample solution:** Add 10 mL of water to 0.1 g of Bismuth Subsalicylate. Carefully add 20 mL of sulfuric acid.

**Acceptance criteria:** 0.4%; the *Sample solution* should not be more yellow than the *Standard solution*.

##### • LIMIT OF FREE SALICYLIC ACID

**Mobile phase:** Methanol and 0.06 M acetic acid (55:45)

**Diluent:** Acetonitrile and water (1:1)

**Standard solution:** 0.02 mg/mL of USP Salicylic Acid RS in *Diluent*

**Sample solution:** Add 260 mg of Bismuth Subsalicylate to a glass centrifuge tube, add about 12 mL of acetonitrile, shake by mechanical means for 20 min, and centrifuge. Decant the supernatant into a suitable container. Repeat the acetonitrile addition, shaking, centrifuging, and decanting. Combine the decanted liquid with the first decantate. Pass the combined liquid through a filter of 0.5-µm or finer pore size, and collect the filtrate in a 50-mL volumetric flask. Wash the container with 5 mL of acetonitrile, and filter the wash, collecting the filtrate in the volumetric flask. Dilute with water to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 300 nm

**Columns**

**Guard:** 3.2-mm × 1.5-cm; 5-μm packing L1  
**Analytical:** 4.6-mm × 30-cm; 5-μm packing L1  
**Flow rate:** 1 mL/min  
**Injection volume:** 20 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of free salicylic acid in the portion of Bismuth Subsalicylate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of salicylic acid from the *Sample solution*

$r_S$  = peak area of salicylic acid from the *Standard solution*

$C_S$  = concentration of USP Salicylic Acid RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the Bismuth Subsalicylate in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 0.2%

**SPECIFIC TESTS**• **PH** (791)

**Sample solution:** 10 g of Bismuth Subsalicylate in 90 mL of water

**Analysis:** Shake by mechanical means for 10 min, and filter.

**Acceptance criteria:** 2.7–5.0

• **LOSS ON DRYING** (731)

**Analysis:** Dry at 105° for 3 h.

**Acceptance criteria:** NMT 1.0%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS** (11)

USP Bismuth Subsalicylate RS

USP Salicylic Acid RS

**Bismuth Subsalicylate Magma****DEFINITION**

Bismuth Subsalicylate Magma is a suspension of Bismuth Subsalicylate in water that contains NLT 90.0% and NMT 110.0% of the labeled amount of bismuth subsalicylate ( $C_7H_5BiO_4$ ). Bismuth subsalicylate is a basic salt that when dried at 105° for 3 h contains NLT 56.0% and NMT 59.4% bismuth (Bi) and NLT 36.5% and NMT 39.3% of total salicylates.

Dry at 105° for 3 h to determine the solids content and, after determining the solids content, perform all tests on a portion of the dried Magma.

**IDENTIFICATION**• **A. INFRARED ABSORPTION** (197M)

• **B. IDENTIFICATION TESTS—GENERAL,** *Bismuth* (191): Meets the requirements

**ASSAY**• **BISMUTH**

**Sample solution:** Transfer an equivalent to 300 mg of bismuth subsalicylate, previously dried at 105° for 3 h, to a porcelain crucible, and ignite. Allow it to cool, and add about 2 mL of nitric acid to the residue, dropwise, warming until dissolved. Add about 60 mL of water and 0.3 mL of xylene orange TS.

**Titrimetric system**

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Endpoint detection:** Visual

**Analysis:** Titrate the *Sample solution* with *Titrant* to a yellow endpoint. Each mL of *Titrant* is equivalent to 10.45 mg of bismuth (Bi).

**Acceptance criteria:** 56.0%–59.4% of bismuth on the previously dried basis

• **TOTAL SALICYLATES**

**Solution A:** Ferric ammonium sulfate TS, 1 N hydrochloric acid, and water (4:1:15)

**Standard stock solution:** 0.2 mg/mL of USP Salicylic Acid RS in water

**Standard solution:** 0.05 mg/mL of USP Salicylic Acid RS in water, prepared by adding 25.0 mL of *Standard stock solution* and 70 mL of water to a 100-mL volumetric flask. Adjust with 0.5 N sodium hydroxide or 1 N hydrochloric acid to a pH of 4.5, before dilution with water to volume.

**Reacted standard solution:** To 25.0 mL of *Standard solution* add 1.0 mL of *Solution A*.

**Unreacted standard solution:** To 25.0 mL of the *Standard solution* add 1.0 mL of 0.05 N hydrochloric acid.

**Sample solution:** Transfer an equivalent to 52 mg of bismuth subsalicylate from previously dried Magma at 105° for 3 h to a 200-mL volumetric flask. Add 10 mL of 0.5 N sodium hydroxide, heat on a steam bath for 15 min, allow to cool, and dilute with water to volume. Centrifuge 70 mL, and then transfer 50.0 mL of the clear supernatant to a beaker. Add about 40 mL of water, and adjust with 0.5 N sodium hydroxide or 1 N hydrochloric acid to a pH of 4.5. Transfer this solution to a 100-mL volumetric flask with the aid of water, and dilute with water to volume.

**Reacted sample solution:** To 25.0 mL of *Sample solution* add 1.0 mL of *Solution A*.

**Unreacted sample solution:** To 25.0 mL of the *Sample solution* add 1.0 mL of 0.05 N hydrochloric acid.

**Blank:** Water, adjusted with 0.5 N sodium hydroxide or 1 N hydrochloric acid to a pH of 4.5

**Reacted blank solution:** To 25.0 mL of *Blank* add 1.0 mL of *Solution A*.

**Unreacted blank:** To 25.0 mL of *Blank* add 1.0 mL of 0.05 N hydrochloric acid.

**Instrumental conditions**

**Mode:** UV

**Analytical wavelength:** 525 nm

**Analysis**

**Samples:** *Reacted standard solution*, *Unreacted standard solution*, *Reacted sample solution*, *Unreacted sample solution*, *Reacted blank solution*, and *Unreacted blank solution*. Concomitantly determine the absorbances of the *Samples*.

Calculate the percentage of total salicylates in the portion of dried Magma taken:

$$\text{Result} = [(A_{UR} - A_{UU} - B)/(A_{SR} - A_{SU} - B)] \times (C_S/C_U) \times 100$$

$A_{UR}$  = absorbance of the *Reacted sample solution*

$A_{UU}$  = absorbance of the *Unreacted sample solution*

$B$  = difference in the absorption of the *Reacted blank solution* and the absorption of the *Unreacted blank*

$A_{SR}$  = absorbance of the *Reacted standard solution*

$A_{SU}$  = absorbance of the *Unreacted standard solution*

$C_S$  = concentration of USP Salicylic Acid RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of bismuth subsalicylate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 36.5%–39.3% of total salicylates on the previously dried basis

**IMPURITIES****• LIMIT OF COPPER, LEAD, AND SILVER**

**Standard stock solution:** Add 3.0 mL each of 1000- $\mu$ g/mL solutions of copper, lead, and silver, respectively, to a 2000-mL flask, and dilute with 1 M nitric acid to volume.

**Standard solution:** 1.5  $\mu$ g/mL of copper, 1.5  $\mu$ g/mL of lead, and 1.5  $\mu$ g/mL of silver, in 1 M nitric acid from the *Standard stock solution*. The concentrations of copper, lead, and silver may be modified by using different volumes or concentrations to bring the absorption response within the working range of the atomic absorption spectrophotometer.

**Sample solution:** Ignite 3 g of sample in a porcelain crucible, cool, cautiously add 6 M nitric acid to dissolve the residue, and evaporate on a steam bath. Ignite the residue, cool, transfer the residue to a tared conical flask, and wash the flask with about 5 mL of 6 M nitric acid, adding the wash to the conical flask. Dissolve the residue with the aid of heat, and add water to obtain a solution weighing 20.0 g. The concentrate of bismuth subsalicylate may be modified by using the same proportions used for modifying the *Standard solution*, by using a different quantity, or by further dilution.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 324.7 nm for copper; 217 nm for lead; 328.1 nm for silver

**Lamps:** Copper, lead and silver hollow-cathode, and oxidizing flames

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Concomitantly determine the absorbances of the *Standard solution* and the *Sample solution*

**Acceptance criteria:** 10 ppm; the absorbances of the *Sample solutions* do not exceed those of the *Standard solutions* for each element.

**• LIMIT OF SOLUBLE BISMUTH**

**Standard solution:** 2  $\mu$ g/mL of bismuth (Bi), prepared as follows. Add 242.0 mg of bismuth nitrate pentahydrate to a 100-mL volumetric flask, add 3 mL of 1.5 M nitric acid, swirl to dissolve, and dilute with water to volume. Add 1.0 mL of this solution to a 500-mL volumetric flask, add 250 mL of 1.5 M nitric acid, and dilute with water to volume. The concentration of bismuth in this solution may be modified by using a lesser dilution or by further dilution to bring the absorption response within the working range of the atomic absorption spectrophotometer.

**Sample solution:** 5.0 g of bismuth subsalicylate from dried Magma in 100 mL of water, and stir the suspension thus obtained for 2 h at 20°–23°. Pass through filter paper. Pass the filtrate thus obtained through a filter of 0.1- $\mu$ m or less pore size. Add 0.1 mL of nitric acid to 10.0 mL of the filtrate. The concentrate of bismuth subsalicylate may be modified by using the same proportions used for modifying the *Standard solution*, by using a different quantity, or by further dilution.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 223.06 nm for bismuth

**Lamp:** Bismuth hollow-cathode and an oxidizing flame

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Concomitantly determine the absorbances of the *Standard solution* and the *Sample solution*.

**Acceptance criteria:** 40 ppm; the absorbances of the *Sample solution* do not exceed those of the *Standard solution*.

**• LIMIT OF NITRATE**

**Standard solution:** To 0.1 g of salicylic acid add 6 mL of water, 4.0 mL of a solution containing 100  $\mu$ g of nitrate per mL, and 20 mL of sulfuric acid. Prepare concomitantly with the *Sample solution*.

**Sample solution:** Add 10 mL of water to 0.1 g of Magma. Carefully add 20 mL of sulfuric acid, and mix.

**Acceptance criteria:** 0.4%; the *Sample solution* should not be more yellow than the *Standard solution*.

**• LIMIT OF FREE SALICYLIC ACID**

**Mobile phase:** Methanol and 0.06 M acetic acid (550:450)

**Diluent:** Acetonitrile and water (1:1)

**Standard solution:** 0.02 mg/mL of USP Salicylic Acid RS in *Diluent*

**Sample solution:** Add 260 mg of bismuth subsalicylate from dried Magma to a glass centrifuge tube, add about 12 mL of acetonitrile, shake by mechanical means for 20 min, and centrifuge. Decant the supernatant into a suitable container. Repeat the acetonitrile addition, shaking, centrifuging, and decanting, combining the decanted liquid with the first decantate. Pass the combined liquid through a filter of 0.5- $\mu$ m pore size, collecting the filtrate in a 50-mL volumetric flask. Wash the container with 5 mL of acetonitrile, and filter the wash, collecting the filtrate in the volumetric flask. Dilute with water to volume.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 300 nm

**Columns**

**Guard:** 3.2-mm  $\times$  1.5-cm; 5- $\mu$ m packing L1

**Analytical:** 4.6-mm  $\times$  30-cm; 5- $\mu$ m packing L1

## Bismuth Subsalicylate Oral Suspension

### DEFINITION

Bismuth Subsalicylate Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of bismuth subsalicylate ( $C_7H_5BiO_4$ ). It may contain one or more suitable buffers, coloring agents, flavors, preservatives, stabilizers, sweeteners, and suspending agents.

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Bismuth (191):** Meets the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Salicylate (191):** Meets the requirements after acidifying with nitric acid

### ASSAY

#### • PROCEDURE

**Standard stock solution:** 2.5 mg/mL of bismuth metal in nitric acid. Prepare by dissolving in 6% of the flask volume of nitric acid and diluting with 0.01 N nitric acid to volume.

**Standard solution:** 0.05 mg/mL of bismuth in 1 N nitric acid from the *Standard stock solution*

**Sample solution:** Transfer 10 g of Oral Suspension, previously well shaken in its original container to ensure homogeneity, in a 200-mL volumetric flask. Add about 100 mL of 1 N nitric acid, and dilute with 1 N nitric acid to volume. Mix well without shaking, transfer 10.0 mL of this mixture to a 100-mL volumetric flask, and dilute with 1 N nitric acid to volume. Centrifuge about 20 mL at 4500 rpm for at least 10 min.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV-Vis

**Analytical wavelength:** 463 nm

**Cell:** 1 cm

**Blank:** 1 N nitric acid

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*  
Transfer a measured volume of the *Sample solution* that contains 0.9 mg of bismuth subsalicylate and 10 mL of the *Standard solution* to separate 50-mL volumetric flasks. Add 10.0 mL of 10% ascorbic acid solution and 25.0 mL of 20% potassium iodide solution to each volumetric flask, and dilute with water to volume. Concomitantly determine the absorbances of both solutions, using the *Blank* to set the spectrophotometer. Calculate the percentage of the labeled amount of bismuth subsalicylate ( $C_7H_5BiO_4$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of bismuth in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of bismuth subsalicylate, 362.09

$M_{r2}$  = molecular weight of bismuth, 208.98

**Acceptance criteria:** 90.0%–110.0%

### SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count is NMT  $10^2$  cfu/g, and the total combined molds and yeasts count is NMT  $5 \times 10^1$  cfu/g. It meets the requirements of the tests for the absence of *Escherichia coli*.
- **pH (791):** 3.0–5.0

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Protect from freezing. Avoid excessive heat (over 40°).

## Bismuth Subsalicylate Tablets

### DEFINITION

Bismuth Subsalicylate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bismuth subsalicylate ( $C_7H_5BiO_4$ ).

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Bismuth (191):** Meet the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Salicylate (191):** After acidifying with nitric acid, it meets the requirements of the test with ferric chloride TS.

### ASSAY

#### • PROCEDURE

**Standard stock solution:** 2.5 mg/mL of bismuth in nitric acid. Prepare by dissolving in 6% of the flask volume of nitric acid, and diluting with 0.01 N nitric acid to volume.

**Standard solution:** 0.05 mg/mL of bismuth in 1 N nitric acid from the *Standard stock solution*

**Sample stock solution:** Equivalent to 90 mg of bismuth subsalicylate from finely powdered Tablets in a 200-mL volumetric flask. Add 150 mL of 1 N nitric acid, and sonicate for 2 min. Dilute with 1 N nitric acid to volume.

**Sample solution:** Transfer 20.0 mL of the *Sample stock solution* to a 100-mL volumetric flask, and dilute with 1 N nitric acid to volume. Centrifuge a portion at 4500 rpm for at least 10 min.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV-Vis

**Analytical wavelength:** 463 nm

**Cell:** 1 cm

**Blank:** 10% ascorbic acid solution, 20% potassium iodide solution, and 1 N nitric acid (2:5:1)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Transfer 10.0 mL of the *Standard solution* and the *Sample solution* to separate 50.0-mL volumetric flasks, and dilute with the *Blank* to volume. Concomitantly determine the absorbance of the solutions at the wavelength of maximum absorbance at 463 nm with a suitable spectrophotometer, using the combined reagent solutions as the blank.

Calculate the percentage of the labeled amount of bismuth subsalicylate ( $C_7H_5BiO_4$ ) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of bismuth in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of bismuth subsalicylate, 362.09

$M_{r2}$  = molecular weight of bismuth, 208.98

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISINTEGRATION <701>

This test does not apply to Tablets labeled as chewable.

Time: 10 min

Acceptance criteria: Meet the requirements

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Avoid excessive heat (over 40°).
- **LABELING:** Label chewable Tablets to indicate that they are to be chewed before swallowing.

## Bisotrizole

$C_{41}H_{50}N_6O_2$  658.87

Phenol, 2,2'-methylenebis[6-(2*H*-benzotriazol-2-yl)-4-(1,1,3,3-tetramethylbutyl)]-

2,2'-Methylenebis[6-(2*H*-benzotriazol-2-yl)-4-(1,1,3,3-tetramethylbutyl)phenol] [103597-45-1].

» Bisotrizole contains not less than 96.0 percent and not more than 102.0 percent of  $C_{41}H_{50}N_6O_2$ , calculated on the as-is basis.

**Packaging and storage**—Preserve in well-closed containers, and store at controlled room temperature.

### USP Reference standards <11>—

USP Bisotrizole RS

USP Bisotrizole Related Compound A RS

2-(2*H*-Benzotriazol-2-yl)-4-(1,1,3,3-tetramethylbutyl)phenol.

$C_{20}H_{25}N_3$  323.43

USP Bisotrizole Resolution Mixture RS

A mixture of approximately 1.5% of bisotrizole isomer [phenol, 2,2'-methylenebis[6-(2*H*-benzotriazol-2-yl)-4-(1,1,3,3-tetramethylbutyl)]] in a matrix of bisotrizole.

### Identification—

**A:** Infrared Absorption <197K>.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Heavy metals, Method II <231>:** 0.002%.

### Limit of bisotrizole related compound A and the bisotrizole isomer—

*Diluent, Solution A, Solution B, and Mobile phase*—Proceed as directed in the *Assay*.

*Standard stock solution A*—Dissolve an accurately weighed quantity of USP Bisotrizole RS in tetrahydrofuran to obtain a solution having a known concentration of about 0.65 mg per mL.

*Standard stock solution B*—Dissolve an accurately weighed quantity of USP Bisotrizole Related Compound A RS in tetrahydrofuran to obtain a solution having a known concentration of about 0.40 mg per mL.

*Standard solution*—Quantitatively transfer 5 mL of *Standard stock solution A* and 1.0 mL of *Standard stock solution B* to a 100-mL volumetric flask. Add 60 mL of tetrahydrofuran, and dilute with *Diluent* to volume.

*Test solution*—Proceed as directed for the *Assay preparation*.

*Chromatographic system*—Proceed as directed in the *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between bisotrizole and the bisotrizole isomer is not less than 1.5. [NOTE—For identification purposes, the relative retention times are about 0.42 for bisotrizole related compound A and about 1.1 for the bisotrizole isomer.]

*Procedure*—Inject a volume (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of bisotrizole related compound A taken by the formula:

$$10,000(C/W)(r_U/r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Bisotrizole Related Compound A RS;  $W$  is the weight, in mg, of Bisotrizole taken;  $r_U$  is the peak response for bisotrizole related compound A in the *Test solution*; and  $r_S$  is the peak response for bisotrizole related compound A in the *Standard solution*: not more than 0.5% of bisotrizole related compound A is found. Calculate the percentage of the bisotrizole isomer taken by the formula:

$$10,000(C/W)(r_U/r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Bisotrizole RS;  $W$  is the weight, in mg, of Bisotrizole taken;  $r_U$  is the peak response for the bisotrizole isomer in the *Test solution*; and  $r_S$  is the peak response for bisotrizole in the *Standard solution*: not more than 4.0% of the bisotrizole isomer is found.

### Related compounds—

*Diluent, Solution A, Solution B, Mobile phase, and Chromatographic system*—Proceed as directed in the *Assay*.

*Test solution*—Proceed as directed for the *Assay preparation*.

*Procedure*—Inject a volume (about 10  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Bisotrizole taken by the formula:

$$100(r_i/r_S)$$

in which  $r_i$  is the peak response for each individual impurity, and  $r_S$  is the sum of the responses of all the peaks: not more than 0.1% of any individual impurity, excluding bisotrizole related compound A and the bisotrizole isomer, is found. Not more than 4.0% of total impurities, including bisotrizole related compound A, and the bisotrizole isomer, determined in the test for *Limit of bisotrizole related compound A and the bisotrizole isomer*, is found.

### Assay—

*Diluent*—Prepare a mixture containing tetrahydrofuran and a 0.2% (w/v) aqueous solution of 1-pentane sulfonic acid sodium salt (60:40).

*Solution A*—Prepare a filtered and degassed solution containing 0.4 g of 1-pentane sulfonic acid sodium salt, 800 mL of methanol, 200 mL of water, and 0.5 mL of phosphoric acid.

*Solution B*—Prepare a filtered and degassed solution containing 0.4 g of 1-pentane sulfonic acid sodium salt, 1000 mL of methanol, and 0.5 mL of phosphoric acid.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Dissolve an accurately weighed quantity of USP Bisoprolol Resolution Mixture RS in tetrahydrofuran, and dilute quantitatively with *Diluent* to obtain a solution having a known concentration of about 0.8 mg per mL of bisoprolol.

**Standard preparation**—Transfer about 80 mg of USP Bisoprolol RS, accurately weighed, to a 100-mL volumetric flask. Dissolve in 60 mL of tetrahydrofuran, dilute with *Diluent* to volume, and mix.

**Assay preparation**—Transfer about 80 mg of Bisoprolol, accurately weighed, to a 100-mL volumetric flask. Dissolve in 60 mL of tetrahydrofuran, dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 346-nm detector and a 3.0-mm × 25-cm column that contains packing L1. The flow rate is about 0.8 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–1	70	30	isocratic
1–11	70→3	30→97	linear gradient
11–27	3	97	isocratic
27–28	3→70	97→30	linear gradient

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for bisoprolol and 1.1 for the bisoprolol isomer; the resolution, *R*, between bisoprolol and the bisoprolol isomer is not less than 1.5; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{41}H_{50}N_6O_2$  in the portion of Bisoprolol taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Bisoprolol RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bisoprolol Fumarate

$(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$  766.96

2-Propanol, 1-[4-[[2-(1-methylethoxy)ethoxy]methyl]phenoxy]-3-[(1-methylethyl)amino]-, (±)-, (E)-2-butenedioate (2:1) (salt).

(±)-1-[[α-(2-isopropoxyethoxy)-p-tolyl]oxy]-3-(isopropylamino)-2-propanol fumarate (2:1) (salt) [104344-23-2].

» Bisoprolol Fumarate contains not less than 97.5 percent and not more than 102.0 percent of

$(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at controlled room temperature.

**USP Reference standards** <11>—  
USP Bisoprolol Fumarate RS

**Identification**—

**A:** *Infrared Absorption* <197K>.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** <781>: between −2° and +2°.

*Test solution*: 10 mg per mL, in methanol.

**Water**, *Method I* <921>: not more than 0.5%.

**Residue on ignition** <281>: not more than 0.1%.

**Heavy metals**, *Method I* <231>: 0.002%.

**Chromatographic purity**—

*Diluent*, *Mobile phase*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Standard solution*—Prepare as directed for *Standard preparation* in the *Assay*.

*Test solution*—Prepare as directed for *Assay preparation* in the *Assay*.

**Procedure**—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas. Calculate the percentage of total impurities in the portion of Bisoprolol Fumarate taken by the formula:

$$100(r_i / r_s)$$

in which *r<sub>i</sub>* is the sum of areas for all the peaks, excluding the fumaric acid and bisoprolol peaks; and *r<sub>s</sub>* is the sum of the areas of all the peaks in the chromatogram: not more than 0.5% of total impurities is found.

**Content of fumaric acid**—Transfer about 500 mg of Bisoprolol Fumarate, accurately weighed, to a beaker, and dissolve in 70 mL of dehydrated alcohol. Add 8.0 mL of 0.1 N tetrabutylammonium hydroxide VS, and stir for 2 minutes. Titrate with 0.1 N tetrabutylammonium hydroxide VS, determining the endpoint potentiometrically, using a glass-calomel electrode system. Perform a blank determination, and make any necessary correction (see *Titrimetry* <541>). Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 5.804 mg of fumaric acid: not less than 14.8% and not more than 15.4% of fumaric acid is found, calculated on the anhydrous basis.

**Assay**—

*Diluent*—Prepare a mixture of water and acetonitrile (65:35).

**Mobile phase**—To a 1-L portion of *Diluent* add 5 mL of heptafluorobutyric acid, 5 mL of diethylamine, and 2.5 mL of formic acid. Mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Prepare a solution in *Diluent* containing about 0.5 mg of propranolol hydrochloride and 1 mg of Bisoprolol Fumarate per mL.

**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Bisoprolol Fumarate RS in *Diluent* to obtain a solution having a known concentration of about 1 mg per mL.

**Assay preparation**—Transfer about 50 mg of Bisoprolol Fumarate, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 273-nm detector and a 4.6-mm × 12.5-cm column that contains packing L7.

The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak areas as directed for *Procedure*: the resolution,  $R$ , between bisoprolol and propranolol is not less than 7.0. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of  $(\text{C}_{18}\text{H}_{31}\text{NO}_4)_2 \cdot \text{C}_4\text{H}_4\text{O}_4$  in the portion of Bisoprolol Fumarate taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Bisoprolol Fumarate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bisoprolol Fumarate Tablets

### DEFINITION

Bisoprolol Fumarate Tablets contain NLT 90.0% and NMT 105.0% of the labeled amount of bisoprolol fumarate  $[(\text{C}_{18}\text{H}_{31}\text{NO}_4)_2 \cdot \text{C}_4\text{H}_4\text{O}_4]$ .

### IDENTIFICATION

#### • THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST <201>

**Sample solution:** Equivalent to 40 mg of bisoprolol fumarate, from powdered Tablets (NLT 5), in a 50-mL flask. Add about 20 mL of a mixture of dichloromethane and methanol (7:3), shake for 30 min, centrifuge, and use the clear solution.

**Application volume:** 20  $\mu$ L

**Developing solvent system:** Dichloromethane, methanol, and ammonia TS, stronger (70: 10: 0.8)

#### Analysis

**Sample:** *Sample solution*

Proceed as directed in the chapter, except to develop the chromatogram until the solvent front has moved about two-thirds of the length of the plate and to dry the plate in a current of cold air.

### ASSAY

#### • PROCEDURE

**Diluent:** Acetonitrile and water (7:13)

**Mobile phase:** A 1-L portion of *Diluent*. Add 5 mL of heptafluorobutyric acid, 5 mL of diethylamine, and 2.5 mL of formic acid.

**System suitability solution:** 0.5 mg/mL of propranolol hydrochloride and 1 mg/mL of bisoprolol fumarate in *Diluent*

**Standard solution:** 1 mg/mL of USP Bisoprolol Fumarate RS in *Diluent*

**Sample solution:** Transfer an equivalent of 25 mg of bisoprolol fumarate, from powdered Tablets (NLT 20), to a 25-mL volumetric flask. Add 10 mL of *Diluent*, and sonicate for 10 min. Cool, dilute with *Diluent* to volume, and mix. Centrifuge for 20 min, and use the clear supernatant.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 273 nm

**Column:** 4.6-mm  $\times$  12.5-cm; packing L7

**Flow rate:** 1 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 7.0 between bisoprolol and propranolol, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $(\text{C}_{18}\text{H}_{31}\text{NO}_4)_2 \cdot \text{C}_4\text{H}_4\text{O}_4$  in the portion of Tablets taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Bisoprolol Fumarate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of bisoprolol fumarate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–105.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

##### Test 1

**Medium:** Water; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 20 min

Determine the amount of  $(\text{C}_{18}\text{H}_{31}\text{NO}_4)_2 \cdot \text{C}_4\text{H}_4\text{O}_4$  dissolved by using the following method.

**Diluent:** Methanol, triethylamine, phosphoric acid, and water (160: 5: 2.5: 35)

**Mobile phase:** Methanol, triethylamine, and water (34:1:50). Adjust with phosphoric acid to a pH of 4.0  $\pm$  0.1.

**Standard stock solution:** USP Bisoprolol Fumarate RS in water to obtain a solution having a known concentration of about twice the concentration of bisoprolol fumarate in the *Sample solution*

**Standard solution:** *Standard stock solution* and *Diluent* (1:1)

**Sample solution:** Sample per *Dissolution* <711>. Withdraw a portion of the solution under test, filter, and dilute with an equal volume of *Diluent*.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 227 nm

**Column:** 4.6-mm  $\times$  33-mm; packing L7

**Flow rate:** 1 mL/min

**Injection size:** 50  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

**Tolerances:** NLT 80% (Q) of the labeled amount of  $(\text{C}_{18}\text{H}_{31}\text{NO}_4)_2 \cdot \text{C}_4\text{H}_4\text{O}_4$  is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 0.5 M sodium chloride; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 20 min

**Analysis:** Proceed as directed for *Test 1* with the following modifications.

**Diluent:** Prepare a mixture of methanol, 0.1 N hydrochloric acid, triethylamine, and phosphoric acid (160: 35: 5: 2.5). The dimensions of the column are 4.6 mm  $\times$  25 cm.

**Tolerances:** NLT 80% (Q) of the labeled amount of  $(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$  is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**  
USP Bisoprolol Fumarate RS  
2-Propanol, 1-[4-[[2-(1-methylethoxy)ethoxy-  
y]methyl]phenoxy]-3-[(1-methylethyl)amino]-, (±)-, (E)-  
2-butenedioate (2:1) (salt).  
 $(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$  766.96

### Bisoprolol Fumarate and Hydrochlorothiazide Tablets

» Bisoprolol Fumarate and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of bisoprolol fumarate  $(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$  and hydrochlorothiazide  $(C_7H_8ClN_3O_4S_2)$ .

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at controlled room temperature.

#### USP Reference standards (11)—

USP Bisoprolol Fumarate RS  
USP Chlorothiazide RS  
USP Hydrochlorothiazide RS

#### Identification—

**A:** *Thin-Layer Chromatographic Identification Test (201)*—

**Test solution**—Finely powder 1 Tablet, and transfer the powder to a 5-mL volumetric flask. Dilute with methanol to volume, sonicate for 5 minutes, centrifuge, and use the supernatant.

**Standard solution 1**—Dissolve a suitable quantity of USP Bisoprolol Fumarate RS in methanol to obtain a solution containing 1 mg per mL.

**Standard solution 2**—Dissolve a suitable quantity of USP Hydrochlorothiazide RS in methanol to obtain a solution containing 1 mg per mL.

**Application volume:** 25  $\mu$ L.

**Developing solvent system:** a mixture of methylene chloride, methanol, and 14.5 M ammonium hydroxide solution (43:20:8).

**Procedure**—Locate the spots on the plate under short-wavelength UV light and by exposure to iodine vapors: the  $R_f$  values of the principal spots in the chromatogram obtained from the *Test solution* correspond to those of the principal spots in the chromatograms obtained from *Standard solution 1* and *Standard solution 2*.

**B:** The retention times of the major peaks in the chromatograms of the *Bisoprolol fumarate assay preparation* and the *Hydrochlorothiazide assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the Assay.

#### Dissolution (711)—

**Medium:** 0.1 N hydrochloric acid; 900 mL.

**Apparatus 2:** 75 rpm.

**Times:** 20 minutes for bisoprolol fumarate; 30 minutes for hydrochlorothiazide.

**Triethylamine solution**—Mix 2 mL of triethylamine with 1000 mL of water, and adjust with phosphoric acid to a pH of 3.0.

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and *Triethylamine solution* (1:4). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard stock solution 1**—Quantitatively dissolve an accurately weighed quantity of USP Bisoprolol Fumarate RS in *Medium* to obtain a solution having a known concentration of about 0.5 mg per mL.

**Standard stock solution 2**—Transfer about 30 mg of USP Hydrochlorothiazide RS, accurately weighed, to a 50-mL volumetric flask, dissolve in 5 mL of methanol, dilute with *Medium* to volume, and mix.

**Standard solution**—Dilute accurately measured volumes of *Standard stock solution 1* and *Standard stock solution 2* with *Medium* to obtain a solution having known concentrations of bisoprolol fumarate and hydrochlorothiazide corresponding to those of the solution under test.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a UV detector capable of measuring peak responses at 227 nm and 272 nm, simultaneously, and a 3.9-mm  $\times$  15-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak areas as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the filtered portions of the solution under test into the chromatograph, record the chromatograms, and measure the peak areas for bisoprolol at 227 nm and for hydrochlorothiazide at 272 nm. Calculate the quantities, in mg, of bisoprolol fumarate  $(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$  and hydrochlorothiazide  $(C_7H_8ClN_3O_4S_2)$  dissolved.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $(C_{18}H_{31}NO_4)_2 \cdot C_4H_4O_4$  is dissolved in 20 minutes and not less than 80% (Q) of the labeled amount of  $C_7H_8ClN_3O_4S_2$  is dissolved in 30 minutes.

**Uniformity of dosage units (905):** Meet the requirements with respect to bisoprolol fumarate and to hydrochlorothiazide.

#### Chromatographic purity—

**Diluent, Solution A, Solution B, Mobile phase, and System suitability solution**—Proceed as directed in the Assay.

**Standard solution**—Dissolve an accurately weighed quantity of USP Hydrochlorothiazide RS in *Diluent*, and quantitatively dilute with *Diluent*, if necessary, to obtain a solution having a known concentration of about 2  $\mu$ g per mL.

**Test stock solution**—Proceed as directed for Assay stock preparation in the Assay.

**Test solution**—Quantitatively dilute an accurately measured volume of the *Test stock solution* with *Diluent* to obtain a solution having a concentration of about 100  $\mu$ g of bisoprolol fumarate per mL.

**Chromatographic system** (see *Chromatography* (621))—Prepare as directed in the Assay, but use a 260-nm detector. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between chlorothiazide and hydrochlorothiazide is not less than 1.5. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.3; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the re-

sponses for all the peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$(100/F)(W_B / W_H)(C_S / C_B)(r_i / r_S)$$

in which  $F$  is the response factor, equal to 1.2 for the peak with a relative retention time of 0.69 and 1.4 for the peak with a relative retention time of 1.2, both retention times relative to that of the hydrochlorothiazide peak;  $W_B$  and  $W_H$  are the labeled quantities, in mg, of bisoprolol fumarate and hydrochlorothiazide, respectively, in each Tablet;  $C_S$  is the concentration, in mg per mL, of USP Hydrochlorothiazide RS in the *Standard solution*;  $C_B$  is the concentration, in mg per mL, of bisoprolol fumarate in the *Test solution*;  $r_i$  is the peak response of each of the two impurities obtained from the *Test solution*; and  $r_S$  is the response for the hydrochlorothiazide peak obtained from the *Standard solution*: not more than 1.0% for the impurity with a relative retention time of 0.69 is found; and not more than 2.0% for the impurity with a relative retention time of 1.2 is found.

#### Assay—

**Diluent**—Mix 10 mL of 1 M dibutylammonium phosphate with 1000 mL of a mixture of water and acetonitrile (1:1).

**Solution A**—Mix 10 mL of 1 M dibutylammonium phosphate with 1000 mL of water.

**Solution B**—Prepare a mixture of acetonitrile and water (3:2). Add 10 mL of 1 M dibutylammonium phosphate per liter, stir vigorously for 2 minutes, filter, and degas.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Prepare a solution of USP Chlorothiazide RS and USP Hydrochlorothiazide RS in *Diluent* containing 40 µg of each per mL.

**Standard preparation**—Dissolve suitable quantities of USP Bisoprolol Fumarate RS and USP Hydrochlorothiazide RS in *Diluent* to obtain a solution having known concentrations of about 100 µg of each per mL. Stir by mechanical means for 1 hour.

**Assay stock preparation**—Weigh 10 Tablets, and transfer to a 100-mL volumetric flask. Add about 50 mL of *Diluent*, sonicate for 10 minutes, and cool. Dilute with *Diluent* to volume, stir by mechanical means for 1 hour, and centrifuge.

**Bisoprolol fumarate assay preparation**—Quantitatively transfer a portion of the *Assay stock preparation* to a 50-mL volumetric flask, and dilute with *Diluent* to volume to obtain a solution having a concentration of about 100 µg of bisoprolol fumarate per mL.

**Hydrochlorothiazide assay preparation**—Quantitatively transfer a portion of the *Assay stock preparation* to a 50-mL volumetric flask, and dilute with *Diluent* to volume to obtain a solution having a concentration of about 62.5 µg of hydrochlorothiazide per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with 225-nm detector and an 8-mm × 10-cm column that contains packing L11. The flow rate is about 3 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–9.0	100→40	0→60	linear gradient
9.0–9.1	40→100	60→0	linear gradient
9.1–12.0	100	0	re-equilibration

Chromatograph the *System suitability solution*, and record the peak areas as directed for *Procedure*: the resolution,  $R$ , between chlorothiazide and hydrochlorothiazide is not less than 1.5. Chromatograph the *Standard preparation*, and re-

cord the peak areas as directed for *Procedure*: the tailing factor for the hydrochlorothiazide peak is not more than 1.3; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation*, *Bisoprolol fumarate assay preparation*, and *Hydrochlorothiazide assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantities, in mg, of bisoprolol fumarate ( $C_{18}H_{31}NO_4$ )<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub> and hydrochlorothiazide (C<sub>7</sub>H<sub>8</sub>ClN<sub>3</sub>O<sub>4</sub>S<sub>2</sub>) in the portion of Tablets taken by the formula:

$$5000(C/V)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Bisoprolol Fumarate RS or USP Hydrochlorothiazide RS in the *Standard preparation*, as appropriate;  $V$  is the volume of the *Assay stock preparation* used to prepare the *Bisoprolol fumarate assay preparation* or the *Hydrochlorothiazide assay preparation*;  $r_U$  is the peak area obtained from the *Bisoprolol fumarate assay preparation* or the *Hydrochlorothiazide assay preparation*, as appropriate; and  $r_S$  is the corresponding peak area obtained from the *Standard preparation*.

## Bleomycin Sulfate

Bleomycin sulfate (salt).

Bleomycin sulfate (salt) [9041-93-4].

» Bleomycin Sulfate is the sulfate salt of bleomycin, a mixture of basic cytotoxic glycopeptides produced by the growth of *Streptomyces verticillus*, or produced by other means. It has a potency of not less than 1.5 Bleomycin Units and not more than 2.0 Bleomycin Units per mg.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

#### USP Reference standards (11)—

USP Bleomycin Sulfate RS

USP Endotoxin RS

#### Identification—

**A:** *Infrared Absorption* (197K).

**B:** It responds to the tests for *Sulfate* (191).

**pH** (791): between 4.5 and 6.0, in a solution containing 10 Bleomycin Units per mL.

**Loss on drying** (731)—Dry it in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 6.0% of its weight.

#### Copper—

**Dilute nitric acid**—Dilute 20 mL of nitric acid to 2000 mL with water.

**Copper stock solution**—Transfer 1.000 g of copper to a 1000-mL volumetric flask, dissolve in 20 mL of nitric acid, dilute with *Dilute nitric acid* to volume, and mix. Store in a polyethylene bottle. This solution contains 1000 µg of copper per mL.

**Standard preparations**—Transfer 5.0 mL of *Copper stock solution* to a 100-mL volumetric flask, dilute with *Dilute nitric acid* to volume, and mix. Transfer 3.0, 9.0, and 15.0 mL, respectively, of this solution to separate 100-mL volumetric flasks, dilute the contents of each flask with *Dilute nitric acid* to volume, and mix. These *Standard preparations* contain, respectively, 1.5, 4.5, and 7.5 µg of copper per mL.

**Test preparation**—Dissolve about 75 mg of Bleomycin Sulfate, accurately weighed, in 10.0 mL of *Dilute nitric acid*.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparations* and the *Test preparation* at the copper emission line at 324.8 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a copper hollow-cathode lamp and an air-acetylene flame, using *Dilute nitric acid* as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of copper, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C, in µg per mL, of copper in the *Test preparation*. Calculate the percentage of copper in the portion of Bleomycin Sulfate taken by the formula:

$$C / W$$

in which *W* is the weight, in mg, of Bleomycin Sulfate taken to prepare the *Test preparation*: not more than 0.1% is found.

#### Content of bleomycins—

**Mobile phase**—Dissolve 960 mg of sodium 1-pentane-sulfonate in 1000 mL of deaerated 0.08 N acetic acid, adjust with ammonium hydroxide to a pH of 4.3, filter, and degas. [NOTE—1.86 g of edetate disodium may be included if needed to obtain satisfactory chromatography.] Use a linear gradient of 10% to 40% methanol mixed with this solution, with a gradient mixing time of 60 minutes, and allow chromatography to proceed with the final gradient mixture for a further 20 minutes or until demethylbleomycin A<sub>2</sub> has been eluted.

**Test preparation**—Dissolve Bleomycin Sulfate in deaerated water to obtain a solution having a concentration of about 2.5 Bleomycin Units per mL. Store this solution in a refrigerator until just prior to use.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 250-mm stainless steel column containing packing L1. The flow rate is about 1.2 mL per minute.

**Procedure**—Inject about 10 µL of the *Test preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, record the chromatogram, and measure the peak responses for all peaks. The elution order is bleomycinic acid, bleomycin A<sub>2</sub> (major peak), bleomycin A<sub>5</sub>, bleomycin B<sub>2</sub> (major peak), bleomycin B<sub>4</sub>, and demethylbleomycin A<sub>2</sub>. Calculate the percentage contents of bleomycin A<sub>2</sub>, bleomycin B<sub>2</sub>, and bleomycin B<sub>4</sub> taken by the formula:

$$100r_i / r_t$$

in which *r<sub>i</sub>* is the peak response corresponding to the particular bleomycin and *r<sub>t</sub>* is the total of the responses of all peaks: the content of bleomycin A<sub>2</sub> is between 55% and 70%; the content of bleomycin B<sub>2</sub> is between 25% and 32%; the content of bleomycin B<sub>4</sub> is not more than 1%; and the combined percentage of bleomycin A<sub>2</sub> and bleomycin B<sub>2</sub> is not less than 90%.

**Other requirements**—Where the label states that Bleomycin Sulfate is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Bleomycin for Injection*. Where the label states that Bleomycin Sulfate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Bleomycin for Injection*.

#### Assay—

**Assay preparation**—Dissolve a suitable quantity of Bleomycin Sulfate, accurately weighed, in *Buffer No. 16*, and quantitatively dilute with *Buffer No. 16* to obtain a solution having a convenient concentration.

**Procedure**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of *Assay preparation* diluted quantitatively and stepwise with

*Buffer No. 16* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the *Standard*.

## Bleomycin for Injection

» Bleomycin for Injection contains an amount of Bleomycin Sulfate equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of bleomycin.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

#### USP Reference standards (11)—

USP Bleomycin Sulfate RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

#### Identification—

**A: Infrared Absorption** (197K).

**B:** It responds to the tests for *Sulfate* (191).

**Bacterial endotoxins** (85)—It contains not more than 10.0 USP Endotoxin Units per Bleomycin Unit.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, the entire contents of each container being used.

**Water, Method 1c** (921): not more than 6.0%. Prepare the specimen for test as follows. Use a dry syringe to inject 4 mL of anhydrous methanol through the stoppers of two tared containers, respectively, and shake to dissolve. Using the same syringe, aspirate the contents of the two containers, transfer to the titration vessel, and titrate. Perform a blank determination on 8 mL of the anhydrous methanol. Determine the weights of the empty containers, and calculate the percentage of water.

**Other requirements**—It meets the requirements for *pH*, *Copper*, and *Content of bleomycins* under *Bleomycin Sulfate*. It meets also the requirements for *Uniformity of Dosage Units* (905) and for *Labeling* under *Injections* (1).

#### Assay—

**Assay preparation**—Constitute Bleomycin for Injection as directed in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and quantitatively dilute with *Buffer No. 16* to obtain a solution having a convenient concentration.

**Procedure**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of *Assay preparation* diluted quantitatively and stepwise with *Buffer No. 16* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the *Standard*.

## Bovine Acellular Dermal Matrix

» Bovine Acellular Dermal Matrix is a remodelable collagen scaffold derived from fetal or neonatal bovine skin. It is presented to the physician as a flat white sheet that is cut to size and hydrated in room temperature sterile saline solution prior to implantation. It is utilized as a structural scaffold in orthopedic, neurosurgical, urogynecological, dermatological, plastic, and other recon-

structive procedures to contribute to the repair, reinforcement, and generation of tissue. The sterile material is surgically secured, onlayed, and/or packed into deficient soft tissues such as skin, tendon, muscle, and dura mater.

The source fetal or neonatal bovine skin is mechanically and chemically processed to isolate the dermis and remove cells and cellular components. To prevent the transmission of infectious disease, the manufacturing process has been validated to inactivate viruses potentially present in the source material. To prevent the spread of transmissible spongiform encephalopathies, the source material is acquired from appropriate geographic locations in accordance with relevant guidelines subject to governmental oversight. The product is inspected and tested to assure the product meets specifications.

**Packaging and storage**—The package is a sealed, foil pouch that provides an effective moisture, light, gas, and sterility barrier. Store in clean, dry conditions between 15° and 30°.

**Labeling**—Label it to indicate that it is derived from bovine origin. The product is labeled to indicate the product's intended clinical use. It is labeled with the dimensions of the product, the expiration date, the required storage conditions, lot number, part number, and the manufacturer's name and address. The label indicates that the product is sterile and nonpyrogenic and is designed for single patient, one-time use. The labeling cautions the user to inspect the packaging for damage and to discard the product if the packaging has been compromised. The labeling also cautions the user to hydrate the product only in room temperature sterile saline solution.

#### USP Reference standards (11)—

USP Endotoxin RS

**USP Authentic Visual References (11)**—*USP Bovine Acellular Dermal Matrix Reference Photomicrographs*. These Photomicrographs show the histological appearance of failed, cell-containing source material (Photomicrographs 1 and 2) and of passing, processed, decellularized material (Photomicrographs 3 and 4). The samples were prepared as directed in the test for *Histological evaluation*.

**Bacterial endotoxins (85)**—It meets the requirements as directed under *Transfusion and Infusion Assemblies and Similar Medical Devices (161)*.

**Sterility (71)**: meets the requirements.

#### Histological evaluation—

##### SOLUTION PREPARATIONS—

**1% Acid alcohol**—To 99 mL of 70% ethyl alcohol add 1 mL of hydrochloric acid (37.5%).

**Potassium alum solution**—Dissolve 100 g of potassium alum in 1000 mL of distilled water with the aid of heat and a magnetic stirrer.

**Hematoxylin-alcohol solution**—Dissolve 5 g of hematoxylin (see *Reagent Specifications* under *Reagents, Indicators, and Solutions*) in 50 mL of 100% ethyl alcohol at room temperature.

**Hematoxylin solution**—Slowly combine the 1000 mL of the *Potassium alum solution* with the 50 mL of the *Hematoxylin-alcohol solution*. Bring to a boil as rapidly as possible. Remove from heat and slowly add 2.5 g of mercuric oxide. Return the solution to heat until it becomes dark purple, remove from heat, and cool in a sink of cold water.

**Eosin solution**—Dissolve 1.0 g of eosin Y, water soluble, in 100 mL of distilled water. Dissolve 1.0 g of phloxine B in

100.0 mL of distilled water. Combine 100 mL of eosin Y solution with 10 mL of phloxine B solution, 780 mL of 95% ethyl alcohol, and 4.0 mL of glacial acetic acid. [NOTE—Filter daily before use.]

**Bluing agent**—Dissolve 1.54 g of lithium carbonate in 100 mL of distilled water.

**10% Neutral buffered formalin**—To 6.5 g of dibasic sodium phosphate (anhydrous) and 4.0 g of monobasic sodium phosphate, add 900 mL of distilled water and 100 mL of formaldehyde (37% to 40%).

**SAMPLE PREPARATION AND STAINING**—Remove a sample of finished product with an 8.0-mm biopsy punch. Place the sample in a labeled tissue cassette, and fix for 24 hours in *10% Neutral buffered formalin*. Dehydrate the sample in sequential soaks of the following: 70% ethyl alcohol (45 minutes), 80% ethyl alcohol (45 minutes), 95% ethyl alcohol (90 minutes), 100% ethyl alcohol (180 minutes), and xylene (90 minutes). Embed the sample in melted paraffin, cool, and cut 5- $\mu$ m thick sections with a microtome. Collect sections on microscope slides. Deparaffinize the slide with xylene and hydrate with distilled water. Stain in *Hematoxylin solution* for 6 to 15 minutes. Wash in running tap water for 2 to 5 minutes. Stain in *Eosin solution* for 1 to 2 minutes. Wash in running tap water for 2 to 5 minutes. Dip two times in *1% Acid alcohol*. Wash briefly in tap water. Place in *Bluing agent* until the sections are bright blue. Wash in running tap water for 10 minutes. Place in 80% ethyl alcohol for 1 to 2 minutes. Dehydrate and clear through two changes each of 95% ethyl alcohol, 100% ethyl alcohol, and xylene, 2 minutes each. Affix a coverslip over the tissue using an appropriate resinous mounting media. The nuclei stains blue, the cytoplasm stains from pink to red, and the collagen fibers stain from pink to red.

**MICROSCOPIC AND MORPHOLOGICAL CHARACTERISTICS**—The collagen fibers of the Bovine Acellular Dermal Matrix stain pink-red, and no evidence of cell nuclei or cytoplasm are apparent in prepared histological sections as shown in the USP Bovine Acellular Dermal Matrix Reference Photomicrographs of products with acceptable histological appearance.

**Protein determination**—Use the Kjeldahl nitrogen (protein) determination method to calculate the percent protein of the final product as directed under *Nitrogen Determination (461)* with the following specifics. Suitable equipment and procedures are readily available.<sup>1</sup>

**Digestion**—Prepare a rack of 15 to 20 Kjeldahl digestion tubes. In each, place 2.0 to 2.2 g of final product, 0.2  $\pm$  0.05 g of ammonium sulfate, a metallic catalyst tablet,<sup>2</sup> and boiling chips.<sup>3</sup> Prepare a blank tube with catalyst tablets and boiling chips (reagent blank). To each tube add 15 mL of concentrated sulfuric acid, and then, very slowly, 3 mL of hydrogen peroxide (30% to 35%). Place the digestion tubes on a digestion block, and heat to 410°. Digest for 60  $\pm$  5 minutes. The mixture in the tubes should be a clear green.

**Distillation**—Add excess base (50% sodium hydroxide). Generally, for each 5 mL of concentrated sulfuric acid used in the digestion, 20 mL of 40% (w/w) sodium hydroxide is required to make the digest strongly alkaline (pH >11). Mix each tube and let cool to room temperature. Distill each tube to collect approximately 125 mL of total distillate in a flask containing 25 mL of 4% boric acid. A reagent blank is run with each set.

**Titration**—Titrate the collected distillate with standardized 0.2 N sulfuric acid to a neutral gray color endpoint. Record the volume of sulfuric acid used.

<sup>1</sup>A suitable device and associated procedures can be obtained from Labconco, 8811 Prospect Ave., Kansas City, MO.

<sup>2</sup>A suitable catalyst is Pro-Pac CT-37, Alfie Packers, 8901 J St., Omaha, NE.

<sup>3</sup>Commonly referred to as Henger granules.

**Calculation**—Calculate the percentage of protein by the formula:

$$\text{Protein \%} = [\text{mL of sulfuric acid} - \text{mL blank}] \times \text{N of sulfuric acid} \times 1.4007 \times 6.25 / \text{weight of sample (g)}$$

where 1.4007 is the milliequivalent weight  $\text{N} \times 100(\%)$ ; and 6.25 is the protein factor for meat. The percentage of protein in 2.0 to 2.2 g of Bovine Acellular Dermal Matrix sample is between 90.0% and 95.0%.

**Lipid analysis**—A standard Soxhlet extraction apparatus is required. Dry flasks in an oven/dessicator and weigh, recording the weight to the nearest 0.0001 g. Grind or cut into small pieces 3.0 to 4.0 g of test material and place into a thimble. Record the weight of the test material to the nearest 0.0001 g. Place the thimble of material and 80 to 90 mL of petroleum ether into an extraction flask, and place into the Soxhlet extraction tube. Reflux for 4 hours. Collect all of the ether into the flask, and evaporate. Weigh the flask, recording weight to the nearest 0.0001 g.

**Calculation**—For the weight of lipid, subtract the weight of the clean flask from the final weight of the flask. Calculate the percent of lipid based on the weight of the starting material. The percentage of lipid in 3.0 to 4.0 g of Bovine Acellular Dermal Matrix sample is between 0% and 1.5%.

**Moisture content**—Proceed as directed under *Loss on Drying* (731) to calculate the moisture content, with the following specifics. Mince approximately 5.0 g of Bovine Acellular Dermal Matrix; place it into an aluminum dish. Dry the sample in an air oven for 16 to 18 hours at 100° to 102°.

**Calculation**—Calculate the percentage of moisture in the sample taken by the formula:

$$\text{Dry matter \%} = [(\text{wt. of dried sample \& pan (g)} - \text{wt. of pan (g)}) / \text{g of sample}] \times 100$$

$$\text{Moisture \%} = 100 - (\text{dry matter \%}).$$

The moisture loss is not less than 10.0% and not more than 12.0% of the original sample weight.

**Ash determination**—Place a sample of the final product, about 5.0 g, in a kiln-dried, porcelain crucible. Record the weight to the nearest 0.0001 g. Place the crucible containing the sample into an oven at 125° for 2 to 4 hours. Then place the crucible containing the sample into a cool muffle furnace. Heat the furnace to 350°, and maintain the temperature until smoking ceases (generally about 20 minutes). Heat the furnace to 550°. Maintain the temperature for 2 hours. Cool the crucible in a desiccator. Weigh the crucible, and record the weight to the nearest 0.0001 g.

**Calculation**—Calculate the percentage of ash by the following formula:

$$\text{Ash \%} = [(\text{wt. of crucible \& residue (g)} - \text{wt. of crucible (g)}) / \text{g of sample}] \times 100$$

The percentage of ash is between 0% and 0.3%.

#### **Carbohydrates**

**Calculation**—The percentage of carbohydrates is determined by the following formula:

$$\text{Carbohydrate \%} = 100\% - (\text{lipid \%} + \text{protein \%} + \text{moisture \%} + \text{ash \%})$$

The percentage of carbohydrates is equal to or less than 0.0%. Because this is a calculated value, influenced by the error inherent in the test methods above (*Lipid analysis*, *Moisture content*, and *Ash determination*), a calculated value less than 0.0% is acceptable.

**Gel electrophoresis**—Use the electrophoresis determination method as directed under *Biotechnology Derived Arti-*

*cles*—*Polyacrylamide Gel Electrophoresis* (1056) with the following specifics.

#### **SOLUTION PREPARATIONS**

**Collagen extraction solution**—Prepare a 0.5 M acetic acid solution containing 2 mM ethylenediaminetetraacetic acid (EDTA).

**2X Tris-glycine sample buffer**—Prepare a 2X solution containing 63 mM Tris-HCl pH 6.8, 10% glycerol, 2% sodium dodecyl sulfate (SDS), 0.05% 2-mercaptoethanol, and 0.25% bromophenol blue.<sup>4</sup>

**1X Sample buffer**—Prepare a solution containing a mixture of 2X *Tris-glycine sample buffer* and water (1:1).

**SDS-PAGE running buffer**—Prepare a solution containing 25 mM Tris pH 8.3, 192 mM glycine, and 0.1% SDS.<sup>5</sup>

**Polyacrylamide gel**—Prepare a Tris-HCl polyacrylamide gel with a 4% to 20% gradient.<sup>6</sup>

**Molecular weight marker**—Use a suitable molecular weight marker containing protein bands between 10 and 250 kilodaltons (kDa).

**Staining solution**—Prepare a solution containing 0.25% (w/v) Coomassie brilliant blue R-250 (see *Reagent Specifications under Reagents, Indicators, and Solutions*) in 10% acetic acid and 10% *n*-propanol.

**Destain solution**—Prepare a mixture of water, acetic acid, and *n*-propanol (8:1:1).

**COLLAGEN PREPARATIONS**—Mince 0.5 g of Bovine Acellular Dermal Matrix final product. Weigh a sample of minced Bovine Acellular Dermal Matrix, and add to a volume of *Collagen extraction solution* to obtain a concentration of 5 mg per mL (dry weight of Bovine Acellular Dermal Matrix). Extract on a rocking platform at room temperature for 72 hours.

**Procedure**—Dilute acid-extracted collagen samples in 2X *Tris-glycine sample buffer* to a concentration of 0.5 mg per mL, and incubate for 5 minutes at 100°. Load the *Polyacrylamide gel* in the electrophoresis apparatus, and add *SDS-PAGE running buffer* to the top and bottom reservoirs. Load 10 µL of *Molecular weight markers* in the first well of the *Polyacrylamide gel* and 10 µL of 1X *Sample buffer* in the second well. Load 10 µL (5 µg) of each collagen sample into subsequent gel wells. Attach the cathode and anode to the appropriate terminals, and apply 110 V to the gel. Run the gel until the bromophenol blue reaches the bottom of the gel. Remove the gel from the electrophoresis apparatus, and place it in a tray containing enough *Staining solution* to cover the gel. Incubate the gel for 3 hours on a rocker at room temperature. Completely remove the *Staining solution* from the tray, cover the gel with *Destain solution*, and slowly rock the gel for 20 minutes. Remove the *Destain solution*, and repeat the destaining procedure three times. Inspect the gel for bands that have migrated from the origin.

**System suitability**—All bands between 20 and 200 kDa are present. The lane containing 1X *Sample buffer* does not contain any bands.

**Data analysis**—Where a protein band appears in the gel, the molecular weight of this protein is determined by comparing the position of the band to that of the known *Molecular weight marker*.

**Specificity**—The lanes of the *Polyacrylamide gel* that correspond to Bovine Acellular Dermal Matrix show four major protein bands. Two bands, when compared to the *Molecular weight marker*, appear at 96 and 94 kDa. These two bands correspond to the monomeric alpha 1 and alpha 2 chains of collagen Type I, respectively. Another two bands appear close together at 200 kDa, which correspond to alpha 1 and alpha 1/alpha 2 collagen dimers.

<sup>4</sup>A suitable sample buffer can be obtained from Invitrogen Corporation, 1600 Faraday Ave., P.O. Box 6482, Carlsbad, CA 92008.

<sup>5</sup>A suitable gel running buffer can be obtained from Bio-Rad Laboratories, 1000 Alfred Nobel Dr., Hercules, CA 94547.

<sup>6</sup>A suitable precast acrylamide gel can be obtained from Bio-Rad Laboratories, 1000 Alfred Nobel Dr., Hercules, CA 94547.

**Tensile strength**—Cut test specimens 5-mm wide  $\times$  50-mm long from representative pieces from final product lots. Measure the thickness of the specimen. Test the specimens with a commercially available material test system.<sup>7</sup> Mount and align the specimen, gripping 1 cm of the test specimen on both ends to ensure a test specimen gauge length of 3 cm. Pull the grips apart at 30 mm per minute while concurrently measuring the force exerted on the specimen. Record the maximum force (N) measured during the test.

**Calculation**—Calculate the tensile strength by the formula:

$$\text{Tensile strength (N/mm}^2\text{)} = \text{maximum force (N)} / 5 \text{ (mm)} \times \text{thickness (mm)}$$

The measured tensile strength for each lot is not less than 5 N per mm<sup>2</sup>.

**Suture retention force**—Cut representative 1  $\times$  1 cm test specimens from final product lots. Using an appropriate suture material (e.g., 4-0 polypropylene suture), thread the suture 3 mm from the edge of the sample in the center and pull through. Clamp approximately 5 mm of the opposite, unsutured end of the test specimen in the upper pneumatic grip of a commercially available material test system.<sup>8</sup> The suture tails are hanging freely. Clamp the suture tails to the lower grip. Pull the grips apart at 20 mm per minute while concurrently measuring the force exerted. Record the maximum force (N) measured. The suture retention force measured for each lot is not less than 5 N for a 1  $\times$  1 cm test sample of the Bovine Acellular Dermal Matrix.

**Thermal analysis**—A final product sample of approximately 10 to 20 mg is heated at 2° per minute from 30° to 90°, hydrated with water, and the thermal characteristics of each processed skin is measured with a differential scanning calorimeter as directed under *Thermal Analysis* (891). Bovine Acellular Dermal Matrix displays a single thermal transition peak between 58° and 67°.

**Visual inspection**—Each piece of final product is visually inspected under a white light at a distance of 30 to 45 cm for color, the presence of particulates, and holes. Bovine Acellular Dermal Matrix is white, and neither particulates nor holes are visible.

**Hydration rate**—Cut a sample of finished product lot approximately 1  $\times$  1 cm. The sample fully hydrates, as indicated by a change in color from white to gray, in less than 3 minutes when placed in room temperature saline solution.

## Bretylum Tosylate

C<sub>18</sub>H<sub>24</sub>BrNO<sub>3</sub>S 414.36

Benzenemethanaminium, 2-bromo-N-ethyl-N,N-dimethyl-, salt with 4-methylbenzenesulfonic acid (1:1). (o-Bromobenzyl)ethyldimethylammonium *p*-toluenesulfonate [61-75-6].

» Bretylum Tosylate contains not less than 98.0 percent and not more than 101.0 percent of C<sub>18</sub>H<sub>24</sub>BrNO<sub>3</sub>S, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

<sup>7</sup>A suitable material test system is available from Instron Corporation, 825 University Ave., Norwood, MA.

<sup>8</sup>A suitable material test system is available from Instron Corporation, 825 University Ave., Norwood, MA.

## USP Reference standards (11)—

USP Bretylum Tosylate RS

### Identification—

**A: Infrared Absorption** (197K).

**B:** The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the test for *Related compounds*.

**Loss on drying** (731)—Dry it in vacuum at 75° for 2 hours: it loses not more than 3.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method I** (231): 0.002%.

### Related compounds—

**0.01 M Sodium 1-octanesulfonate solution**—Dissolve 1.0814 g of 1-sodium octanesulfonate in 500 mL of water.

**Mobile phase**—Prepare a mixture of 0.01 M Sodium 1-octanesulfonate solution, acetonitrile, glacial acetic acid, and triethylamine (81:19:2:0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve an accurately weighed quantity of USP Bretylum Tosylate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 20 µg per mL.

**Test solution**—Transfer about 200 mg of Bretylum Tosylate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 265-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L11. The flow rate is about 1.9 mL per minute. Chromatograph the *Standard solution*, record the chromatograms, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 30 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the peak responses. The relative retention times are about 0.25, 0.74, 1.0, 1.27, 1.40 for tosylate ion, o-bromobenzylidimethylamine, bretylum, m-bromobenzylidimethylamine, and p-bromobenzylidimethylamine, respectively. The sum of the responses for all the peaks, excluding those of the bretylum and tosylate peaks, from the *Test solution* is not more than two times the bretylum response from the *Standard solution* (2%); and no individual peak response is greater than that of the bretylum peak from the *Standard solution* (1%).

**Assay**—Dissolve about 300 mg of Bretylum Tosylate, accurately weighed, in 50 mL of dioxane in a conical flask. Add 2 drops of crystal violet TS, and titrate with 0.025 N perchloric acid in dioxane to a blue-green endpoint. Perform a blank determination (see *Titrimetry* (541)), and make any necessary correction. Each mL of 0.025 N perchloric acid is equivalent to 10.36 mg of C<sub>18</sub>H<sub>24</sub>BrNO<sub>3</sub>S.

## Bretylum Tosylate Injection

» Bretylum Tosylate Injection is a sterile solution of Bretylum Tosylate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>18</sub>H<sub>24</sub>BrNO<sub>3</sub>S.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

## USP Reference standards (11)—

USP Bretylum Tosylate RS

USP Endotoxin RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.20 USP Endotoxin Unit per mg of bretylium tosylate.

**pH** (791): between 3.5 and 7.0.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**pH 3.1 Tetramethylammonium phosphate buffer**—Dissolve 1.38 g of monobasic sodium phosphate and 2.0 mL of 25% tetra-methylammonium hydroxide solution in methanol in 800 mL of water, adjust with phosphoric acid to a pH of 3.1  $\pm$  0.1, dilute with water to 1000 mL, and mix.

**Mobile phase**—Transfer 15 mL of tetrahydrofuran and 75 mL of acetonitrile to a 1000-mL volumetric flask, and dilute with pH 3.1 Tetramethylammonium phosphate buffer to volume.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Bretylium Tosylate RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.2 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of bretylium tosylate, to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for tosylate and 1.0 for bretylium; the resolution, *R*, between the bretylium and tosylate peaks is not less than 3.0; and the relative standard deviation for replicate injections is not more than 1.4%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{18}H_{24}BrNO_3S$  in each mL of the Injection taken by the formula:

$$50(C/V)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Bretylium Tosylate RS in the *Standard preparation*; *V* is the volume, in mL, of Injection taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the bretylium peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bretylium Tosylate in Dextrose Injection

» Bretylium Tosylate in Dextrose Injection is a sterile solution of Bretylium Tosylate and Dextrose in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of bretylium tosylate ( $C_{18}H_{24}BrNO_3S$ ) and dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ). It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

#### USP Reference standards (11)—

USP Bretylium Tosylate RS

USP Endotoxin RS

#### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for bretylium tosylate*.

**B:** It responds to the *Identification* test under *Dextrose*.

**Bacterial endotoxins** (85)—It contains not more than 0.20 USP Endotoxin Unit per mg of bretylium tosylate.

**pH** (791): between 3.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay for bretylium tosylate—

**pH 3.1 Tetramethylammonium phosphate buffer, Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay under Bretylium Tosylate Injection*.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of bretylium tosylate, to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of bretylium tosylate ( $C_{18}H_{24}BrNO_3S$ ) in each mL of the Injection taken by the formula:

$$50(C/V)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Bretylium Tosylate RS in the *Standard preparation*; *V* is the volume, in mL, of Injection taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the bretylium peak responses from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextrose**—Transfer an accurately measured volume of Injection, containing 2 to 5 g of dextrose, to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, dilute with water to volume, and mix. Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* (781)). Calculate the percentage (g per 100 mL) of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ) in the portion of Injection taken by the formula:

$$(100/52.9)(198.17/180.16)AR$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees; 198.17 and 180.16 are the molecular weights for dextrose monohydrate and anhydrous dextrose, respectively; *A* is 100 mm divided by the length of the polarimeter tube, in mm; and *R* is the observed rotation, in degrees.

## Brinzolamide

$C_{12}H_{21}N_3O_5S_3$  383.51

2*H*-Thieno[3,2-*e*]-1,2-thiazine-6-sulfonamide, 4-(ethylamino)-3,4-dihydro-2-(3-methoxypropyl)-, 1,1-dioxide, (*R*)-.  
(*R*)-4-(Ethylamino)-3,4-dihydro-2-(3-methoxypropyl)-2*H*-thieno[3,2-*e*]-1,2-thiazine-6-sulfonamide 1,1-dioxide [138890-62-7].

» Brinzolamide contains not less than 98.0 percent and not more than 102.0 percent of  $C_{12}H_{21}N_3O_5S_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Brinzolamide RS

USP Brinzolamide Related Compound A RS

Brinzolamide (*S*)-isomer.

$C_{12}H_{21}N_3O_5S_3$  383.52

USP Brinzolamide Related Compound B RS

(*R*-4-Amino)-2,3-dihydro-2-(3-methoxypropyl)-4*H*-thieno[3,2-*e*]-thiazine-6-sulfonamide-1,1-dioxide ethandioate 1:1.

$C_{10}H_{17}N_3O_5S_3 \cdot C_2H_2O_4$  445.49

**Identification**—

**A:** Infrared Absorption (197K).

**B:** The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *System suitability solution*, as obtained in *Test 1* for Related compounds.

**Loss on drying** (731)—Dry it in vacuum at 100° to 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.002%.

**Related compounds**—

TEST 1—

**Mobile phase**—Prepare a filtered and degassed mixture of dehydrated alcohol, chromatographic solvent hexane, methanol, and diethylamine (55:40:5:0.2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Dissolve accurately weighed quantities of USP Brinzolamide RS and USP Brinzolamide Related Compound A RS in dehydrated alcohol to obtain a solution having known concentrations of about 0.4 mg per mL and 0.02 mg per mL, respectively.

**Test solution**—Transfer about 25 mg of Brinzolamide, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with dehydrated alcohol to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L51. The flow rate is about 0.75 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for brinzolamide and 1.2 for brinzolamide related compound A; the resolution, *R*, between brinzolamide and brinzolamide related compound A is not less than 1.8; the column efficiency determined from brinzolamide is not less than 2000 theoretical plates; and the tailing factor for the brinzolamide peak is not more than 1.8.

**Procedure**—Inject about 5  $\mu$ L of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas for brinzolamide and brinzolamide related compound A. Calculate the percentage of brinzolamide related compound A in the portion of Brinzolamide taken by the formula:

$$100(r_U / r_s)$$

in which  $r_U$  is the peak response for brinzolamide related compound A; and  $r_s$  is the sum of the peak responses for brinzolamide and brinzolamide related compound A: not

more than 0.5% of brinzolamide related compound A is found.

TEST 2—

**Triethylamine phosphate buffer**—Prepare as directed in the *Assay*.

**Mobile phase 1**—Prepare as directed for *Mobile phase* in the *Assay*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Mobile phase 2**—Prepare a filtered and degassed mixture of *Triethylamine phosphate buffer* and acetonitrile (65:35).

**System suitability solution**—Dissolve accurately weighed quantities of USP Brinzolamide RS and USP Brinzolamide Related Compound B RS in *Mobile phase 1* to obtain a solution having known concentrations of about 0.1 mg of each per mL.

**Test solution**—Transfer about 50 mg of Brinzolamide, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase 1* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1.0 mL per minute. Using *Mobile phase 1*, chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for brinzolamide related compound B and 1.0 for brinzolamide; the resolution, *R*, between brinzolamide and brinzolamide related compound B is not less than 2.0; the column efficiency determined from brinzolamide is not less than 1200 theoretical plates; and the tailing factor for the brinzolamide peak is not more than 2.0.

**Procedure**—Using *Mobile phase 1*, separately inject equal volumes (about 10  $\mu$ L) of *Mobile phase 1* and the *Test solution* into the chromatograph, record the chromatograms, allowing the elution to continue for 20 minutes, and measure the areas for all the peaks, excluding the peaks obtained from *Mobile phase 1*. Calculate the percentage of each impurity in the portion of Brinzolamide taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses for all the peaks: not more than 0.3% of any individual impurity is found.

Equilibrate the system with *Mobile phase 2*, inject the *Test solution* again, record the chromatograms, allowing the elution to continue for 20 minutes, and measure the areas for brinzolamide and all the peaks having a relative retention time greater than 6. Calculate the percentage of each impurity in the portion of Brinzolamide taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses for all the peaks: not more than 0.3% of any individual impurity is found; and not more than 1.0% of total impurities using *Mobile phase 1* and *Mobile phase 2* is found.

**Assay**—

**Triethylamine phosphate buffer**—Add 4.0 mL of triethylamine to 1000 mL of water, and adjust with phosphoric acid to a pH of 3.0.

**Mobile phase**—Prepare a filtered and degassed mixture of *Triethylamine phosphate buffer* and acetonitrile (75:25). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Brinzolamide RS in *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Transfer about 50 mg of Brinzolamide, accurately weighed, to a 50-mL volumetric flask, dilute with

*Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 1200 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak areas for brinzolamide. Calculate the quantity, in mg, of C<sub>12</sub>H<sub>21</sub>N<sub>3</sub>O<sub>5</sub>S<sub>3</sub> in the portion of Brinzolamide taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Brinzolamide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Brinzolamide Ophthalmic Suspension

» Brinzolamide Ophthalmic Suspension is a sterile, aqueous suspension of Brinzolamide containing a suitable antimicrobial preservative. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of brinzolamide (C<sub>12</sub>H<sub>21</sub>N<sub>3</sub>O<sub>5</sub>S<sub>3</sub>).

**Packaging and storage**—Preserve in tight containers. Store at a temperature between 4° and 30°.

### USP Reference standards <11>—

USP Brinzolamide RS

USP Brinzolamide Related Compound A RS  
Brinzolamide (S)-isomer.

C<sub>12</sub>H<sub>21</sub>N<sub>3</sub>O<sub>5</sub>S<sub>3</sub> 383.52

USP Brinzolamide Related Compound B RS

(R-4-Amino)-2,3-dihydro-2-(3-methoxypropyl)-4H-thieno  
[3,2,-e]-thiazine-6-sulfonamide-1,1-dioxide ethandioate  
1:1.

C<sub>10</sub>H<sub>17</sub>N<sub>3</sub>O<sub>5</sub>S<sub>3</sub> · C<sub>2</sub>H<sub>2</sub>O<sub>4</sub> 445.49

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** <791>: between 6.5 and 8.5.

### Related compounds—

#### TEST 1—

*Mobile phase*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in *Test 1* for *Related compounds* under *Brinzolamide*.

**Test solution**—Transfer an accurately weighed volume of Ophthalmic Suspension, equivalent to about 10 mg of brinzolamide, to a 25-mL volumetric flask, dilute with alcohol to volume, and mix.

**Procedure**—Proceed as directed in *Test 1* for *Related compounds* under *Brinzolamide*: not more than 1.5% of brinzolamide related compound A is found.

#### TEST 2—

*Buffer solution* and *Mobile phase*—Proceed as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Brinzolamide Related Compound B RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 2.5 μg per mL.

**Test solution**—Use the *Assay preparation*.

**Chromatographic system**—Proceed as directed in the *Assay*, and chromatograph the *System suitability preparation*, prepared as directed in the *Assay*, and the *Standard solution*, instead of the *Standard preparation*.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the quantity, in mg, of each impurity in the portion of Ophthalmic Suspension taken by the formula:

$$(356.46/445.49)50C(r_i / r_S)$$

in which 356.46 and 445.49 are the molecular weights of des-ethyl brinzolamide and des-ethyl brinzolamide oxalate, respectively; C is the concentration, in mg per mL, of USP Brinzolamide Related Compound B RS in the *Standard solution*;  $r_i$  is peak response for each impurity obtained from the *Test solution*; and  $r_S$  is the peak response for USP Brinzolamide Related Compound B RS obtained from the *Standard solution*: not more than 0.5% of any individual impurity is found; and not more than 2.0% of total impurities is found.

### Assay—

**Buffer solution**—Dissolve 11.75 g of ammonium acetate in about 1000 mL of water. Adjust with acetic acid to a pH of 5.2.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Brinzolamide RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

**System suitability preparation**—Dissolve an accurately weighed quantity of USP Brinzolamide Related Compound B RS in *Standard preparation* to obtain a solution having a known concentration of about 0.06 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Ophthalmic Suspension, equivalent to about 10 mg of brinzolamide, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-μm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are between 0.48 and 0.61 for brinzolamide related compound B and 1.0 for brinzolamide; the resolution,  $R$ , between brinzolamide and brinzolamide related compound B is not less than 4.5; the column efficiency is not less than 2500 theoretical plates; and the tailing factor is not more than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in

mg, of brinzolamide ( $C_{12}H_{21}N_3O_5S_3$ ) in the portion of Ophthalmic Suspension taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Brinzolamide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bromocriptine Mesylate

$C_{32}H_{40}BrN_5O_5 \cdot CH_4SO_3$  750.70  
Ergotaman-3',6',18-trione, 2-bromo-12'-hydroxy-2'-(1-methylethyl)-5'-(2-methylpropyl)-, monomethanesulfonate (salt), (5α)-; 2-Bromoergocryptine monomethanesulfonate (salt) [22260-51-1].

### DEFINITION

Bromocriptine Mesylate contains NLT 98.0% and NMT 102.0% of  $C_{32}H_{40}BrN_5O_5 \cdot CH_4SO_3$ , calculated on the dried basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197M): Undried
- B. ULTRAVIOLET ABSORPTION** (197U)  
Sample solution: 50 µg/mL in 0.1 M methanolic methanesulfonic acid  
Acceptance criteria: Meets the requirements

### ASSAY

- PROCEDURE**  
Sample solution: 600 mg of Bromocriptine Mesylate  
Analysis: Dissolve with 80 mL of a mixture of acetic anhydride and glacial acetic acid (7:1). Titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 75.07 mg of  $C_{32}H_{40}BrN_5O_5 \cdot CH_4SO_3$ .  
Acceptance criteria: 98.0%–102.0% on the dried basis

### IMPURITIES

#### Inorganic Impurities

- RESIDUE ON IGNITION** (281): NMT 0.1%
- HEAVY METALS, Method II** (231): NMT 20 ppm

#### Organic Impurities

- PROCEDURE 1: LIMIT OF METHANESULFONIC ACID CONTENT**  
Sample solution: 400 mg of Bromocriptine Mesylate  
Analysis: Dissolve with 70 mL of methanol. Titrate under nitrogen with 0.1 N methanolic potassium hydroxide VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N methanolic potassium hydroxide is equivalent to 9.61 mg of  $CH_3SO_3H$ .  
Acceptance criteria: NLT 12.5% and NMT 13.4% of  $CH_3SO_3H$  on the dried basis
- PROCEDURE 2**  
Solution A: 0.1 N citric acid solution. Adjust with hydrochloric acid to a pH of 2.0.  
Diluent: Methanol and *Solution A* (1:1)  
Solution B: Acetonitrile and 0.01 M phosphate buffer, pH 7.0 (2:3)

**Solution C:** Acetonitrile and 0.01 M phosphate buffer, pH 7.0 (3:2)

**Mobile phase:** See the gradient table below.

Time (min)	Solution B (%)	Solution C (%)
0	100	0
18	100	0
30	0	100
40	0	100
41	100	0

**System suitability solution:** 2.0 mg/mL each of α-ergocryptine and Bromocriptine Mesylate in *Diluent*

**Standard stock solution:** 46 µg/mL of USP Bromocriptine Mesylate RS in methanol and *Solution A* (1:1).

[NOTE—Dissolve in 50% of the flask volume of methanol and dilute with *Solution A* to volume.]

**Standard solution:** 4.6 µg/mL of USP Bromocriptine Mesylate RS in *Diluent* from the *Standard stock solution*

**Sample solution:** 4.6 mg/mL of Bromocriptine Mesylate in methanol and *Solution A* (1:1). [NOTE—Dissolve in 50% of the flask volume of methanol and dilute with *Solution A* to volume.]

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 300 nm

**Column:** 4.6-mm × 15-cm; 3-µm packing L1

**Flow rate:** 2 mL/min

**Injection size:** 20 µL

### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE— The relative retention times for α-ergocryptine and bromocriptine mesylate are 0.46 and 1.0, respectively.]

### Suitability requirements

**Resolution:** NLT 15 between α-ergocryptine and bromocriptine mesylate, *System suitability solution*

**Tailing factor:** NMT 1.5, *System suitability solution*

**Relative standard deviation:** NMT 10.0%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE— The relative retention times for bromocriptine and bromocriptinine are 1.0 and 1.7, respectively.] Calculate the percentage of each impurity in the portion of Bromocriptine Mesylate taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of bromocriptine from the *Standard solution*

$C_S$  = concentration of USP Bromocriptine Mesylate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Bromocriptine Mesylate in the *Sample solution* (mg/mL)

F = relative response factor equal to 1.4 for any peak eluting at a relative retention time of about 0.9 or less, and equal to 1.0 for all other peaks

### Acceptance criteria

**Individual impurities:** NMT 0.4% of bromocriptinine is found; NMT 0.1% of any individual impurity is found.

**Total impurities:** NMT 1.0%

### SPECIFIC TESTS

- COLOR OF SOLUTION** (631)

**Matching solutions:** Prepare three solutions, A, B, and C, containing, respectively, the following parts of cobal-

tous chloride CS, ferric chloride CS, cupric sulfate CS, and dilute hydrochloric acid (1 in 40).

A: 3.0: 3.0: 2.4: 31.6

B: 1.0: 2.4: 0.4: 36.2

C: 0.6: 2.4: 0: 37.0

**Sample solution:** 10 mg/mL of Bromocriptine Mesylate in methanol

**Analysis:** Compare the *Sample solution* with 10-mL portions of the *Matching solutions* in suitable matched tubes.

**Acceptance criteria:** The solution is clear and not darker in color than *Matching solutions A, B, and C*.

• **OPTICAL ROTATION, Specific Rotation (781S)**

**Sample solution:** 10 mg/mL, in a mixture of methylene chloride and methanol (1:1)

**Acceptance criteria:** +95° to +105°

• **LOSS ON DRYING**

(See *Thermal Analysis* (891).)

**Analysis:** Determine the percentage of volatile substances by thermogravimetric analysis using 10 mg of Bromocriptine Mesylate. Heat the specimen under test at the rate of 10°/min in an atmosphere of nitrogen at a flow rate of 45 mL/min. Record the thermogram from ambient temperature to 160°.

**Acceptance criteria:** It loses NMT 4.0% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, in a cold place.
- **USP REFERENCE STANDARDS (11)**  
USP Bromocriptine Mesylate RS

## Bromocriptine Mesylate Capsules

**DEFINITION**

Bromocriptine Mesylate Capsules contain bromocriptine mesylate ( $C_{32}H_{40}BrN_5O_5 \cdot CH_4SO_3$ ) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of bromocriptine ( $C_{32}H_{40}BrN_5O_5$ ).

**IDENTIFICATION**

- **A.** The principal spot of the *Sample solution* corresponds, in  $R_f$  value and color, to that of the *Standard solution*, as obtained in the test for *Organic Impurities*.

**ASSAY**

• **PROCEDURE**

Conduct this procedure without exposure to daylight and with minimum exposure to artificial light.

**Buffer:** 0.125 g/L of ammonium carbonate in water

**Mobile phase:** Acetonitrile and *Buffer* (3:2)

**Standard solution:** 1.0 mg/mL of bromocriptine from USP Bromocriptine Mesylate RS in dehydrated alcohol. Sonicate as needed.

**Sample solution:** 1.0 mg/mL of bromocriptine in methanol, prepared as follows. Remove, as completely as possible, the contents of NLT 10 Capsules. Weigh and determine the average weight per Capsule. Mix the combined contents, and transfer a weighed quantity of the powder, nominally equivalent to 50 mg of bromocriptine, to a 50-mL volumetric flask. Add 30 mL of dehydrated alcohol, and shake for 15 min. Dilute with dehydrated alcohol to volume, mix, and filter. Use this solution without delay.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 300 nm

**Column:** 4-mm × 25-cm; packing L7

**Flow rate:** 2 mL/min

**Injection volume:** 20 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount bromocriptine ( $C_{32}H_{40}BrN_5O_5$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of bromocriptine, from USP Bromocriptine Mesylate RS, in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of bromocriptine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

• **DISSOLUTION (711)**

**Medium:** 0.1 N hydrochloric acid; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 60 min

**Standard solution:** USP Bromocriptine Mesylate RS in *Medium*, at a concentration similar to the *Sample solution*. [NOTE—A volume of alcohol not to exceed 5% of the total volume of the *Standard solution* may be used to bring the *Standard* into solution before dilution with *Medium*.]

**Sample solution:** Sample per *Dissolution* (711), passed through a glass-fiber filter.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Fluorometry

**Excitation wavelength:** 315 nm

**Emission wavelength:** 445 nm

**Blank:** *Medium*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of bromocriptine mesylate ( $C_{32}H_{40}BrN_5O_5 \cdot CH_4SO_3$ ) dissolved.

**Tolerances:** NLT 75% (Q) of the labeled amount of bromocriptine mesylate ( $C_{32}H_{40}BrN_5O_5 \cdot CH_4SO_3$ ) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905)**

**Procedure for content uniformity**

Protect all solutions from light.

**Diluent:** Dissolve 1.0 g of tartaric acid in 500 mL of water, add 500 mL of methanol, and mix.

**Standard solution:** 0.04 mg/mL of USP Bromocriptine Mesylate RS in *Diluent*

**Sample solution:** Transfer the contents of 1 Capsule into a 25-mL volumetric flask. Add 15 mL of *Diluent*, and shake by mechanical means for 20 min. Dilute with *Diluent* to volume, and mix. Filter, and dilute 10.0 mL of the clear filtrate with *Diluent* to 50.0 mL.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV

**Analytical wavelength:** Maximum absorbance (about 306 nm)

Cell: 1 cm

Blank: Diluent

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*  
Calculate the percentage of the labeled amount of bromocriptine ( $C_{32}H_{40}BrN_5O_5$ ) in the Capsule taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Bromocriptine Mesylate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of bromocriptine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of bromocriptine, 654.59

$M_{r2}$  = molecular weight of bromocriptine mesylate, 750.70

**Acceptance criteria:** Meet the requirements

#### IMPURITIES

##### • ORGANIC IMPURITIES

Conduct this test without exposure to daylight and with minimum exposure to artificial light. Perform the test rapidly, preparing and spotting the *Sample solution* last.

**Standard stock solution:** 2.3 mg/mL of USP Bromocriptine Mesylate RS in methanol, equivalent to 2 mg/mL of bromocriptine

**Standard solution 1:** 0.06 mg/mL (3.0%) of bromocriptine in methanol, from *Standard stock solution*

**Standard solution 2:** 0.04 mg/mL (2.0%) of bromocriptine in methanol, from *Standard stock solution*

**Standard solution 3:** 0.02 mg/mL (1.0%) of bromocriptine in methanol, from *Standard stock solution*

**Standard solution 4:** 0.01 mg/mL (0.50%) of bromocriptine in methanol, from *Standard stock solution*

**Sample solution:** 2.0 mg/mL of bromocriptine in methanol, prepared as follows. Transfer a quantity of the Capsule contents, equivalent to 20 mg of bromocriptine, to a conical flask. Add 10 mL of methanol, and stir by mechanical means for 20 min. Centrifuge the suspension for 10 min at about 3500 rpm. Use the clear supernatant.

#### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 50  $\mu$ L as 1.5-cm bands

**Developing solvent:** Methylene chloride, dioxane, alcohol, and ammonium hydroxide (180:15:5:1)

**Spray reagent:** 0.2% o-phthalaldehyde in sulfuric acid

#### Analysis

**Samples:** *Standard stock solution*, *Standard solutions*, and *Sample solution*

Develop under the exclusion of light in a tank lined with filter paper, previously equilibrated for 30 min, using *Developing solvent* until the solvent front has moved a distance of 15 cm on the plate. Dry the plate briefly in a current of cold air. Spray evenly with the *Spray reagent*, and view the plate under long-wave-length UV light.

**Acceptance criteria:** Any major secondary spot, other than the principal spot, obtained from the *Sample solution* is not greater in size and intensity than the spot obtained from *Standard solution 1* (3.0%). Any remaining spots are not greater in size and intensity than the spot obtained from *Standard solution 3* (1.0%). The sum of the organic impurities is NMT 5.0%.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

- **USP REFERENCE STANDARDS** <11>  
USP Bromocriptine Mesylate RS

## Bromocriptine Mesylate Tablets

#### DEFINITION

Bromocriptine Mesylate Tablets contain bromocriptine mesylate ( $C_{32}H_{40}BrN_5O_5 \cdot CH_4SO_3$ ) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of bromocriptine ( $C_{32}H_{40}BrN_5O_5$ ).

#### IDENTIFICATION

- **A.** The principal spot of the *Sample solution* corresponds, in  $R_f$  value and color, to that of the *Standard stock solution*, as obtained in the test for *Organic Impurities*.

#### ASSAY

##### • PROCEDURE

**Buffer:** 0.01 M ammonium carbonate in water

**Mobile phase:** Acetonitrile and *Buffer* (65:35)

**Standard solution:** 0.22 mg/mL of USP Bromocriptine Mesylate RS in methanol

**Sample solution:** Transfer a quantity of powdered Tablets (NLT 20), equivalent to 10 mg of bromocriptine, to an appropriate container. Add 40 mL of methanol, and stir for 20 min, protected from light. Quantitatively filter through a fine glass filtering funnel into a 50-mL volumetric flask. Rinse the filter with methanol, adding the rinsing to the filtrate, and dilute with methanol to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 300 nm

**Column:** 4-mm  $\times$  25-cm; packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 50  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Coefficient of variation:** NMT 3.0% for 3 replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of bromocriptine ( $C_{32}H_{40}BrN_5O_5$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Bromocriptine Mesylate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of bromocriptine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of bromocriptine, 654.59

$M_{r2}$  = molecular weight of bromocriptine mesylate, 750.70

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

**Test 1:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

**Medium:** 0.1 N hydrochloric acid; 500 mL

**Apparatus 1:** 120 rpm

**Time:** 60 min

**Standard solution:** USP Bromocriptine Mesylate RS at a known concentration in *Medium*

[NOTE—A volume of alcohol not to exceed 5% of the total volume of the *Standard solution* may be used to dissolve the *Standard* before dilution with *Medium*.]

**Sample solution:** Sample per *Dissolution* <711>, passed through a glass-fiber filter.

**Blank:** *Medium*

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Fluorometry

**Excitation wavelength:** 315 nm

**Emission wavelength:** 445 nm

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*. Calculate the percentage of the labeled amount of bromocriptine ( $C_{32}H_{40}BrN_5O_5$ ) dissolved.

**Tolerances:** NLT 80% (Q) of the labeled amount of bromocriptine ( $C_{32}H_{40}BrN_5O_5$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 0.1 N hydrochloric acid; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Buffer:** 0.01 M ammonium carbonate in water

**Mobile phase:** Acetonitrile and *Buffer* (65:35)

**Standard solution:** Dissolve USP Bromocriptine Mesylate RS in methanol, and quantitatively dilute with *Medium* to obtain a solution having a known concentration similar to the expected concentration of the *Sample solution*.

**Sample solution:** Sample per *Dissolution* <711>.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 300 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 100  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*. Calculate the percentage of the labeled amount of bromocriptine ( $C_{32}H_{40}BrN_5O_5$ ) dissolved.

**Tolerances:** NLT 80% (Q) of the labeled amount of bromocriptine ( $C_{32}H_{40}BrN_5O_5$ ) is dissolved.

### • UNIFORMITY OF DOSAGE UNITS <905>

#### Procedure for content uniformity

[NOTE—Protect all solutions from light.]

**Diluent:** Dissolve 1.0 g of tartaric acid in 500 mL of water, add 500 mL of methanol, and mix.

**Standard solution:** 0.04 mg/mL of USP Bromocriptine Mesylate RS in *Diluent*

**Sample solution:** Transfer 1 Tablet into a 25-mL volumetric flask. Add 15 mL of *Diluent*, and shake by mechanical means for 30 min. Dilute with *Diluent* to volume, and mix. Filter, and dilute 10.0 mL of the clear filtrate with *Diluent* to 50.0 mL.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV

**Analytical wavelength:** 306 nm

**Cell:** 1 cm

**Blank:** *Diluent*

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*. Calculate the percentage of the labeled amount of bromocriptine ( $C_{32}H_{40}BrN_5O_5$ ) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Bromocriptine Mesylate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of bromocriptine in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of bromocriptine, 654.59

$M_{r2}$  = molecular weight of bromocriptine mesylate, 750.70

**Acceptance criteria:** Meet the requirements

### IMPURITIES

#### • ORGANIC IMPURITIES

[NOTE—Conduct this test without exposure to daylight and with minimum exposure to artificial light. Perform the test rapidly, preparing and spotting the *Sample solution* last.]

**Standard stock solution:** 1.2 mg/mL of USP Bromocriptine Mesylate RS in methanol, equivalent to 1 mg/mL of bromocriptine

**Standard solution 1:** 0.50 mg/mL (5%) of bromocriptine in methanol, from *Standard stock solution*

**Standard solution 2:** 0.30 mg/mL (3%) of bromocriptine in methanol, from *Standard stock solution*

**Standard solution 3:** 0.10 mg/mL (1%) of bromocriptine in methanol, from *Standard stock solution*

**Sample solution:** Transfer an equivalent to 20 mg of bromocriptine, from powdered Tablets, to a conical flask. Add 10 mL of methanol, and mix for 20 min. Centrifuge the suspension for 10 min at 4000 rpm. Use the clear supernatant.

#### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

#### Application volumes

**Standard solutions:** 10- $\mu$ L, as 1.5-cm bands

**Sample solution:** 50- $\mu$ L, as 1.5-cm bands

**Developing solvent system:** Methylene chloride, dioxane, alcohol, and ammonium hydroxide (180:15:5:0.1)

**Spray reagent:** 0.2% o-phthalaldehyde in sulfuric acid

#### Analysis

**Samples:** *Standard stock solution*, *Standard solutions*, and *Sample solution*

Proceed as directed in *Chromatography* <621>, *Thin-Layer Chromatography*. Dry the plate for 5 min in a current of cold air. Develop in a tank lined with filter paper, previously equilibrated for 20 min, using *Developing solvent system* until the solvent front has moved a distance of 10 cm on the plate. Dry the plate under vacuum at room temperature for 15 min. Spray evenly with the *Spray reagent*, and view the plate under long-wavelength UV light.

**Acceptance criteria:** Any spot, other than the principal spot, from the *Sample solution* is not greater in size and intensity than the spot from *Standard solution 2* (3.0%). Any remaining spots are not greater in size and intensity than the spot obtained from *Standard solution 3* (1.0%). The sum of the organic impurities is NMT 5.0%.

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **LABELING:** The labeling indicates the *Dissolution* test with which the product complies.

• **USP REFERENCE STANDARDS** <11>  
USP Bromocriptine Mesylate RS

## Bromodiphenhydramine Hydrochloride

$C_{17}H_{20}BrNO \cdot HCl$  370.71

Ethanamine, 2-(4-bromophenyl)phenylmethoxy-*N,N*-dimethyl-, hydrochloride.

2-(*p*-Bromo- $\alpha$ -phenylbenzyl)oxy-*N,N*-dimethylethylamine hydrochloride [1808-12-4].

» Bromodiphenhydramine Hydrochloride contains not less than 98.0 percent and not more than 101.0 percent of  $C_{17}H_{20}BrNO \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Bromodiphenhydramine Hydrochloride RS

**Identification**—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 15  $\mu$ g per mL.

*Medium:* 0.1 N sulfuric acid.

Absorptivities at 228 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Melting range** (741): between 148° and 152°.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Assay**—Dissolve about 700 mg of Bromodiphenhydramine Hydrochloride, accurately weighed, in 50 mL of glacial acetic acid, and add 10 mL of benzene and 15 mL of mercuric acetate TS. Add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 37.07 mg of  $C_{17}H_{20}BrNO \cdot HCl$ .

## Bromodiphenhydramine Hydrochloride Oral Solution

» Bromodiphenhydramine Hydrochloride Oral Solution contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of bromodiphenhydramine hydrochloride ( $C_{17}H_{20}BrNO \cdot HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Bromodiphenhydramine Hydrochloride RS

**Identification, Infrared Absorption** (197K)—

*Test specimen*—Transfer the final solution obtained from the titration in the Assay to a separator, add about 1 mL of 0.1 N sulfuric acid, and shake with 25 mL of ether. (Methyl red enters the ether phase.) Drain the aqueous layer into another separator, add 5 mL of 1 N sodium hydroxide, and shake with 10 mL of chloroform. Drain the chloroform layer into a small flask containing 2 g of anhydrous sodium sulfate, and swirl. Pour the chloroform solution through a small cotton pledget, pre-rinsed with chloroform, into a beaker,

and evaporate to about 5 mL. Apply a few drops of the solution directly to a potassium bromide plate, and completely remove the chloroform by warming for 2 to 3 minutes under an IR lamp.

**Alcohol content, Method I** (611): between 12.0% and 15.0% of  $C_2H_5OH$ .

**Assay**—Evaporate an accurately measured volume of Oral Solution, equivalent to about 250 mg of bromodiphenhydramine hydrochloride, to about half the original volume, using a suitable vacuum evaporator. Transfer the concentrated solution to a 250-mL separator, with the aid of sufficient warm water to bring the volume to the original volume. Add 20 g of sodium chloride, and shake until dissolved. Add 5 mL of 1 N sodium hydroxide, shake with 100 mL of ether, and drain the aqueous layer into a second separator containing 50 mL of ether. Shake, and discard the aqueous layer. Wash the ether solutions with two 20-mL portions of water, shaking each aqueous portion successively in the two separators, and then discard the aqueous solutions. Extract the ether solutions successively with 10.0 mL of 0.1 N sulfuric acid VS, followed by two 5-mL portions of water, and collect the aqueous extracts in a conical flask. Add methyl red TS to the solution in the flask, and titrate the excess acid with 0.02 N sodium hydroxide VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.1 N sulfuric acid is equivalent to 37.07 mg of bromodiphenhydramine hydrochloride ( $C_{17}H_{20}BrNO \cdot HCl$ ).

## Bromodiphenhydramine Hydrochloride and Codeine Phosphate Oral Solution

» Bromodiphenhydramine Hydrochloride and Codeine Phosphate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of bromodiphenhydramine hydrochloride ( $C_{17}H_{20}BrNO \cdot HCl$ ) and codeine phosphate hemihydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label it to indicate the alcohol content.

**USP Reference standards** (11)—

USP Bromodiphenhydramine Hydrochloride RS

USP Codeine Phosphate RS

**Identification**—

**A:** Thin-Layer Chromatographic Identification Test (201)—

*Test solution*—Transfer a volume of Oral Solution, equivalent to about 10 mg of codeine phosphate, to a separator, and add 5 mL of water, 5 mL of methylene chloride, and 1 mL of ammonium hydroxide. Shake for 1 minute, allow the layers to separate, and use the clear, lower layer.

*Standard solution*—Prepare a solution of USP Bromodiphenhydramine Hydrochloride RS and USP Codeine Phosphate RS in methanol containing 10 mg of each per mL.

*Developing solvent system:* a mixture of alcohol and ammonium hydroxide (49:1).

**B:** The retention times of the major peaks in the chromatogram of the Assay preparation correspond to those in the chromatogram of the Standard preparation, as obtained in the Assay.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*. The to-

tal aerobic microbial count does not exceed 100 cfu per mL, and the total combined molds and yeasts count does not exceed 50 cfu per mL.

**pH** (791): between 4.5 and 6.5.

**Alcohol content**, *Method II* (611): between 4.0% and 6.0% is found.

#### Assay—

**Diluent**—Prepare a mixture of methanol and water (80:20).

**Mobile phase**—Prepare a filtered and degassed mixture of methanol, water, 0.1 N ammonium hydroxide solution, and 0.1 N ammonium nitrate solution (27:3:2:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve accurately weighed quantities of USP Bromodiphenhydramine Hydrochloride RS and USP Codeine Phosphate RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 100 µg per mL and 80 µg per mL, respectively.

**Assay preparation**—Using a pipet calibrated “to contain”, transfer an accurately measured volume of Oral Solution, equivalent to about 10 mg of bromodiphenhydramine hydrochloride and 8 mg of codeine phosphate, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30.0-cm column that contains packing L3. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for bromodiphenhydramine and 1.4 for codeine; the resolution, *R*<sub>s</sub>, between bromodiphenhydramine and codeine is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for bromodiphenhydramine and codeine. Calculate the quantity, in mg, of bromodiphenhydramine hydrochloride (C<sub>17</sub>H<sub>20</sub>BrNO · HCl) in each mL of the Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Bromodiphenhydramine Hydrochloride RS in the *Standard preparation*; *V* is the volume, in mL, of Oral Solution taken to prepare the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the bromodiphenhydramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate hemihydrate (C<sub>18</sub>H<sub>21</sub>NO<sub>3</sub> · H<sub>3</sub>PO<sub>4</sub> · 1/2H<sub>2</sub>O) in each mL of the Oral Solution taken by the formula:

$$(406.37/397.36)(100C/V)(r_U / r_S)$$

in which 406.37 and 397.36 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively; *C* is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*; *V* is the volume, in mL, of Oral Solution taken to prepare the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the codeine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Brompheniramine Maleate

C<sub>16</sub>H<sub>19</sub>BrN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub> 435.31

2-Pyridinepropanamine, γ-(4-bromophenyl)-*N,N*-dimethyl-, (±)-, (*Z*)-2-butenedioate (1:1).

(±)-2-*p*-Bromo-α-2-(dimethylamino)ethylbenzylpyridine maleate (1:1) [980-71-2].

» Brompheniramine Maleate, dried at 105° for 3 hours, contains not less than 98.0 percent and not more than 100.5 percent of C<sub>16</sub>H<sub>19</sub>BrN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Brompheniramine Maleate RS

#### Identification—

**A: Infrared Absorption** (197K).

**B: Ultraviolet Absorption** (197U)—

*Solution:* 35 µg per mL.

*Medium:* methanol.

**Melting range** (741): between 130° and 135°.

**pH** (791): between 4.0 and 5.0, in a solution (1 in 100).

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.2%.

#### Related compounds—

**Test preparation**—Dissolve about 200 mg of Brompheniramine Maleate in 5 mL of methylene chloride, and mix.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 1.2-m × 4-mm glass column containing 3% phase G3 on support S1AB. The column temperature is maintained at about 190°, and the injection port and detector temperatures are both maintained at about 250°. The carrier gas is dry helium, flowing at a rate adjusted to obtain a retention time of 6 to 7 minutes for the main peak. Chromatograph the *Test preparation*, record the chromatogram, and determine the peak area as directed for *Procedure*: the tailing factor for the brompheniramine maleate peak is not more than 1.8.

**Procedure**—Inject a volume (about 1 µL) of the *Test preparation* into the chromatograph. Record the chromatogram for a total time of not less than twice the retention time of the brompheniramine peak, and measure the areas of the peaks. The total relative area of all extraneous peaks (except that of the solvent peak and maleic acid, if observed) does not exceed 2.0%.

**Assay**—Dissolve about 425 mg of Brompheniramine Maleate, previously dried and accurately weighed, in 50 mL of glacial acetic acid. Add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 21.77 mg of C<sub>16</sub>H<sub>19</sub>BrN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>.

## Brompheniramine Maleate Injection

» Brompheniramine Maleate Injection is a sterile solution of Brompheniramine Maleate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

### USP Reference standards (11)—

USP Brompheniramine Maleate RS  
USP Endotoxin RS

**Identification**—Dilute a volume of Injection, equivalent to about 50 mg of brompheniramine maleate, with dilute hydrochloric acid (1 in 1200) to 25 mL, and proceed as directed under *Identification—Organic Nitrogenous Bases* (181), beginning with “Transfer the liquid to a separator:” the Injection meets the requirements of the test.

**Bacterial endotoxins** (85)—It contains not more than 35.7 USP Endotoxin Units per mg of brompheniramine maleate.

**pH** (791): between 6.3 and 7.3.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Proceed with Injection as directed under *Salts of Organic Nitrogenous Bases* (501), to prepare the solution employed for the determination of the absorbance,  $A_u$ , at 262 nm. For the determination of  $A_s$ , dissolve about 25 mg of USP Brompheniramine Maleate RS, accurately weighed, in 20 mL of dilute sulfuric acid (1 in 350), and treat this solution the same as the portion of Injection being assayed. Calculate the quantity, in mg, of  $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$  in each mL of the Injection taken by the formula:

$$(W / V)(A_u / A_s)$$

in which  $W$  is the weight, in mg, of USP Brompheniramine Maleate RS in the *Standard Preparation*, and  $V$  is the volume, in mL, of Injection taken.

## Brompheniramine Maleate Oral Solution

» Brompheniramine Maleate Oral Solution contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of brompheniramine maleate ( $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$ ).

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

### USP Reference standards (11)—

USP Brompheniramine Maleate RS

**Identification**—Transfer a volume of Oral Solution, equivalent to about 50 mg of brompheniramine maleate, to a separator, render distinctly alkaline with 1 N sodium hydroxide, and extract with two 50-mL portions of chloroform, shaking gently to avoid emulsification. Wash the combined chloroform extracts with 10 mL of water, and discard the aqueous phase. Filter the combined chloroform extracts into a conical flask, and evaporate the solvent on a steam bath, with the aid of a current of air. To the residue add 25 mL of dilute hydrochloric acid (1 in 1200), and proceed as directed under *Identification—Organic Nitrogenous Bases* (181),

beginning with “Transfer the liquid to a separator.” The Oral Solution meets the requirements of the test.

**pH** (791): between 2.5 and 3.5.

**Alcohol content, Method I** (611): between 2.7% and 3.3% of  $C_2H_5OH$ .

**Assay**—Transfer an accurately measured volume of Oral Solution, equivalent to about 20 mg of brompheniramine maleate, to a separator, render distinctly alkaline with 1 N sodium hydroxide, and extract with ten 10-mL portions of chloroform, shaking gently to avoid emulsification. Wash the combined chloroform extracts with 10 mL of water, wash the latter with 20 mL of chloroform, and discard the aqueous phase. Quantitatively filter the combined chloroform extracts and washings into a conical flask, and evaporate the solvent on a steam bath, with the aid of a current of air. To the residue add 25 mL of glacial acetic acid and 5 mL of acetic anhydride, agitate, and allow to stand for about 15 minutes. Add 1 drop of crystal violet TS, and titrate with 0.01 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.01 N perchloric acid is equivalent to 2.177 mg of brompheniramine maleate ( $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$ ).

## Brompheniramine Maleate Tablets

» Brompheniramine Maleate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in tight containers.

### USP Reference standards (11)—

USP Brompheniramine Maleate RS

**Identification**—Tablets meet the requirements under *Identification—Organic Nitrogenous Bases* (181).

### Dissolution (711)—

*Medium*: water; 500 mL.

*Apparatus 1*: 100 rpm.

*Time*: 45 minutes.

**Procedure**—Determine the amount of  $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 264 nm on filtered portions of the solution under test, suitably diluted with 3 N hydrochloric acid, using 5-cm cuvettes, in comparison with a Standard solution having a known concentration of USP Brompheniramine Maleate RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Brompheniramine Maleate RS in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 160 µg per mL. Transfer 25.0 mL of this solution to a separator containing 25 mL of water, mix, and proceed as directed under *Assay preparation*, beginning with “adjust with sodium hydroxide solution (1 in 10) to a pH of 11.” The concentration of USP Brompheniramine Maleate RS in the *Standard preparation* is about 20 µg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 4 mg of brompheniramine maleate, mix with 50 mL of water for 10 minutes, adjust with sodium hydroxide solution (1 in 10) to a pH of 11, and cool to room temperature. Extract the mixture with two 75-mL portions

of solvent hexane, and combine the extracts in a second separator. Extract the solvent hexane solution with three 50-mL portions of dilute hydrochloric acid (1 in 120), combining the acid extracts in a 200-mL volumetric flask. Add dilute hydrochloric acid (1 in 120) to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation*, in 1-cm cells at the wavelength of maximum absorbance at about 264 nm, with a suitable spectrophotometer, using dilute hydrochloric acid (1 in 120) as the blank. Calculate the quantity, in mg, of  $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$  in the portion of Tablets taken by the formula:

$$0.2C(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Brompheniramine Maleate RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Brompheniramine Maleate and Pseudoephedrine Sulfate Oral Solution

» Brompheniramine Maleate and Pseudoephedrine Sulfate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of brompheniramine maleate ( $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$ ) and pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ].

### USP Reference standards (11)—

USP Brompheniramine Maleate RS

USP Pseudoephedrine Sulfate RS

### Identification—

**A:** The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** A solution of it meets the requirements of the test for *Sulfate* (191).

**C:** Transfer a volume of Oral Solution, equivalent to about 6 mg of brompheniramine maleate, to a separator, add 0.5 mL of ammonium hydroxide and 5 mL of methylene chloride, shake for 1 minute, and allow the layers to separate. Use the clear, lower layer as the test solution. Prepare separate Standard solutions in methanol containing, respectively, 1.2 mg of USP Brompheniramine Maleate RS and 9 mg of USP Pseudoephedrine Sulfate RS per mL. Separately apply 5  $\mu\text{L}$  of each solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of ethyl ether, methanol, and ammonium hydroxide (16:3:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wave-length UV light: the  $R_f$  values of the two principal spots obtained from the test solution correspond to those obtained from the Standard solutions.

### Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

### Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

### Assay—

**Mobile phase**—Prepare a mixture of water, acetonitrile, methanol, and tetrahydrofuran (550:320:80:50). Transfer 1.0 mL of phosphoric acid, followed by 4.33 g of dodecyl sulfate sodium to this mixture, and mix. Adjust with ammonium hydroxide to a pH of  $3.50 \pm 0.05$ , filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). [NOTE—The pH of the *Mobile phase* is critical and may cause 1 to 4 minutes of differences in the retention times of internal standard and brompheniramine maleate.]

**Internal standard solution**—Transfer about 50 mg of naphazoline hydrochloride to a 100-mL volumetric flask, add *Mobile phase* to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Brompheniramine Maleate RS in *Mobile phase*, and quantitatively dilute with *Mobile phase* to obtain a solution having a known concentration of about 6000  $\mu\text{g}$  per mL,  $I$  being the ratio of the labeled amount, in mg, of brompheniramine maleate to the labeled amount, in mg, of pseudoephedrine sulfate per mL (*Solution P*). Transfer about 30 mg of USP Pseudoephedrine Sulfate RS, accurately weighed, to a 25-mL volumetric flask, add 5.0 mL each of *Solution P* and *Internal standard solution*, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having known concentrations of about 1200  $\mu\text{g}$  of USP Brompheniramine Maleate RS per mL and about 1.2 mg of USP Pseudoephedrine Sulfate RS per mL.

**Assay preparation**—Using a “To contain” pipet transfer an accurately measured volume of Oral Solution, equivalent to about 30 mg of pseudoephedrine sulfate, to a 25-mL volumetric flask. Rinse the pipet with about 5 mL of *Mobile phase*, collecting the rinse in the volumetric flask. Add 5.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for pseudoephedrine sulfate, 1.5 for naphazoline hydrochloride, and 2.5 for brompheniramine maleate; the resolution,  $R$ , between the pseudoephedrine sulfate and naphazoline hydrochloride peaks is not less than 3, and between the brompheniramine maleate and naphazoline hydrochloride peaks is not less than 3; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of brompheniramine maleate ( $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$ ) in each mL of the Oral Solution taken by the formula:

$$25CV(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Brompheniramine Maleate RS in the *Standard preparation*;  $V$  is the volume, in mL, of Oral Solution taken; and  $R_U$  and  $R_S$  are the peak response ratios obtained for brompheniramine maleate and naphazoline hydrochloride from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of pseudoephedrine sulfate ( $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ) in each mL of the Oral Solution taken by the same formula, changing the terms to refer to pseudoephedrine sulfate.

## Budesonide

$C_{25}H_{34}O_6$  430.53  
 Pregna-1,4-diene-3,20-dione, 16 $\alpha$ ,17-[1*R*-butylidenebis(oxy)]-11 $\beta$ ,21-dihydroxy and pre-gna-1,4-diene-3,20-dione, 16 $\alpha$ ,17-[1*S*-butylidenebis(oxy)]-11 $\beta$ ,21-dihydroxy;  
 (RS)-11 $\beta$ ,16 $\alpha$ ,17,21-Tetrahydroxypregna-1,4-diene-3,20-dione cyclic 16,17-acetal with butyraldehyde [51372-29-3; 51372-28-2; 51333-22-3].

### DEFINITION

Budesonide is a mixture of two epimeric forms, epimer A (C-22S) and epimer B (C-22R). It contains NLT 40.0% and NMT 51.0% of epimer A, and the sum of both epimers is NLT 98.0% and NMT 102.0% of  $C_{25}H_{34}O_6$ , calculated on the dried basis.

[NOTE—Protect all solutions containing budesonide from light.]

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)  
 Sample solution: 25  $\mu$ g/mL  
 Medium: Methanol  
 Acceptance criteria: Meets the requirements

### ASSAY

#### • PROCEDURE

**Buffer:** 3.17 mg/mL of monobasic sodium phosphate and 0.23 mg/mL of phosphoric acid. The pH is  $3.2 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (32:68)

**Standard solution:** Dissolve a quantity of USP Budesonide RS in acetonitrile, and dilute quantitatively with *Buffer* to obtain a solution having a concentration of 0.5 mg/mL, keeping the proportion of acetonitrile in this solution to NMT 30%.

**Sample solution:** Dissolve 25 mg of Budesonide in 15 mL of acetonitrile in a 50-mL volumetric flask, and dilute with *Buffer* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention time for epimer A is 1.1, with respect to epimer B.]

#### Suitability requirements

**Resolution:** NLT 1.5 between the two budesonide epimer peaks

**Column efficiency:** NLT 5500 theoretical plates, determined from the budesonide epimer B peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of epimer A ( $C_{25}H_{34}O_6$ ) in the portion of Budesonide taken:

$$\text{Result} = [r_{UA}/(r_{UA} + r_{UB})] \times 100$$

$r_{UA}$  = peak area of epimer A from the *Sample solution*

$r_{UB}$  = peak area of epimer B from the *Sample solution*

Calculate the percentage of  $C_{25}H_{34}O_6$  in the portion of Budesonide taken:

$$\text{Result} = [(r_{UA} + r_{UB})/(r_{SA} + r_{SB})] \times (C_S/C_U) \times 100$$

$r_{UA}$  = peak area of epimer A from the *Sample solution*

$r_{UB}$  = peak area of epimer B from the *Sample solution*

$r_{SA}$  = peak area of epimer A from the *Standard solution*

$r_{SB}$  = peak area of epimer B from the *Standard solution*

$C_S$  = concentration of USP Budesonide RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Budesonide in the *Sample solution* (mg/mL)

#### Acceptance criteria

**Epimer A:** 40.0%–51.0% on the dried basis

**Both epimers:** 98.0%–102.0% on the dried basis

### IMPURITIES

#### • PROCEDURE 1: LIMIT OF 21-ACETATE OF BUDESONIDE

**Buffer:** 3.17 mg/mL of monobasic sodium phosphate and 0.23 mg/mL of phosphoric acid. The pH is  $3.2 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (45:55)

**Standard solution:** Dissolve a quantity of USP Budesonide RS in acetonitrile, and dilute quantitatively with *Buffer* to obtain a solution having a concentration of 0.5 mg/mL, keeping the proportion of acetonitrile in this solution to NMT 30%.

**Sample solution:** Dissolve 25 mg of Budesonide in 15 mL of acetonitrile in a 50-mL volumetric flask, and dilute with *Buffer* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for the first eluted epimer of the 21-acetate of budesonide, the second eluted epimer of the 21-acetate of budesonide, the first eluted epimer of budesonide (epimer B), and the second eluted epimer of budesonide (epimer A) are 3.1, 3.2, 1.0, and 1.1, respectively.]

#### Suitability requirements

**Column efficiency:** NLT 5500 theoretical plates, determined from the budesonide epimer B peak

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of the 21-acetate of budesonide in the portion of Budesonide taken:

$$\text{Result} = (r_{T1}/r_{T2}) \times 100$$

$r_{T1}$  = sum of the peak areas for the two epimers of the 21-acetate of budesonide

$r_{T2}$  = sum of the peak areas of the two budesonide peaks

**Acceptance criteria:** NMT 0.10% of the 21-acetate of budesonide is found.

#### • PROCEDURE 2: LIMIT OF 11-KETOBUDESONIDE

**Buffer:** 3.17 mg/mL of monobasic sodium phosphate and 0.23 mg/mL of phosphoric acid. The pH is  $3.2 \pm 0.1$ .

**Mobile phase:** Acetonitrile, isopropanol, and *Buffer* (26:9:65)

**Standard solution:** Dissolve a quantity of USP Budesonide RS in acetonitrile, and dilute quantitatively with *Buffer* to obtain a solution having a concentration of 0.5 mg/mL, keeping the proportion of acetonitrile in this solution to NMT 30%.

**Sample solution:** Dissolve 25 mg of Budesonide in 15 mL of acetonitrile in a 50-mL volumetric flask, and dilute with *Buffer* to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 3.5-μm packing L1

**Column temperature:** 50°

[NOTE—Preheat the *Mobile phase* to 50°.]

**Flow rate:** 1.5 mL/min

**Injection size:** 20 μL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for the two epimers of 11-ketobudesonide are 0.73 and 0.78, respectively; the relative retention times for 21-dehydrobudesonide, 14,15-dehydrobudesonide, and the first eluted epimer of budesonide (epimer B) are 0.68, 0.84, and 1.0, respectively.]

#### Suitability requirements

**Column efficiency:** NLT 5500 theoretical plates, determined from the budesonide epimer B peak

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of 11-ketobudesonide in the portion of Budesonide taken:

$$\text{Result} = (r_{T1}/r_{T2}) \times 100$$

$r_{T1}$  = sum of the peak areas for the two ketobudesonide peaks

$r_{T2}$  = sum of the peak areas of the two budesonide peaks

**Acceptance criteria:** NMT 0.2% of 11-ketobudesonide is found.

#### • PROCEDURE 3

**Buffer:** 3.17 mg/mL of monobasic sodium phosphate and 0.23 mg/mL of phosphoric acid. The pH is  $3.2 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Buffer* (32:68)

**Standard solution:** Dissolve a quantity of USP Budesonide RS in acetonitrile, and dilute quantitatively with *Buffer* to obtain a solution having a concentration of 0.5 mg/mL, keeping the proportion of acetonitrile in this solution to NMT 30%.

**Sample solution:** Dissolve 25 mg of Budesonide in 15 mL of acetonitrile in a 50-mL volumetric flask, and dilute with *Buffer* to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 20 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 5500 theoretical plates, determined from the budesonide epimer B peak

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Budesonide taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak area for each impurity

$r_T$  = sum of the areas of all of the peaks

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
16α-Hydroxyprednisolone <sup>a</sup>	0.11	0.2
D-Homobudesonide <sup>b</sup>	0.36	0.10
21-Dehydrobudesonide (epimers) <sup>c</sup>	0.61; 0.66	0.07 <sup>d</sup>
14,15-Dehydrobudesonide <sup>e</sup>	0.86	0.10
Total specified impurities	—	0.4 <sup>f</sup>
Any other individual impurity	—	0.10
Total unspecified impurities	—	0.4

<sup>a</sup> 11β,16α,17,21-Tetrahydroxypregna-1,4-diene-3,20-dione.

<sup>b</sup> 16α,17-[(1*RS*)-Butylidenebis(oxy)]-11β-hydroxy-17-(hydroxymethyl)-D-homoandrosta-1,4-diene-3,17a-dione.

<sup>c</sup> 16α,17-[(1*RS*)-Butylidenebis(oxy)]-11β-hydroxy-3,20-dioxopregna-1,4-dien-21-al.

<sup>d</sup> Limit includes both epimers.

<sup>e</sup> 16α,17-[(1*RS*)-Butylidenebis(oxy)]-11β,21-dihydroxypregna-1,4,14-triene-3,20-dione.

<sup>f</sup> Total specified impurities includes 11-ketobudesonide obtained in the test for *Limit of 11-Ketobudesonide* and the impurities listed above.

#### SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total aerobic microbial count is NMT  $10^3$  cfu/g, and the total combined molds and yeast count is NMT  $10^2$  cfu/g.
- **LOSS ON DRYING** <731>: Dry a sample at 105° to constant weight: it loses NMT 0.3% of its weight.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** <11>  
USP Budesonide RS

## Bumetanide

$C_{17}H_{20}N_2O_5S$  364.42

Benzoic acid, 3-(aminosulfonyl)-5-(butylamino)-4-phenoxy-3-(butylamino)-4-phenoxy-5-sulfamoylbenzoic acid [28395-03-1].

» Bumetanide contains not less than 98.0 percent and not more than 102.0 percent of  $C_{17}H_{20}N_2O_5S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

#### USP Reference standards <11>—

USP Bumetanide RS

USP Bumetanide Related Compound A RS

3-Amino-4-phenoxy-5-sulfamoylbenzoic acid.

$C_{13}H_{12}N_2O_5S$  308.31

USP Bumetanide Related Compound B RS

3-Nitro-4-phenoxy-5-sulfamoylbenzoic acid.

$C_{13}H_{10}N_2O_7S$  338.29

$C_{21}H_{28}N_2O_5S$  420.53

**Identification—**

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

Solution: 50 µg per mL.

Medium: isopropyl alcohol.

**C:** The principal spot obtained from the chromatogram of the *Test preparation* exhibits an  $R_f$  value corresponding to that in the chromatogram of *Standard solution 1*, as obtained in the test for *Related compounds*.

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%, a 1-g specimen being used.

**Heavy metals, Method II** (231): 0.002%.

**Related compounds—**

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture.

**Test solution—**Dissolve an accurately weighed quantity of Bumetanide in methanol to obtain a solution having a concentration of about 25 mg per mL.

**Standard solution 1—**Dissolve an accurately weighed quantity of USP Bumetanide RS in methanol to obtain a solution having a known concentration of about 25 mg per mL.

**Standard solution 2—**Dilute a volume of *Standard solution 1* quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.05 mg per mL.

**Standard solution 3—**Dissolve an accurately weighed quantity of USP Bumetanide Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.05 mg per mL.

**Standard solution 4—**Dissolve an accurately weighed quantity of USP Bumetanide Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.025 mg per mL.

**Standard solution 5—**Dissolve an accurately weighed quantity of USP Butyl 3-(butylamino)-4-phenoxy-5-sulfamoylbenzoate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.025 mg per mL.

**Application volume:** 20 µL of each solution.

**Developing solvent system:** a mixture of chloroform, cyclohexane, glacial acetic acid, and methanol (80:10:10:2.5).

**Procedure—**Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). After drying the application spots, place the plate in an unlined and unsaturated chromatographic chamber. Examine the plate under short-wavelength UV light. Any secondary spots obtained from the chromatogram of the *Test solution* having  $R_f$  values corresponding to the  $R_f$  values of the principal spots obtained from the chromatograms of *Standard solutions 3, 4, and 5* are not larger or more intense than the principal spots obtained from the chromatograms of *Standard solutions 3, 4, and 5*, respectively: not more than 0.2% of bumetanide related compound B is found; not more than 0.1% of bumetanide related compound A is found; and not more than 0.1% of butyl 3-(butylamino)-4-phenoxy-5-sulfamoylbenzoate is found. No other individual secondary spots obtained from the chromatogram of the *Test solution* are larger or more intense than the principal spot obtained from the chromatogram of *Standard solution 2*: not more than 0.2% of any other individual impurity is found; and

not more than 0.4% of the sum of all other impurities is found (excluding bumetanide related compound A, bumetanide related compound B, and butyl 3-(butylamino)-4-phenoxy-5-sulfamoylbenzoate).

**Assay—**Dissolve about 1 g of Bumetanide, accurately weighed, in 150 mL of alcohol in a 250-mL conical flask. Add phenol red TS, and titrate with 0.1 N sodium hydroxide VS. Perform a blank determination (see *Titrimetry* (541)), and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 36.44 mg of  $C_{17}H_{20}N_2O_5S$ .

## Bumetanide Injection

» Bumetanide Injection is a sterile solution of Bumetanide in Water for Injection, prepared with the aid of Sodium Hydroxide. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of bumetanide ( $C_{17}H_{20}N_2O_5S$ ).

**Packaging and storage—**Preserve in single-dose or multi-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Bumetanide RS

USP Bumetanide Related Compound A RS

3-Amino-4-phenoxy-5-sulfamoylbenzoic acid.

$C_{13}H_{12}N_2O_5S$  308.31

USP Endotoxin RS

**Identification—**

**A:** The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**B:** The principal spot obtained from the chromatogram of the *Test solution* exhibits an  $R_f$  value corresponding to that of the *Identification solution*, as obtained in the test for *Related compounds*.

**Bacterial endotoxins** (85)—It contains not more than 350 USP Endotoxin Units per mg of bumetanide.

**pH** (791): between 6.8 and 7.8.

**Related compounds—**

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture.

**Test solution—**Pipet a volume of Injection, equivalent to 5 mg of bumetanide, into a 125-mL separator, and adjust with 0.1 N sodium hydroxide to a pH of 12. Extract with two 20-mL portions of ethyl ether, discard the ethyl ether extracts, and adjust the aqueous layer with 1 N acetic acid to a pH of 4. Extract with two 20-mL portions of ethyl ether, passing the extracts through anhydrous sodium sulfate. Wash the sodium sulfate with about 5 mL of ethyl ether. Evaporate the combined ethyl ether extracts with the aid of a stream of nitrogen to dryness, and dissolve the residue in 0.5 mL of methanol.

**Identification solution—**Dissolve USP Bumetanide RS in methanol to obtain a solution having a concentration of about 10 mg per mL.

**Standard solutions—**Dilute a volume of the *Identification solution* quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.08 mg of USP Bumetanide RS per mL. Quantitatively dilute with methanol to obtain *Standard solutions* having the following compositions.

Standard solution	Dilution	Concentration ( $\mu\text{g}$ of RS per mL)	Percentage (% for comparison with test specimen)
1	undiluted	80	0.8
2	3 in 4	60	0.6
3	1 in 2	40	0.4
4	1 in 4	20	0.2
5	1 in 8	10	0.1

**Standard solution 6**—Dissolve an accurately weighed quantity of USP Bumetanide Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.02 mg per mL.

**Application volume:** 50  $\mu\text{L}$ .

**Developing solvent system:** a mixture of chloroform, cyclohexane, glacial acetic acid, and methanol (80:10:10:2.5).

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Examine the plate under short-wavelength UV light. Any secondary spot obtained from the chromatogram of the *Test solution* having an  $R_f$  value corresponding to the  $R_f$  value of the principal spot obtained from the chromatogram of *Standard solution 6* is not larger or more intense than the principal spot obtained from the chromatogram of *Standard solution 6*: not more than 0.2% of bumetanide related compound A is found. For all other secondary spots obtained from the chromatogram of the *Test solution*, compare the intensity of each spot with the principal spots obtained from the chromatograms of *Standard solutions 1* through *5*: not more than 0.2% of any individual other impurity is found; and not more than 0.8% of the sum of all other impurities is found (excluding bumetanide related compound A).

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol, water, tetrahydrofuran, and glacial acetic acid (50:45:5:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer about 50 mg of 4-ethylbenzaldehyde to a 100-mL volumetric flask. Dissolve in and dilute with methanol to volume, and mix. Transfer 10.0 mL of the resulting solution to a 100-mL volumetric flask, add 10.0 mL of tetrahydrofuran and 4.0 mL of glacial acetic acid, dilute with methanol to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Bumetanide RS in *Internal standard solution*, and quantitatively dilute with *Internal standard solution* to obtain a solution having a known concentration of about 250  $\mu\text{g}$  per mL. Transfer 5.0 mL of the resulting solution to a 10-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having a known concentration of about 125  $\mu\text{g}$  of USP Bumetanide RS per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 0.25 mg of bumetanide, to a flask. Add an equal volume of *Internal standard solution*, accurately measured, insert the stopper, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for 4-ethylbenzaldehyde and 1.0 for bumetanide; the resolution,  $R$ , between the analyte and internal standard peaks is not less than 1.5, the tailing factor for the analyte peak is not more than 1.4, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $\text{C}_{17}\text{H}_{20}\text{N}_2\text{O}_5\text{S}$  in each mL of the Injection taken by the formula:

$$(2C / V)(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Bumetanide RS in the *Standard preparation*;  $V$  is the volume, in mL, of Injection taken; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bumetanide Tablets

» Bumetanide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of bumetanide ( $\text{C}_{17}\text{H}_{20}\text{N}_2\text{O}_5\text{S}$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Bumetanide RS

USP Bumetanide Related Compound A RS

3-Amino-4-phenoxy-5-sulfamoylbenzoic acid.

$\text{C}_{13}\text{H}_{12}\text{N}_2\text{O}_5\text{S}$  308.31

#### Identification—

**A:** The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** The principal spot obtained from the chromatogram of the *Test solution* exhibits an  $R_f$  value corresponding to that of the *Identification solution*, as obtained in the test for *Related compounds*.

#### Dissolution (711)—

**Medium:** water; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

**pH 2.9 Glycine buffer**—Dissolve 7.505 g of glycine and 5.85 g of sodium chloride in water to make 1000 mL (stock solution). Dilute 80.0 mL of the stock solution and 20.0 mL of 0.1 N hydrochloric acid with water to 1000 mL. Adjust, if necessary, with 0.1 N hydrochloric acid or 0.1 N sodium hydroxide to a pH of 2.9.

**Procedure**—Determine the amount of  $\text{C}_{17}\text{H}_{20}\text{N}_2\text{O}_5\text{S}$  dissolved, by employing a suitable fluorometer having an excitation wavelength of about 350 nm and a fluorescence emission of about 450 nm on filtered portions of the solution under test, suitably diluted with *pH 2.9 Glycine buffer*, in comparison with a *Standard solution* having a known concentration of USP Bumetanide RS in the same *Medium*.

**Tolerances**—Not less than 85% (Q) of the labeled amount of  $\text{C}_{17}\text{H}_{20}\text{N}_2\text{O}_5\text{S}$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Related compounds—

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture.

**Test solution**—Transfer an accurately weighed portion of finely powdered Tablets, equivalent to 10 mg of bumetanide, to a 50-mL centrifuge tube, add 20 mL of acetone (spectrophotometric or HPLC quality), and shake by mechanical means for 10 minutes. Centrifuge for 10 minutes,

decant the supernatant into a glass-stoppered, 25-mL conical flask, and evaporate with the aid of a stream of nitrogen to dryness. Dissolve the residue in 0.5 mL of methanol.

**Identification solution**—Dissolve USP Bumetanide RS in methanol to obtain a solution having a concentration of about 20 mg per mL.

**Standard solutions**—Dilute a volume of the *Identification solution* quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.16 mg of USP Bumetanide RS per mL. Quantitatively dilute with methanol to obtain *Standard solutions* having the following compositions.

Standard solution	Dilution	Concentration ( $\mu\text{g}$ of RS per mL)	Percentage (%, for comparison with test speci- men)
1	undiluted	160	0.8
2	3 in 4	120	0.6
3	1 in 2	80	0.4
4	1 in 4	40	0.2
5	1 in 8	20	0.1

**Standard solution 6**—Dissolve an accurately weighed quantity of USP Bumetanide Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.04 mg per mL.

**Application volume:** 25  $\mu\text{L}$ .

**Developing solvent system:** a mixture of chloroform, cyclohexane, glacial acetic acid, and methanol (80:10:10:2.5).

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Examine the plate under short-wavelength UV light. Any secondary spot obtained from the chromatogram of the *Test solution* having an  $R_f$  value corresponding to the  $R_f$  value of the principal spot obtained from the chromatogram of *Standard solution 6* is not larger or more intense than the principal spot obtained from the chromatogram of *Standard solution 6*: not more than 0.2% of bumetanide related compound A is found. For all other secondary spots obtained from the chromatogram of the *Test solution*, compare the intensity of each spot with the principal spots obtained from the chromatograms of *Standard solutions 1* through *5*: not more than 0.2% of any individual other impurity is found; and not more than 0.8% of the sum of all other impurities is found (excluding bumetanide related compound A).

#### Assay—

**Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system**—Prepare as directed in the *Assay* under *Bumetanide Injection*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 0.5 mg of bumetanide, to a 10-mL volumetric flask, add 2.0 mL of *Internal standard solution*, and sonicate for 5 minutes. Add 2.0 mL of water, and mix. Cool, and filter, discarding the first 1 mL of the filtrate.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.7 for 4-ethylbenzaldehyde and 1.0 for bumetanide. Calculate the quantity, in mg, of bumetanide ( $\text{C}_{17}\text{H}_{20}\text{N}_2\text{O}_5\text{S}$ ) in the portion of Tablets taken by the formula:

$$4C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Bumetanide RS in the *Standard preparation*; and  $R_U$  and  $R_S$

are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bupivacaine Hydrochloride

$\text{C}_{18}\text{H}_{28}\text{N}_2\text{O} \cdot \text{HCl} \cdot \text{H}_2\text{O}$  342.90

2-Piperidinecarboxamide, 1-butyl-N-(2,6-dimethylphenyl)-, monohydrochloride, monohydrate, ( $\pm$ )-.

( $\pm$ )-1-Butyl-2',6'-pipecoloxylidide monohydrochloride, monohydrate [73360-54-0].

Anhydrous 324.90 [18010-40-7].

» Bupivacaine Hydrochloride contains not less than 98.5 percent and not more than 101.5 percent of  $\text{C}_{18}\text{H}_{28}\text{N}_2\text{O} \cdot \text{HCl}$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Bupivacaine Hydrochloride RS

#### Identification—

**A: Infrared Absorption** (197S)—

**Solution**—Dissolve about 230 mg in 15 mL of water in a separator, add 1 mL of 6 N ammonium hydroxide, and extract with three 30-mL portions of chloroform. Evaporate the chloroform at room temperature with the aid of a stream of nitrogen, and dry the residue in vacuum. Add 2 mL of chloroform to the residue, and dissolve.

**B: Ultraviolet Absorption** (197U)—

**Solution:** 500  $\mu\text{g}$  per mL.

**Medium:** 0.1 N hydrochloric acid.

Absorptivities at 271 nm, calculated on the anhydrous basis, do not differ by more than 3.0%.

**C:** Dissolve about 50 mg in 10 mL of water in a small separator, render alkaline with 6 N ammonium hydroxide, and extract with 10 mL of ether: the aqueous layer meets the requirements of the tests for *Chloride* (191).

**pH** (791): between 4.5 and 6.0, in a solution (1 in 100).

**Water, Method I** (921): between 4.0% and 6.0%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): not more than 0.001%.

#### Limit of residual solvents—

**Alcohol standard solution**—Pipet 2 mL of dehydrated alcohol into a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix. The resulting solution contains 0.08% of alcohol.

**Isopropyl alcohol standard solution**—Pipet 2 mL of isopropyl alcohol into a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. The resulting solution contains 0.004% of isopropyl alcohol.

**Test solution**—Transfer 1.0 g of Bupivacaine Hydrochloride, accurately weighed, to a 25-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system**—Under typical conditions, the instrument is equipped with a flame-ionization detector and a 4-mm  $\times$  2-m column that contains packing S3. The carrier gas is nitrogen, flowing at a rate of about 40 mL per min-

ute. The column temperature is maintained at about 175°, the injection port temperature is maintained at about 200°, and the detector temperature is maintained at about 280°.

**Procedure**—Inject equal volumes (about 5 µL) of the *Test solution*, the *Alcohol standard solution*, and the *Isopropyl alcohol standard solution* successively into the gas chromatograph. Measure the responses of the alcohol peak and the isopropyl alcohol peak in each chromatogram. Determine the percentage of alcohol taken by the formula:

$$2(r_U / r_S)$$

and determine the percentage of isopropyl alcohol taken by the formula:

$$0.1(r_U / r_S)$$

in which  $r_U$  and  $r_S$  are the responses of the respective analytes in the *Test solution* and of the corresponding analytes in the *Alcohol standard solution* and the *Isopropyl alcohol standard solution*, respectively. The sum of the content of alcohol and the content of isopropyl alcohol does not exceed 2%.

#### Chromatographic purity—

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture.

**Solvent:** a mixture of chloroform and isopropylamine (99:1).

**Test solution**—Dissolve a suitable quantity of Bupivacaine Hydrochloride in *Solvent* to obtain a solution containing 20.0 mg per mL.

**Standard solution**—Dissolve a suitable quantity of USP Bupivacaine Hydrochloride RS, accurately weighed, in *Solvent* to obtain a solution containing 20.0 mg per mL.

**Diluted standard solution**—Quantitatively dilute a portion of the *Standard solution* in *Solvent* to obtain a solution having a concentration of 100 µg per mL.

**Developing solvent system:** a mixture of hexanes and isopropylamine (97:3).

**Procedure**—Apply separate 10-µL portions of the *Test Solution*, the *Standard solution*, and the *Diluted standard solution* on the starting line of suitable thin-layer chromatographic plate as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Develop the chromatogram in a suitable chamber until the solvent has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and dry it in warm air. Place the plate in a closed chamber with a dish containing 1 g of iodine in a shallow layer, and allow to remain for about 5 minutes. Remove the plate from the chamber, spray it with 7 N sulfuric acid, and examine the chromatogram: the  $R_f$  value of the principal spot from the *Test solution* corresponds to that of the *Standard solution*, and the estimated size and intensity of any other spot obtained from the *Test solution* does not exceed that of the principal spot obtained from the *Diluted standard solution* (0.5%); and the total of the estimated sizes and intensities of all of the other spots obtained from the *Test solution* does not exceed four times that of the principal spot obtained from the *Diluted standard solution* (2.0%).

**Assay**—Transfer about 600 mg of Bupivacaine Hydrochloride, accurately weighed, to a 250-mL conical flask, and dissolve in 20 mL of glacial acetic acid. Add 10 mL of mercuric acetate TS and 3 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 32.49 mg of  $C_{18}H_{28}N_2O \cdot HCl$ .

## Bupivacaine Hydrochloride Injection

» Bupivacaine Hydrochloride Injection is a sterile solution of Bupivacaine Hydrochloride in Water for Injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_{18}H_{28}N_2O \cdot HCl$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass. Injection labeled to contain 0.5% or less of bupivacaine hydrochloride may be packaged in 50-mL multiple-dose containers.

#### USP Reference standards (11)—

USP Bupivacaine Hydrochloride RS

USP Endotoxin RS

#### Identification—

**A:** Dilute a volume of Injection, equivalent to about 50 mg of bupivacaine hydrochloride, with 0.01 N hydrochloric acid to 25 mL, and proceed as directed under *Identification—Organic Nitrogenous Bases* (181), beginning with "Transfer the liquid to a separator." The Injection meets the requirements of the test.

**B:** The retention time of the bupivacaine peak in the chromatogram of the *Assay preparation* corresponds to that of the bupivacaine peak in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 2.5 USP Endotoxin Units per mg of bupivacaine hydrochloride.

**pH** (791): between 4.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**pH 6.8 Phosphate buffer**—Dissolve 1.94 g of monobasic potassium phosphate and 2.48 g of dibasic potassium phosphate in 1000 mL of water. Adjust, if necessary, with 1 N potassium hydroxide or 1 M phosphoric acid to a pH of 6.8.

**Mobile phase**—Prepare a fresh solution of acetonitrile and pH 6.8 Phosphate buffer (65:35). Adjust, if necessary, with 1 M phosphoric acid to a pH of  $7.7 \pm 0.2$ . Filter the solution through a membrane filter of 1-µm or finer porosity, and degas.

**Internal standard solution**—Prepare a solution of dibutyl phthalate in methanol containing about 1.3 mg per mL.

**Standard preparation**—Dissolve about 50 mg of USP Bupivacaine Hydrochloride RS, accurately weighed, in 10.0 mL of water, using sonication if necessary, in a 100-mL volumetric flask. Add 10 mL of *Internal standard solution*, dilute with methanol to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of bupivacaine hydrochloride, to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 263-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph three replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation of the ratios of the bupivacaine hydrochloride peak to the dibutyl phthalate peak is not more than 1.0%, and the resolution  $R$ , factor, between bupivacaine hydrochloride and dibutyl phthalate is not less than 2.0.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 1.2 for dibutyl phthalate and 1.0 for bupivacaine hydrochloride. Calculate the quantity, in mg, of

$C_{18}H_{28}N_2O \cdot HCl$  in the volume of Injection taken by the formula:

$$W(R_U / R_S)$$

in which  $W$  is the weight, in mg, of USP Bupivacaine Hydrochloride RS, calculated on the anhydrous basis, in the *Standard preparation*, and  $R_U$  and  $R_S$  are the ratios of the peak responses of bupivacaine hydrochloride to those of the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Bupivacaine Hydrochloride in Dextrose Injection

» Bupivacaine Hydrochloride in Dextrose Injection is a sterile solution of Bupivacaine Hydrochloride and Dextrose in Water for Injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amounts of bupivacaine hydrochloride ( $C_{18}H_{28}N_2O \cdot HCl$ ) and dextrose ( $C_6H_{12}O_6$ ). It contains no preservative.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

### USP Reference standards <11>—

USP Bupivacaine Hydrochloride RS

USP Dextrose RS

USP Endotoxin RS

### Identification—

**A:** *Thin-Layer Chromatographic Identification Test* <201>—

**Adsorbent:** chromatographic silica gel mixture; 0.25 mm.

**Developing solvent:** mixture of butyl alcohol, water, dehydrated alcohol, and glacial acetic acid (6:2:1:1).

**Test preparation:** Bupivacaine Hydrochloride in Dextrose Injection.

**Standard preparations A, B, and C**—Separately prepare (A) a solution of USP Bupivacaine Hydrochloride RS in water, (B) a solution of USP Dextrose RS in water, and (C) a solution of USP Bupivacaine Hydrochloride RS in (B) to obtain solutions having concentrations corresponding to the labeled concentrations of bupivacaine hydrochloride and dextrose in the Injection.

**Naphthalenediol reagent**—Dissolve 20 mg of 1,3-naphthalenediol in 10 mL of dehydrated alcohol containing 0.2 mL of sulfuric acid.

**Iodoplatinate reagent**—Mix equal volumes of platinic chloride solution (3 in 1000) and potassium iodide solution (6 in 100).

**Procedure**—Separately apply 10  $\mu$ L each of the *Test preparation* and *Standard preparations A* and *C* to a portion of the chromatographic plate, and separately apply 1  $\mu$ L each of the *Test preparation* and *Standard preparation B* to the remaining portion of the plate. Dry the applications in a current of warm air, develop the chromatograms, remove the plate from the developing chamber, and mark the solvent front. Dry the plate in warm circulating air, and examine the plate under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the *Test preparation* corresponds to the spots obtained from the adjacent chromatograms of *Standard preparations A* and *C*. Spray the plate with *Naphthalenediol reagent*, heat at 90° for 5 minutes, and examine the plate: the  $R_f$  value of the principal blue-purple spot obtained from the *Test preparation* corresponds to that obtained in the adjacent chromatogram of *Standard preparation B*. Cool the plate, spray it with *Iodoplatinate reagent*,

and examine the plate: bupivacaine appears as a blue-purple spot on a salmon-colored background, and the dextrose spots fade slightly: the  $R_f$  value of the bupivacaine spot obtained from the *Test preparation* corresponds to those obtained from the adjacent chromatograms of *Standard preparations A* and *C*.

**B:** It responds to *Identification test B* under *Bupivacaine Hydrochloride Injection*.

**Bacterial endotoxins** <85>—It contains not more than 1.8 USP Endotoxin Units per mg of bupivacaine hydrochloride.

**pH** <791>: between 4.0 and 6.5.

**Other requirements**—It meets the requirements under *Injections* <1>.

### Assay for bupivacaine hydrochloride—

**pH 6.8 Phosphate buffer, Mobile phase, Internal standard solution, Standard preparation, Chromatographic system, and Procedure**—Proceed as directed in the *Assay under Bupivacaine Hydrochloride Injection*.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of bupivacaine hydrochloride, to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix.

**Assay for dextrose**—Determine the angular rotation of Injection in a suitable polarimeter tube (see *Optical Rotation* <781>). Calculate the percentage (g per 100 mL) of dextrose ( $C_6H_{12}O_6$ ) in the portion of Injection taken by the formula:

$$(100/52.9)AR$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees;  $A$  is 100 mm divided by the length of the polarimeter tube, in mm; and  $R$  is the observed rotation, in degrees.

## Bupivacaine Hydrochloride and Epinephrine Injection

» Bupivacaine Hydrochloride and Epinephrine Injection is a sterile solution of Bupivacaine Hydrochloride and Epinephrine or Epinephrine Bitartrate in Water for Injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of bupivacaine hydrochloride ( $C_{18}H_{28}N_2O \cdot HCl$ ). The content of epinephrine ( $C_9H_{13}NO_3$ ) does not exceed 0.001 percent (1 in 100,000). It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of epinephrine ( $C_9H_{13}NO_3$ ).

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light. Injection labeled to contain 0.5% or less of bupivacaine hydrochloride may be packaged in 50-mL multiple-dose containers.

**Labeling**—The label indicates that the Injection is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

### USP Reference standards <11>—

USP Bupivacaine Hydrochloride RS

USP Epinephrine Bitartrate RS

USP Endotoxin RS

**Color and clarity**—Using the Injection as the *Test solution*, proceed as directed for *Color and clarity* under *Epinephrine Injection*.

**Identification—**

**A:** It responds to the *Identification* tests under *Bupivacaine Hydrochloride Injection*.

**B:** Pipet a volume of Injection, equivalent to about 50 µg of epinephrine, into a suitable container, add 0.1 mL of *Ferro-citrate solution* and 2.0 mL of *Buffer solution* (prepared as directed under *Epinephrine Assay* (391)), mix, and allow the solution to stand for 10 minutes. Filter the solution: the filtrate is violet in color and may turn brownish.

**Bacterial endotoxins** (85)—It contains not more than 1.6 USP Endotoxin Units per mg of bupivacaine hydrochloride.

**pH** (791): between 3.3 and 5.5.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for bupivacaine hydrochloride—**

*pH 6.8 Phosphate buffer, Mobile phase, Internal standard solution, Standard preparation, Chromatographic system, and Procedure*—Proceed as directed in the Assay under *Bupivacaine Hydrochloride Injection*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of bupivacaine hydrochloride, to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix.

**Assay for epinephrine—**

*Mobile phase*—Prepare a suitably filtered and degassed mixture of water, methanol, and 2M monobasic sodium phosphate (900:50:50), containing in each 1000 mL, 40 mg of edetate disodium, 0.4 mL of phosphoric acid, and 0.4 g of sodium 1-octanesulfonate. Make adjustments, if necessary, to obtain a retention time of not less than 11 minutes for the epinephrine peak (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Epinephrine Bitartrate RS in *Mobile phase* to obtain a solution having a concentration of about 2 µg per mL.

*Resolution solution*—Dissolve suitable quantities of epinephrine bitartrate and dopamine hydrochloride in *Mobile phase* to obtain a solution containing about 2 µg of each per mL.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 25 µg of epinephrine, to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with an electrochemical detector held at a potential of +0.75 volt and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between the epinephrine and dopamine peaks is not less than 6.0; and the relative retention times are about 2 for dopamine and 1.0 for epinephrine. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of epinephrine (C<sub>9</sub>H<sub>13</sub>NO<sub>3</sub>) in each mL of the Injection taken by the formula:

$$(183.21 / 333.30)(25)(C / V)(r_U / r_S)$$

in which 183.21 and 333.30 are the molecular weights of epinephrine and epinephrine bitartrate, respectively; *C* is the concentration, in µg per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation*; *V* is the volume, in mL, of

Injection taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Buprenorphine Hydrochloride**

C<sub>29</sub>H<sub>41</sub>NO<sub>4</sub> · HCl 504.10

6,14-Ethenomorphinan-7-methanol, 17-(cyclopropylmethyl)-α-(1,1-dimethylethyl)-4,5-epoxy-18,19-dihydro-3-hydroxy-6-methoxy-α-methyl-, hydrochloride, [5α, 7α(S)]-

21-Cyclopropyl-7α-[(S)-1-hydroxy-1,2,2-trimethylpropyl]-6,14-endo-ethano-6,7,8,14-tetrahydrooripavine hydrochloride [53152-21-9].

» Buprenorphine Hydrochloride contains not less than 98.5 percent and not more than 101.0 percent of C<sub>29</sub>H<sub>41</sub>NO<sub>4</sub> · HCl, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Buprenorphine Hydrochloride RS

USP Buprenorphine Related Compound A RS

21-[3-(1-Propenyl)]-7α-[(S)-1-hydroxy-1,2,2-trimethylpropyl]-6,14-endo-ethano-6,7,8,14-tetrahydrooripavine. C<sub>29</sub>H<sub>41</sub>NO<sub>4</sub> 467.65

**Identification—**

**A:** *Infrared Absorption* (197K).

**B:** To 0.5 mL of a solution of buprenorphine hydrochloride in methanol containing 50 mg per mL add 0.2 mL of a freshly prepared solution (1 in 10) of potassium ferricyanide TS and 0.5 mL of ferric chloride TS: a blue color appears immediately.

**C:** A solution (1 in 100) meets the requirements of the tests for *Chloride* (191).

**Specific rotation** (781S): between −92° and −98°.

*Test solution:* 20 mg per mL, in methanol.

**pH** (791): between 4.0 and 6.0 in a solution containing 10 mg per mL.

**Water, Method I** (921): not more than 1.0%.

**Residue on ignition** (281): not more than 0.1%.

**Chromatographic purity—**

*Mobile phase*—Prepare a filtered and degassed mixture of methanol, 1% solution of ammonium acetate, and glacial acetic acid (60:10:0.01). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Dissolve accurately weighed quantities of USP Buprenorphine Hydrochloride RS and USP Buprenorphine Related Compound A RS in *Mobile phase* to obtain a solution having a known concentration of 12.5 µg of each Reference Standard per mL.

*Test solution*—Dissolve an accurately weighed quantity of about 50 mg of Buprenorphine Hydrochloride in 10.0 mL of *Mobile phase* to obtain a solution having a concentration of about 5 mg per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 288-nm detector and a 4.6-mm × 25-cm column containing packing L1. The

flow rate is about 1 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between buprenorphine hydrochloride and buprenorphine related compound A is not less than 3.0; the column efficiency is not less than 6500 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, and allow the *Test solution* to elute for not less than two times the retention time of buprenorphine hydrochloride. Record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Buprenorphine Hydrochloride taken by the formula:

$$100(r_i / r_s)(C_s / C_T)$$

in which  $r_i$  is the peak response for each impurity obtained from the *Test solution*;  $r_s$  is the peak response of buprenorphine hydrochloride obtained from the *Standard solution*;  $C_s$  is the concentration, in mg per mL, of USP Buprenorphine Hydrochloride RS in the *Standard solution*; and  $C_T$  is the concentration, in mg per mL, of Buprenorphine Hydrochloride in the *Test solution*: not more than 0.25% of any individual impurity is found, and the sum of all impurities is not more than 0.65%.

**Assay**—Dissolve about 0.8 g of Buprenorphine Hydrochloride, accurately weighed, in 50 mL of glacial acetic acid, add 10 mL of mercuric acetate TS and 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 50.41 mg of  $C_{29}H_{41}NO_4 \cdot HCl$ .

## Bupropion Hydrochloride

$C_{13}H_{18}ClNO \cdot HCl$  276.20  
1-Propanone, 1-(3-chlorophenyl)-2-[(1,1-dimethylethyl)amino]-, hydrochloride, ( $\pm$ );  
( $\pm$ )-2-(*tert*-Butylamino)-3'-chloropropiophenone hydrochloride [31677-93-7].

### DEFINITION

Bupropion Hydrochloride contains NLT 98.0% and NMT 102.0% of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ), calculated on the anhydrous basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** <197K>
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- C. IDENTIFICATION TESTS—GENERAL, Chloride** <191>  
**Sample solution:** 1 mg/mL of Bupropion Hydrochloride  
**Acceptance criteria:** Meets the requirements for the silver nitrate precipitate test

## Bupropion Hydrochloride Tablets

### DEFINITION

Bupropion Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

**Sample:** Crush 1 Tablet using a mortar and pestle. Prepare an approximate 1% (w/w) dispersion of the sample in potassium bromide.

**Acceptance criteria:** The *Sample* shows strong bands at about 1690, 1560, and 1240  $cm^{-1}$  and a weaker band at about 740  $cm^{-1}$ , similar to the reference preparation.

#### • B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Buffer:** 6.8 g/L of monobasic potassium phosphate and 1.164 g/L of sodium hydroxide in water

**Mobile phase:** Methanol and *Buffer* (65:35)

**Diluent:** Methanol and water (65:35)

**Standard solution:** 0.6 mg/mL of USP Bupropion Hydrochloride RS in *Diluent*

**Sample stock solution:** Nominally 3.0 mg/mL of bupropion hydrochloride in *Diluent* prepared as follows.

Transfer an appropriate number of Tablets to a suitable volumetric flask. Add 50% of the flask volume of *Diluent*, and shake by mechanical means until the Tablets have disintegrated (30–60 min). Sonicate for 5 min, dilute with *Diluent* to volume, and mix. Allow to stand for at least 30 min. Use the supernatant.

**Sample solution:** Nominally 0.6 mg/mL of bupropion hydrochloride from the *Sample stock solution* in *Diluent*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 224 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m base-deactivated packing L1

**Flow rate:** 1.2 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

Calculate the percentage of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Bupropion Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of bupropion hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION (711)

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Standard solution:** USP Bupropion Hydrochloride RS at a known concentration in 0.1 N hydrochloric acid

**Sample solution:** Pass a portion of the solution under test through a suitable filter, and dilute with 0.1 N hydrochloric acid, if necessary.

#### Instrumental conditions

**Mode:** UV

**Analytical wavelength:** 252 nm

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

**Tolerances:** NLT 80% (Q) of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) is dissolved.

#### • UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

### ADDITIONAL REQUIREMENTS

#### • PACKAGING AND STORAGE:

Preserve in tight containers.

#### • USP REFERENCE STANDARDS (11)

USP Bupropion Hydrochloride RS

## Bupropion Hydrochloride Extended-Release Tablets

### DEFINITION

Bupropion Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

**Sample:** Crush 1 Tablet using a mortar and pestle. Prepare an approximate 1% (w/w) dispersion of the sample in potassium bromide.

**Acceptance criteria:** The *Sample* shows strong bands at about 1690, 1560, and 1240  $cm^{-1}$  and a weaker band at about 740  $cm^{-1}$ , similar to the reference preparation.

#### • B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Diluent 1:** Methanol and 0.001 N hydrochloric acid (20:80)

**Solution A:** Acetonitrile, trifluoroacetic acid, and water (10:0.04:90)

**Solution B:** Acetonitrile, trifluoroacetic acid, and water (95:0.03:5)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	90	10
3.4	87	13
10.0	15	85
10.1	0	100
13.0	0	100
13.2	90	10
19.0	90	10

**System suitability stock solution A:** 0.02 mg/mL of USP Bupropion Hydrochloride Related Compound C RS and 0.2 mg/mL of USP Bupropion Hydrochloride Related Compound F RS in methanol

**System suitability solution A:** 0.0018 mg/mL of USP Bupropion Hydrochloride Related Compound C RS and 0.018 mg/mL of USP Bupropion Hydrochloride Related Compound F RS from *System suitability stock solution A* and *Diluent 1*

**System suitability stock solution B:** 0.09 mg/mL of *m*-chlorobenzoic acid in water

**System suitability solution B:** 0.0018 mg/mL of *m*-chlorobenzoic acid from *System suitability stock solution B* and *Diluent 1*

**Standard solution:** 0.6 mg/mL of USP Bupropion Hydrochloride RS in *Diluent 1*

**Sample stock solution A:** Transfer a number of Tablets intact or crushed, to a suitable homogenizer vessel containing sufficient methanol to obtain a concentration of 3.0 mg/mL of bupropion hydrochloride. Immediately homogenize the sample for 30 s at 20,000 rpm. Allow extraction for 3 min, and follow by two additional 10-s pulses, each at 20,000 rpm, pausing 3 min between these pulses to ensure complete extraction. Pass a portion of the solution through a nylon filter of 0.45-μm pore size, discarding the first 2–4 mL of the filtrate.

**Sample solution A:** Nominally 0.6 mg/mL of *Sample stock solution A* in 0.001 N hydrochloric acid. Alternatively, the *Sample solution* can be prepared as follows:

**Buffer:** Dissolve 100 g of anhydrous disodium hydrogen phosphate in 1 L of water. Add 50 mL of phosphoric acid, stir or sonicate until dissolved, and mix. Adjust with phosphoric acid to a pH of 3.0.

**Diluent 2:** Methanol and *Buffer* (1:4)

**Sample stock solution B:** Weigh and grind NLT 20 Tablets to prepare a solution of nominal concentration of 3 mg/mL. Initially add *Diluent 2* (75% of the volume of the flask), stir for 30 min, and sonicate for 15 min, and then dilute to volume. Mix, centrifuge a portion, and use the supernatant.

**Sample solution B:** Nominally 0.6 mg/mL of *Sample stock solution B* in *Diluent 2*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 226 nm

**Column:** 4.6-mm × 10-cm; 3.5-μm packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 5 μL

#### System suitability

**Samples:** *System suitability solution A*, *System suitability solution B*, and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.5 between bupropion hydrochloride related compound C and bupropion hydrochloride related compound F, *System suitability solution A*

**Tailing factor:** NMT 1.9, *Standard solution*

**Relative standard deviation:** NMT 1.5%, *Standard solution*

**Relative response factor:** Between 0.22 and 0.26 for *m*-chlorobenzoic acid. [NOTE—Use the responses from *System suitability solution B* and the *Standard solution*.]

#### Analysis

**Samples:** *Standard solution* and *Sample solution A* or *Sample solution B*

Calculate the percentage of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of bupropion hydrochloride from *Sample solution A* or *Sample solution B*

$r_S$  = peak response of bupropion hydrochloride from the *Standard solution*

$C_S$  = concentration of USP Bupropion Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of bupropion hydrochloride in *Sample solution A* or *Sample solution B* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

For products labeled for dosing every 12 h

##### Test 1

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Times:** 1, 4, and 8 h

**Standard solution:** USP Bupropion Hydrochloride RS at a known concentration in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter, and dilute with *Medium*, if necessary.

##### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV-Vis

**Analytical wavelength:** 298 nm

**Cell:** 1.0 cm

**Blank:** *Medium*

##### Analysis

**Samples:** *Standard solution* and *Sample solution*

**Tolerances:** See *Table 2*.

**Table 2**

Time (h)	Amount Dissolved (%)
1	25–45
4	60–85
8	NLT 80

The percentages of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 0.1 N hydrochloric acid, pH 1.5 (prepared by transferring 50 mL of concentrated hydrochloric acid to 6000 mL of water, adding 18 g of sodium hydroxide, mixing, and adjusting with either diluted sodium hydroxide or hydrochloric acid to a pH of  $1.5 \pm 0.05$ ); 900 mL, deaerated

**Apparatus 1:** 50 rpm

**Times:** 1, 2, 4, and 6 h

Determine the percentages of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) dissolved by using the following method.

**Buffer:** 3.45 g of monobasic sodium phosphate monohydrate in 996 mL of water. Add 4.0 mL of triethylamine, and adjust with phosphoric acid to a pH of  $2.80 \pm 0.05$ .

**Mobile phase:** Methanol and *Buffer* (7:13)

**Standard solution:** USP Bupropion Hydrochloride RS in *Medium* at a known concentration similar to the one expected in the *Sample solution*

**Sample solution:** Use portions of the solution under test, and pass through a nylon filter of 0.45-μm pore size.

##### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 298 nm

**Column:** 4.6-mm × 15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 2000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Tolerances:** See Table 3.

**Table 3**

Time (h)	Amount Dissolved (%)
1	25–50
2	40–65
4	65–90
6	NLT 80

The percentages of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 3:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Medium, Apparatus 2, Standard solution, Sample solution, Instrumental conditions, and Analysis:** Proceed as directed for *Test 1*, except the wavelength is about 250 nm, and use wire coil sinkers, if necessary.

**Times:** 1, 2, 4, and 6 h

**Tolerances:** See Table 4.

**Table 4**

Time (h)	Amount Dissolved (%)
1	30–55
2	50–75
4	70–90
6	NLT 80

The percentages of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 5:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

**Medium and Analysis:** Proceed as directed for *Test 1*.

**Times:** 1, 3, and 6 h

**Instrumental conditions:** Proceed as directed for *Test 1*, except use a 0.5-cm cell.

**Tolerances:** See Table 5.

**Table 5**

Time (h)	Amount Dissolved (%)
1	35–55
3	65–85
6	NLT 80

The percentages of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 7:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 7*.

**Medium, Apparatus 1, and Times:** Proceed as directed for *Test 2*, including the quantitative chromat-

ographic method, but using as the *Mobile phase* a mixture of *Buffer* with methanol (55:45).

**Tolerances:** See Table 6.

**Table 6**

Time (h)	Amount Dissolved (%)
1	25–50
2	45–70
4	NLT 70
6	NLT 80

The percentages of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**Test 9:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 9*.

**Medium:** 0.1 N hydrochloric acid, pH 1.5 (prepared as directed for *Test 2*); 900 mL

**Apparatus 1:** 50 rpm

**Times:** 1, 2, 4, and 8 h

**Standard solution:** ( $L/1000$ ) mg/mL of USP Bupropion Hydrochloride RS in *Medium*, where  $L$  is the Tablet label claim, in mg

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

**Instrumental conditions:** Proceed as directed for *Test 1*.

**Tolerances:** See Table 7.

**Table 7**

Time (h)	Amount Dissolved (%)
1	20–45
2	35–55
4	55–85
8	NLT 80

The percentages of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in <711>.

**For products labeled for dosing every 24 h**

**Test 4:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

**Medium:** 0.1 N hydrochloric acid; 900 mL, deaerated

**Apparatus 1:** 75 rpm

**Times:** 2, 4, 8, and 16 h

**Standard solution:** USP Bupropion Hydrochloride RS at a known concentration in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter, and dilute with *Medium*, if necessary.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV-Vis

**Analytical wavelength:** 252 nm

**Cell:** 1.0 cm

**Blank:** *Medium*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Tolerances:** See Table 8.

**Table 8**

Time (h)	Amount Dissolved (%)
2	NMT 20
4	20–45
8	65–90
16	NLT 80

The percentages of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in (711).

**Test 6:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.

**Medium and Apparatus 1:** Proceed as directed for *Test 4*.

**Times:** 1, 2, 4, 8, and 12 h

**Standard solution:** USP Bupropion Hydrochloride RS at a known concentration in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter, and dilute with *Medium*, if necessary.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV-Vis

**Analytical wavelength:** 298 nm

**Cell:** 1.0 cm

**Blank:** *Medium*

**Tolerances:** See *Table 9*.

Table 9

Time (h)	Amount Dissolved (%)
1	15–35
2	25–50
4	40–65
8	65–90
12	NLT 80

The percentages of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in (711).

**Test 8:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 8*.

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 1:** 75 rpm

**Times:** 2, 4, 8, and 16 h

**Standard solution**

**For Tablets labeled to contain 150 mg:** USP Bupropion Hydrochloride RS dissolved in *Medium* (about 0.167 mg/mL)

**For Tablets labeled to contain 300 mg:** USP Bupropion Hydrochloride RS dissolved in *Medium* (about 0.333 mg/mL)

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV-Vis

**Analytical wavelength:** 298 nm

**Blank:** *Medium*

**Tolerances:** See *Table 10*.

Table 10

Time (h)	Amount Dissolved (%)
2	NMT 10
4	10–35
8	45–75
16	NLT 80

The percentages of the labeled amount of bupropion hydrochloride ( $C_{13}H_{18}ClNO \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in (711).

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### Procedure for content uniformity

**Standard solution:** 0.33 mg/mL of USP Bupropion Hydrochloride RS in water

**Sample solution:** Transfer 1 Tablet to a suitable homogenizer vessel containing a volume of water to obtain a concentration of about 0.33 mg of bupropion hydrochloride per mL. Immediately homogenize the sample using single 30-s pulses each at 5000, 10,000, and 15,000 rpm, and follow by two pulses each at 20,000 rpm. After the homogenate has settled, mix at 5000 rpm for an additional 30 s. Pass a portion of the solution through a nylon filter of 0.45- $\mu$ m pore size, discarding the first 4 mL of the filtrate.

**Analysis:** Proceed as directed for the appropriate *Dissolution* procedure, using a 0.5-cm cell, and correct for dilution.

#### IMPURITIES

##### • ORGANIC IMPURITIES

**Solution A, Solution B, Mobile phase, System suitability solution A, System suitability solution B, Standard solution, Sample solution A or Sample solution B, and Chromatographic system:** Proceed as directed in the *Assay*.

##### Analysis

**Samples:** *Standard solution* and *Sample solution A* or *Sample solution B*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

$r_U$  = peak response of each impurity from *Sample solution A* or *Sample solution B*

$r_S$  = peak response of bupropion hydrochloride from the *Standard solution*

$C_S$  = concentration of USP Bupropion Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of bupropion hydrochloride in *Sample solution A* or *Sample solution B* (mg/mL)

$F$  = relative response factor for each impurity (see *Table 11* for values)

**Acceptance criteria:** See *Table 11*.

Table 11

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)	
			100 mg or less	150 mg or greater
2-Amino-1-(3-chlorophenyl)-1-propanone	0.38	0.80	0.3	0.3
(3 <i>S</i> ,5 <i>S</i> ,6 <i>S</i> )-6-(3-Chlorophenyl)-6-hydroxy-5-methyl-3-thiomorpholine carboxylic acid	0.56	0.86	1.0	1.5
(3 <i>S</i> ,5 <i>R</i> ,6 <i>R</i> )-6-(3-Chlorophenyl)-6-hydroxy-5-methyl-3-thiomorpholine carboxylic acid	0.78	0.88	0.5	0.4

Table 11 (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)	
			100 mg or less	150 mg or greater
Bupropion	1.0	—	—	—
Bupropion related compound F	1.71	0.55	1.2	2.3
Bupropion related compound C	1.75	0.59	0.3	0.3
<i>m</i> -Chloro-benzoic acid	1.80	0.24	0.3	0.3
1-(3-Chlorophenyl)-1,2-propanedione	2.25	1.00	0.4	0.4
Any unspecified impurity	—	1.00	0.2	0.2
Total impurities	—	—	3.2	3.3

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)
  - USP Bupropion Hydrochloride RS
  - USP Bupropion Hydrochloride Related Compound C RS
  - 1-(3-Chlorophenyl)-2-hydroxy-1-propanone.  
C<sub>9</sub>H<sub>9</sub>O<sub>2</sub>Cl 184.62
  - USP Bupropion Hydrochloride Related Compound F RS
  - 1-(3-Chlorophenyl)-1-hydroxy-2-propanone.  
C<sub>9</sub>H<sub>9</sub>O<sub>2</sub>Cl 184.62

**Buspirone Hydrochloride**

C<sub>21</sub>H<sub>31</sub>N<sub>5</sub>O<sub>2</sub> · HCl 421.96  
 8-Azaspiro[4,5]decane-7,9-dione, 8-[4-[4-(2-pyrimidinyl)-1-piperazinyl]butyl]-, monohydrochloride;  
*N*-[4-[4-(2-Pyrimidinyl)-1-piperazinyl]butyl]-1,1-cyclopentanediacetamide monohydrochloride  
 [33386-08-2; 36505-84-7].

**DEFINITION**

Buspirone Hydrochloride contains NLT 97.5% and NMT 102.5% of C<sub>21</sub>H<sub>31</sub>N<sub>5</sub>O<sub>2</sub> · HCl, calculated on the as-is basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)
- **B.** The relative retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements

**Sample solution:** 10 mg/mL in water

**ASSAY****PROCEDURE**

**Buffer:** 1.36 g/L of monobasic potassium phosphate in water. Adjust the solution with 10% sodium hydroxide (w/v) to a pH of 7.5, and filter.

**Mobile phase:** Acetonitrile and *Buffer* (2:3)

**Internal standard stock solution:** 2.5 mg/mL of propylparaben in methanol

**Internal standard solution:** 0.125 mg/mL of propylparaben from the *Internal standard stock solution* in water

**Standard stock solution:** Dissolve 50 mg of USP Buspirone Hydrochloride RS in 25 mL of 1 N hydrochloric acid in a 100-mL volumetric flask, and dilute with water to volume.

**Standard solution:** To 10.0 mL of *Standard stock solution* in a 50.0-mL volumetric flask add 10.0 mL of *Internal standard solution*, and dilute with water to volume.

**Sample stock solution:** Dissolve 50 mg of Buspirone Hydrochloride in 25 mL of 1 N hydrochloric acid in a 100-mL volumetric flask, and dilute with water to volume.

**Sample solution:** 0.1 mg/mL of Buspirone Hydrochloride from the *Sample stock solution* and 0.025 mg/mL of propylparaben from the *Internal standard solution* in water

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection size:** 25 µL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for propylparaben and buspirone hydrochloride are about 0.55 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 4 between buspirone hydrochloride and the internal standard

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>21</sub>H<sub>31</sub>N<sub>5</sub>O<sub>2</sub> · HCl in the portion of Buspirone Hydrochloride taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of buspirone hydrochloride to propylparaben from the *Sample solution*

$R_S$  = peak response ratio of buspirone hydrochloride to propylparaben from the *Standard solution*

$C_S$  = concentration of USP Buspirone Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Buspirone Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.5%–102.5% on the as-is basis

**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.5%
- **HEAVY METALS, Method II** (231): NMT 20 ppm

**SPECIFIC TESTS**

- **WATER DETERMINATION, Method I** (921): NMT 0.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, at controlled room temperature.

- **USP REFERENCE STANDARDS** (11)  
USP Buspirone Hydrochloride RS

## Buspirone Hydrochloride Tablets

» Buspirone Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of buspirone hydrochloride ( $C_{21}H_{31}N_5O_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, at controlled room temperature.

**USP Reference standards** (11)—  
USP Buspirone Hydrochloride RS

### Identification—

**A:** *Infrared Absorption* (197K)—

*Test specimen*—Grind 20 Tablets to a fine powder, add 50 mL of chloroform, stir for 3 to 5 minutes, and filter into a 250-mL evaporating flask. Evaporate the solution with the aid of a rotary evaporator to dryness at low heat. Use the residue.

**B:** The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

*Medium:* 0.01 N hydrochloric acid; 500 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

*Procedure*—Determine the amount of  $C_{21}H_{31}N_5O_2 \cdot HCl$  dissolved by employing UV absorption at the wavelength of maximum absorbances at about 235 nm on filtered portions of the solution under test, suitably diluted with 0.01 N hydrochloric acid, in comparison with a Standard solution having a known concentration of USP Buspirone Hydrochloride RS in the same *Medium*.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_{21}H_{31}N_5O_2 \cdot HCl$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

*Buffer solution, Mobile phase, Internal standard solution, Standard stock solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Buspirone Hydrochloride*.

*Assay preparation*—Transfer a number of Tablets, equivalent to about 100 mg of buspirone hydrochloride, to a 200-mL volumetric flask, add 50 mL of 1 N hydrochloric acid, and shake for 15 minutes. Add about 100 mL of water, and shake for 30 minutes. Dilute with water to volume, mix, and filter, discarding the first 20 mL of the filtrate. Pipet 10.0 mL of the filtrate and 10.0 mL of *Internal standard solution* into a 50-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Buspirone Hydrochloride*. Calculate the quantity, in mg, of buspirone hydrochloride ( $C_{21}H_{31}N_5O_2 \cdot HCl$ ) in the Tablets taken by the formula:

$$(L / D)C(R_U / R_S)$$

in which *L* is the labeled amount, in mg, of buspirone hydrochloride in each Tablet; *D* is the concentration, in mg per mL, of buspirone hydrochloride in the *Assay preparation*, based on the labeled quantity per Tablet and the extent of dilution; *C* is the concentration, in mg per mL, of USP Buspirone Hydrochloride RS in the *Standard preparation*; and *R<sub>U</sub>*

and *R<sub>S</sub>* are the peak response ratios of buspirone hydrochloride to propylparaben obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Busulfan

$C_6H_{14}O_6S_2$  246.30

1,4-Butanediol, dimethanesulfonate.

1,4-Butanediol dimethanesulfonate [55-98-1].

» Busulfan contains not less than 98.0 percent and not more than 100.5 percent of  $C_6H_{14}O_6S_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The label bears a warning that great care should be taken to prevent inhaling particles of Busulfan and exposing the skin to it.

### Identification—

**A:** Fuse about 100 mg with about 100 mg of potassium nitrate and a pellet of potassium hydroxide weighing approximately 250 mg. Cool, dissolve the residue in water, acidify with 3 N hydrochloric acid, and add a few drops of barium chloride TS: a white precipitate is formed.

**B:** To 100 mg add 10 mL of water and 5 mL of 1 N sodium hydroxide. Heat until a clear solution is obtained: an odor characteristic of methanesulfonic acid is perceptible.

**C:** Cool the solution obtained in *Identification* test *B*, and divide it into two equal portions. To one portion add 1 drop of potassium permanganate TS: the purple color changes to violet, then to blue, and finally to emerald-green. Acidify the second portion of the solution with 2 N sulfuric acid, and add 1 drop of potassium permanganate TS: the color of the permanganate is not discharged.

**Melting range** (741): between 115° and 118°.

**Loss on drying** (731)—Dry it in vacuum at 60° to constant weight: it loses not more than 2.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Assay**—Transfer about 80 mg of Busulfan, accurately weighed, to a 250-mL conical flask. Add about 30 mL of water, swirl, add phenolphthalein TS, and neutralize with 0.05 N sodium hydroxide. Connect the flask to a reflux air condenser, and boil the mixture gently for not less than 30 minutes, adding water occasionally to maintain the volume. Cool to room temperature, add phenolphthalein TS, and titrate with 0.05 N sodium hydroxide VS. Each mL of 0.05 N sodium hydroxide is equivalent to 6.158 mg of  $C_6H_{14}O_6S_2$ .

## Busulfan Tablets

» Busulfan Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_6H_{14}O_6S_2$ .

**Packaging and storage**—Preserve in well-closed containers.

**Identification**—Pulverize a suitable number of Tablets, and extract the powder with several portions of acetone. Evaporate the combined acetone extracts, with the aid of a cur-

rent of air, on a steam bath: the dry residue responds to the *Identification* tests under *Busulfan*, and melts at about 115°.

**Disintegration** (701): 30 minutes, the use of disks being omitted.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—Weigh and finely powder not fewer than 40 Tablets. [Caution—Guard against accidental inhalation of fine powder.] Weigh accurately a portion of the powder, equivalent to about 80 mg of busulfan, and transfer to a 100-mL beaker. Extract with four 20-mL portions of acetone, each time stirring the mixture well, then allowing the insoluble matter to settle, and finally decanting the supernatant through a sintered-glass filter into a 250-mL conical flask. Evaporate the combined acetone extracts to about 10 mL, add phenolphthalein TS, and neutralize with 0.05 N sodium hydroxide. Evaporate to dryness, add about 30 mL of water, and proceed as directed in the *Assay* under *Busulfan*, beginning with "Connect the flask." Each mL of 0.05 N sodium hydroxide is equivalent to 6.158 mg of  $C_6H_{14}O_6S_2$ .

## Butabarbital

$C_{10}H_{16}N_2O_3$  212.25  
2,4,6-(1*H*,3*H*,5*H*)-Pyrimidinetrione, 5-ethyl-  
5-(1-methylpropyl)-.  
5-sec-Butyl-5-ethylbarbituric acid [125-40-6].

» Butabarbital contains not less than 98.5 percent and not more than 101.0 percent of  $C_{10}H_{16}N_2O_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Butabarbital RS

**Identification**, *Infrared Absorption* (197M).

**Melting range**, *Class Ia* (741): between 164° and 167°.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Chromatographic purity**—

**Standard solutions**—Dissolve a quantity of USP Butabarbital RS in a mixture of chloroform and methanol (1:1) to obtain a solution having a concentration of 4.0 mg per mL (*Standard solution A*). Dilute 1.0 mL of *Standard solution A* with a mixture of chloroform and methanol (1:1) to 10.0 mL, and mix (*Standard solution B*).

**Test solution**—Dissolve a quantity of Butabarbital in a mixture of chloroform and methanol (1:1) to obtain a solution having a concentration of 40 mg per mL.

**Procedure**—Proceed as directed for *Procedure* in the test for *Chromatographic purity* under *Butabarbital Sodium*.

**Assay**—

**Internal standard solution**—Transfer about 400 mg of tetracosane to a 200-mL volumetric flask, add chloroform to volume, and mix.

**Standard preparation**—Transfer about 200 mg of USP Butabarbital RS, accurately weighed, to a 100-mL volumetric flask, add chloroform to volume, and mix. Transfer 10.0 mL of the resulting solution to a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, and mix to obtain a

solution having a known concentration of about 1.0 mg of USP Butabarbital RS per mL.

**Assay preparation**—Transfer about 200 mg of Butabarbital, accurately weighed, to a 100-mL volumetric flask, add chloroform to volume, and mix. Transfer 10.0 mL of the resulting solution to a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, and mix.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm × 1.8-m column packed with 10% phase G37 on support S1AB. The column temperature is maintained at about 260°, the injection port at about 260°, and the detector block at about 300°. Dry nitrogen is used as the carrier gas at a flow rate of about 50 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factors for the analyte and internal standard peaks are not more than 1.3 and 1.2, respectively; the resolution, *R*, between the analyte and internal standard peaks is not less than 3.0; and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 2 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for butabarbital and 1.0 for tetracosane. Calculate the quantity, in mg, of  $C_{10}H_{16}N_2O_3$  in the portion of Butabarbital taken by the formula:

$$200C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Butabarbital RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Butabarbital Sodium

$C_{10}H_{15}N_2NaO_3$  234.23  
2,4,6-(1*H*,3*H*,5*H*)-Pyrimidinetrione, 5-ethyl-  
5-(1-methylpropyl)-, monosodium salt.  
Sodium 5-sec-butyl-5-ethylbarbiturate [143-81-7].

» Butabarbital Sodium contains not less than 98.2 percent and not more than 100.5 percent of  $C_{10}H_{15}N_2NaO_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Butabarbital RS

**Completeness of solution**—Dissolve 1.0 g in 10 mL of carbon dioxide-free water: after 1 minute, the solution is clear and free from undissolved solid.

**Identification**—

**A: Infrared Absorption** (197K)—Prepare the test specimen as follows. Transfer about 150 mg to a suitable separator, dissolve in 10 mL of water, and add 15 mL of 3 N hydrochloric acid. Extract with three 20-mL portions of chloroform, filter the extracts through anhydrous sodium sulfate, and collect the extracts in a suitable beaker. Evaporate the combined chloroform extracts on a steam bath with the aid of a current of air to dryness, and dry the residue at 105° for 2 hours.

**B: Ultraviolet Absorption** (197U)—

**Solution:** 10 µg per mL.

**Medium:** pH 9.6 alkaline borate buffer (see under *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*).

Absorptivities at 240 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** Ignite about 100 mg; the residue responds to the tests for *Sodium* (191).

**pH** (791): between 10.0 and 11.2, in the solution prepared for the test for *Completeness of solution*.

**Loss on drying** (731)—Dry it at 150° to constant weight; it loses not more than 5.0% of its weight.

**Heavy metals, Method II** (231): 0.003%.

#### Chromatographic purity—

**Standard solutions**—Dissolve a quantity of USP Butabarbital RS in a mixture of chloroform and methanol (1:1) to obtain a solution having a final concentration of 4.0 mg per mL (*Standard solution A*). Dilute 1.0 mL of *Standard solution A* with a mixture of chloroform and methanol (1:1) to 10.0 mL, and mix (*Standard solution B*).

**Test solution**—Dissolve a quantity of Butabarbital Sodium in a mixture of chloroform and methanol (1:1) to obtain a solution having a final concentration of 44 mg per mL.

**Procedure**—Apply 10 µL of the *Test solution* and 10 µL each of *Standard solution A* and *Standard solution B* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of acetone, methylene chloride, methanol, and ammonium hydroxide (5:3:1:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and dry the plate in a current of air. Spray the plate with a solution of mercurous nitrate dihydrate in 0.15 N nitric acid (1 in 100), and immediately estimate the intensities of any spots in the chromatogram of the *Test solution*, other than the principal spot, in comparison with *Standard solution B*: the  $R_f$  value of the principal spot obtained from the *Test solution* corresponds to that obtained from *Standard solution A*; and the sum of the intensities of any secondary spots observed in the chromatogram of the *Test solution* is not greater than the intensity of the principal spot produced by *Standard solution B*, corresponding to not more than a total of 1% of impurities.

#### Assay—

**Standard preparation**—Transfer about 25 mg of USP Butabarbital RS, accurately weighed, to a 200-mL volumetric flask, dissolve in pH 9.6 alkaline borate buffer (see under *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), and dilute with the same solvent to volume.

**Assay preparation**—Transfer about 28 mg of Butabarbital Sodium, accurately weighed, to a 200-mL volumetric flask, dissolve in pH 9.6 alkaline borate buffer to volume, and dilute with the same solvent to volume.

**Procedure**—Transfer 10.0 mL each of the *Standard preparation* and the *Assay preparation* to separate 100-mL volumetric flasks, dilute each with pH 9.6 alkaline borate buffer to volume, and mix. Concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 240 nm, with a suitable spectrophotometer, using pH 9.6 alkaline borate buffer as the blank. Calculate the quantity, in mg, of  $C_{10}H_{15}N_2NaO_3$  in the portion of Butabarbital Sodium taken by the formula:

$$(234.23 / 212.25)(0.2C)(A_U / A_S)$$

in which 234.23 and 212.25 are the molecular weights of butabarbital sodium and butabarbital, respectively; C is the concentration, in µg per mL, of USP Butabarbital RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Butabarbital Sodium Oral Solution

» Butabarbital Sodium Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of butabarbital sodium ( $C_{10}H_{15}N_2NaO_3$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Butabarbital RS

**Identification, Infrared Absorption** (197K)—Prepare the test specimen as follows. Place a volume of Oral Solution, equivalent to about 150 mg of butabarbital sodium, in a separator, render it distinctly alkaline by the addition of 1 N sodium hydroxide, and saturate it with sodium chloride. Extract the mixture with two 15-mL portions of ether, and discard the ether. Acidify the solution with hydrochloric acid, and render it just alkaline to litmus by adding small portions of sodium bicarbonate (carbonate-free). Extract the liberated acid barbiturate, using five 20-mL portions of chloroform. Wash the combined chloroform extracts with 10 mL of water acidified with 1 drop of hydrochloric acid, then extract the water with 10 mL of chloroform, adding the latter to the main chloroform solution. Filter the chloroform solution through a pledget of cotton or other suitable filter, previously washed with chloroform, into a tared beaker, and finally wash the separator and the filter with three 5-mL portions of chloroform. Evaporate the combined chloroform solution and washings on a steam bath with the aid of a current of air to dryness, and dry the residue at 105° for 2 hours.

**Alcohol content, Method II** (611): between 95.0% and 115.0% of the labeled amount of  $C_2H_5OH$ .

#### Assay—

**Internal standard solution**—Dissolve an accurately weighed quantity of secobarbital in chloroform, and quantitatively dilute with chloroform to obtain a solution having a known concentration of about 0.7 mg per mL.

**Standard preparation**—Dissolve accurately weighed quantities of USP Butabarbital RS and secobarbital in chloroform, and quantitatively dilute with chloroform to obtain a solution that contains, in each mL, known amounts of about 1 mg of USP Butabarbital RS and about 1.4 mg of secobarbital.

**Assay preparation**—[NOTE—This preparation includes a bromination step for elimination of parabens and a carbonate-chloroform extraction for elimination of benzoic acid.] Transfer an accurately measured volume of Oral Solution, equivalent to about 30 mg of butabarbital sodium, to a separator, add 1 mL of bromine water (prepared by dissolving 2.0 mL of bromine and 10 g of potassium bromide in 60 mL of water), and swirl. Allow to stand for 5 minutes, add 1 mL of sodium metabisulfite solution (1 in 10), and swirl. Add 300 mg of sodium bicarbonate in small portions, with mixing, and extract with four 10-mL portions of chloroform. Filter the extracts through about 15 g of anhydrous sodium sulfate that is supported on a funnel by a small pledget of glass wool. Collect the combined filtrates in a 50-mL volumetric flask, wash the sodium sulfate with 5 mL of chloroform, collecting the washing with the filtrate, dilute with chloroform to volume, and mix. Combine 2.0 mL of this solution with 2.0 mL of *Internal standard solution* in a suitable container, and reduce the volume to about 1 mL by evaporation, with the aid of a stream of dry nitrogen, at room temperature.

**Chromatographic system and System suitability**—Proceed as directed for *Chromatographic System* and *System Suitability* under *Barbiturate Assay* (361), the resolution,  $R$ , between butabarbital and secobarbital being not less than 2.4.

[NOTE—Relative retention times are approximately 0.6 for butabarbital and 1.0 for secobarbital.]

**Procedure**—Proceed as directed for *Procedure* under *Barbiturate Assay* (361). Calculate the quantity, in mg, of butabarbital sodium ( $C_{10}H_{15}N_2NaO_3$ ) in each mL of the Oral Solution taken by the formula:

$$(234.23 / 212.25)(50)(R_U)(Q_S)(C_i) / V(R_S)$$

in which 234.23 and 212.25 are the molecular weights of butabarbital sodium and butabarbital, respectively;  $V$  is the volume, in mL, of Oral Solution taken; and the other terms are as defined therein.

## Butabarbital Sodium Tablets

» Butabarbital Sodium Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of butabarbital sodium ( $C_{10}H_{15}N_2NaO_3$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Butabarbital RS

**Identification, Infrared Absorption** (197K)—

**Test specimen**—Mix a quantity of ground Tablets, equivalent to about 150 mg of butabarbital sodium, with 1 mL of dimethyl sulfoxide and 1 mL of water, add hydrochloric acid dropwise until the solution is just acid to litmus, and mix. Add 3 g of chromatographic siliceous earth, and mix. Proceed as directed for *Column Partition Chromatography* under *Chromatography* (621), packing the chromatographic tube as follows. The lower layer consists of 4 g of chromatographic siliceous earth mixed with 3 mL of sodium carbonate solution (1 in 10), and the upper layer is the test specimen. Wash the column with 75 mL of a water-saturated mixture of isooctane and ether (4:1), and discard the washing. Elute the butabarbital with 200 mL of water-saturated ether, collecting the eluate in a suitable vessel. Evaporate the eluate to dryness on a steam bath under a current of air, and dry the residue at 105° for 2 hours.

**Dissolution** (711)—

**Medium:** water; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of  $C_{10}H_{15}N_2NaO_3$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 239 nm on filtered portions of the solution under test, mixed with sufficient ammonium hydroxide to provide a concentration of 0.5 N ammonium hydroxide, and suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Butabarbital RS in the same medium.

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amount of  $C_{10}H_{15}N_2NaO_3$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

**Acid-methanol mixture**—Prepare a mixture of methanol and 1 N hydrochloric acid (9:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Butabarbital RS in *Acid-methanol mixture* to obtain a solution having a known concentration of about 0.45 mg per mL.

**Test preparation**—Transfer 1 finely powdered Tablet to a 25-mL volumetric flask, add *Acid-methanol mixture* to volume, and mix. Filter, discarding the first 5 mL of the filtrate, and dilute the subsequent filtrate, quantitatively and stepwise if necessary, with *Acid-methanol mixture* to obtain a solution containing 0.5 to 0.6 mg of butabarbital sodium per mL.

**Procedure**—Transfer 2.0 mL each of the *Standard preparation* and the *Test preparation* to separate 100-mL volumetric flasks, and transfer 2.0 mL of *Acid-methanol mixture* to a third volumetric flask to provide a blank. Dilute each flask with pH 9.6 alkaline borate buffer (see under *Solutions* in the section *Reagents, Indicators, and Solutions*), and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 240 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of  $C_{10}H_{15}N_2NaO_3$  in the Tablet taken by the formula:

$$(234.23/212.25)/(TC/D)(A_U / A_S)$$

in which 234.23 and 212.25 are the molecular weights of butabarbital sodium and butabarbital, respectively;  $T$  is the labeled quantity, in mg, of butabarbital sodium in the Tablet;  $C$  is the concentration, in mg per mL, of USP Butabarbital RS in the *Standard preparation*;  $D$  is the concentration, in mg per mL, of butabarbital sodium in the *Test preparation*, based upon the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

**Assay**—

**Internal standard solution**—Dissolve an accurately weighed quantity of secobarbital in chloroform, and dilute quantitatively with chloroform to obtain a solution having a known concentration of about 1.2 mg per mL.

**Standard preparation**—Dissolve accurately weighed quantities of USP Butabarbital RS and secobarbital in chloroform, and dilute quantitatively with chloroform to obtain a solution that contains, in each mL, known amounts of about 0.8 mg of USP Butabarbital RS and about 1 mg of secobarbital.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of butabarbital sodium, to a 50-mL volumetric flask, add 35 mL of dilute ammonium hydroxide (1 in 25), dilute with water to volume, and mix. Filter, if necessary, discarding the first 15 mL of the filtrate, and transfer 25.0 mL of the clear solution to a separator. Add 2 mL of hydrochloric acid, and extract with three 25-mL portions of chloroform. Filter the extracts through about 15 g of anhydrous sodium sulfate that is supported on a funnel by a small pledget of glass wool. Collect the combined filtrate in a 100-mL volumetric flask, wash the sodium sulfate with 15 mL of chloroform, collecting the washing with the filtrate, dilute with chloroform to volume, and mix. Combine 4.0 mL of this solution with 1.0 mL of *Internal standard solution* in a suitable container, and reduce the volume to about 1 mL by evaporation, with the aid of a stream of dry nitrogen, at room temperature.

**Chromatographic system and System suitability**—Proceed as directed for *Chromatographic System* and *System Suitability* under *Barbiturate Assay* (361). The resolution,  $R$ , between butabarbital and secobarbital is not less than 2.4; and the relative retention times are approximately 0.6 for butabarbital and 1.0 for secobarbital.

**Procedure**—Proceed as directed for *Procedure* under *Barbiturate Assay* (361). Calculate the quantity, in mg, of

$C_{10}H_{15}N_2NaO_3$  in the portion of Tablets taken by the formula:

$$(234.23 / 212.25)(50)(R_U)(Q_3)(C_i) / (R_3)$$

in which 234.23 and 212.25 are the molecular weights of butabarbital sodium and butabarbital, respectively; and the other terms are as defined therein.

## Butalbital

$C_{11}H_{16}N_2O_3$  224.26  
2,4,6-(1*H*,3*H*,5*H*)-Pyrimidinetrione, 5-(2-methylpropyl)-  
5-(2-propenyl)-.  
5-Allyl-5-isobutylbarbituric acid [77-26-9].

» Butalbital contains not less than 98.0 percent and not more than 102.0 percent of  $C_{11}H_{16}N_2O_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Butalbital RS

### Identification—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 15 µg per mL.

*Medium:* 0.1 N sodium hydroxide.

Absorptivities at 246 nm, calculated on the dried basis, do not differ by more than 2.5%.

**Melting range** (741): between 138° and 141°.

**Loss on drying** (731)—Dry it in vacuum at room temperature to constant weight: it loses not more than 0.2% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, Method II (231): 0.002%.

### Chromatographic purity—

*Chloroform-methanol*—Mix equal volumes of chloroform and methanol.

*Standard preparations*—Dissolve a quantity of USP Butalbital RS in *Chloroform-methanol* to obtain a solution having a concentration of 40 mg per mL (*Solution A*). Dilute 1.0 mL of *Solution A* with *Chloroform-methanol* to 100 mL, and mix (*Solution B*); mix 5.0 mL of *Solution B* with 5.0 mL of *Chloroform-methanol* (*Solution C*); and mix 5.0 mL of *Solution C* with 5.0 mL of *Chloroform-methanol* (*Solution D*).

*Test preparation*—Dissolve a quantity of Butalbital in *Chloroform-methanol* to obtain a solution having a concentration of 40 mg per mL.

*Procedure*—In a suitable chromatographic chamber, arranged for thin-layer chromatography and lined with filter paper, place a volume of a developing solvent consisting of a mixture of acetone, dichloromethane, methanol, and ammonium hydroxide (50:30:10:10) sufficient to develop the chromatogram. Cover the chamber, and allow it to equilibrate for 30 minutes. Apply 10 µL each of the *Test preparation* and *Solutions A, B, C, and D* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram until the solvent front has

moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry the plate in a current of air. Spray the plate with a reagent prepared by dissolving 5 g of potassium hydroxide in a mixture of 25 mL of water and 75 mL of alcohol. Allow the plate to dry in warm air for 10 minutes, and examine the chromatograms under UV light: the chromatograms show principal spots at about the same  $R_f$  value; and the sum of the intensities of any secondary spots, if present in the chromatogram from the *Test preparation*, is not greater than 1% of that of the principal spot from *Solution A*. [NOTE—The relative intensities of the principal spots from the *Standard preparations* are: *Solution A*, 1; *Solution B*, 0.01; *Solution C*, 0.005; and *Solution D*, 0.0025.]

**Assay**—Dissolve about 180 mg of Butalbital, accurately weighed, in a mixture of 25 mL of alcohol and 25 mL of sodium carbonate solution (3 in 100), and titrate with 0.1 N silver nitrate VS, determining the endpoint electrometrically, using a silver electrode, either with a suitable reference electrode containing a saturated aqueous solution of potassium nitrate, or a combination electrode in which the reference portion of the electrode contains a saturated aqueous solution of potassium nitrate. Each mL of 0.1 N silver nitrate is equivalent to 22.43 mg of  $C_{11}H_{16}N_2O_3$ .

## Butalbital, Acetaminophen, and Caffeine Capsules

» Butalbital, Acetaminophen, and Caffeine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of butalbital ( $C_{11}H_{16}N_2O_3$ ), acetaminophen ( $C_8H_9NO_2$ ), and caffeine ( $C_8H_{10}N_4O_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Acetaminophen RS

USP Butalbital RS

USP Caffeine RS

**Identification**—The retention times of the butalbital, acetaminophen, and caffeine peaks in the chromatogram of the *Assay preparation* correspond to those of the butalbital, acetaminophen, and caffeine peaks in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium:* water; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 60 minutes.

*Mobile phase and Chromatographic system*—Prepare as directed in the *Assay* under *Butalbital, Acetaminophen, and Caffeine Tablets*.

*Standard preparation*—Prepare a solution in methanol having known concentrations of about 0.02A mg of USP Acetaminophen RS per mL, 0.02B mg of USP Butalbital RS per mL, and 0.02C mg of USP Caffeine RS per mL, in which A, B, and C are the labeled amounts, in mg of acetaminophen, butalbital, and caffeine, respectively, per Capsule. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Pass a portion of the solution under test through a filter of 10-µm or finer porosity. Separately inject equal volumes (about 20 µL) of the filtrate and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg, of butalbital ( $C_{11}H_{16}N_2O_3$ ), acet-

aminophen ( $C_8H_9NO_2$ ), and caffeine ( $C_8H_{10}N_4O_2$ ) dissolved by the same formula:

$$900C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of the corresponding analyte obtained from the solution under test and the *Standard preparation*, respectively.

**Tolerances**—Not less than 80% ( $Q$ ) of the labeled amounts of  $C_{11}H_{16}N_2O_3$ ,  $C_8H_9NO_2$ , and  $C_8H_{10}N_4O_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

*Mobile phase, Internal standard solution, Butalbital standard stock solution, Caffeine standard stock solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Butalbital, Acetaminophen, and Caffeine Tablets.

*Assay preparation*—Remove, as completely as possible, the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about the weight of the contents of 1 Capsule, to a 200-mL volumetric flask, add *Internal standard solution* to volume, and mix. Sonicate for 15 minutes, mix, and allow to cool and settle. Transfer 20.0 mL of the clear supernatant to a 50-mL volumetric flask, dilute with water to volume, and mix. Pass a portion of this solution through a filter of 0.5  $\mu$ m or finer porosity, discarding the first 5 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the major peaks. Calculate the quantities, in mg, of butalbital ( $C_{11}H_{16}N_2O_3$ ), acetaminophen ( $C_8H_9NO_2$ ), and caffeine ( $C_8H_{10}N_4O_2$ ) in the portion of Capsules taken by the formula:

$$500D(R_U / R_S)$$

in which  $D$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the corresponding analyte to phenacetin obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Butalbital, Acetaminophen, and Caffeine Tablets

» Butalbital, Acetaminophen, and Caffeine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of butalbital ( $C_{11}H_{16}N_2O_3$ ), acetaminophen ( $C_8H_9NO_2$ ), and caffeine ( $C_8H_{10}N_4O_2$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Acetaminophen RS

USP Butalbital RS

USP Caffeine RS

**Identification**—The retention times of the butalbital peak, the acetaminophen peak, and the caffeine peak in the chromatogram of the *Assay preparation* correspond to those of the butalbital peak, the acetaminophen peak, and the caffeine peak in the chromatogram of the *Standard preparation*, as obtained in the Assay.

#### Dissolution, Procedure for a Pooled Sample (711)—

*Medium*: water; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 30 minutes.

*Mobile phase and Chromatographic system*—Prepare as directed in the Assay.

*Standard preparation*—Prepare a solution in methanol having known concentrations of about 0.02A mg of USP Acetaminophen RS per mL, 0.02B mg of USP Butalbital RS per mL, and 0.02C mg of USP Caffeine RS per mL, in which A, B, and C are the labeled amounts, in mg, of acetaminophen, butalbital, and caffeine, respectively, per Tablet. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Pass a portion of the solution under test through a suitable filter having a 10- $\mu$ m or finer porosity. Separately inject equal volumes (about 20  $\mu$ L) of the filtrate and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg, of butalbital ( $C_{11}H_{16}N_2O_3$ ), acetaminophen ( $C_8H_9NO_2$ ), and caffeine ( $C_8H_{10}N_4O_2$ ) dissolved by the same formula:

$$900C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of the corresponding analyte obtained from the solution under test and the *Standard preparation*, respectively.

**Tolerances**—Not less than 80% ( $Q$ ) of the labeled amounts of  $C_{11}H_{16}N_2O_3$ ,  $C_8H_9NO_2$ , and  $C_8H_{10}N_4O_2$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

*Mobile phase*—Transfer 800 mg of monobasic potassium phosphate to a 2000-mL volumetric flask. Dissolve in 1100 mL of water, dilute with methanol to volume, and mix. Pass through a suitable filter having a 0.5- $\mu$ m or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Prepare a solution of phenacetin in methanol containing 0.65 mg per mL.

*Butalbital standard stock solution*—Dissolve an accurately weighed quantity of USP Butalbital RS in *Internal standard solution* to obtain a solution having a known concentration of about 0.01B mg per mL, B being the labeled amount, in mg, of butalbital per Tablet, sonicating and shaking the solution, if necessary, to achieve complete dissolution.

*Caffeine standard stock solution*—Dissolve an accurately weighed quantity of USP Caffeine RS in *Internal standard solution* to obtain a solution having a known concentration of about 0.01C mg per mL, C being the labeled amount, in mg, of caffeine per Tablet, sonicating and shaking the solution, if necessary, to achieve complete dissolution.

*Standard preparation*—Transfer to a 50-mL volumetric flask about 0.1A mg of USP Acetaminophen RS, A being the labeled amount, in mg, of acetaminophen per Tablet, 10.0 mL of *Butalbital standard stock solution*, and 10.0 mL of *Caffeine standard stock solution*, sonicate for 5 minutes, dilute with water to volume, and mix. This solution contains about 0.002B mg of butalbital, 0.002A mg of acetaminophen, and 0.002C mg of caffeine per mL. Pass a portion of this solution through a suitable filter having a 0.5- $\mu$ m or finer porosity, and use the filtrate as the *Standard preparation*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1 average Tablet weight, to a 200-mL volumetric flask, add *Internal standard solution* to volume, and mix. Sonicate for 15 minutes, mix, and allow

to cool and settle. Transfer 20.0 mL of the clear supernatant to a 50-mL volumetric flask, dilute with water to volume, and mix. Pass a portion of this solution through a suitable filter having a 0.5- $\mu$ m or finer porosity, discarding the first 5 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 216-nm detector and a 4-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.16 for acetaminophen, 0.33 for caffeine, 0.77 for phenacetin, and 1.0 for butalbital; the resolution,  $R$ , between any two peaks is not less than 1.2; the column efficiency, calculated from the butalbital peak, is not less than 1000 theoretical plates; and the relative standard deviations of the acetaminophen, caffeine, and butalbital responses for replicate injections are not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for the major peaks. Calculate the quantities, in mg, of butalbital ( $C_{11}H_{16}N_2O_3$ ), acetaminophen ( $C_8H_9NO_2$ ), and caffeine ( $C_8H_{10}N_4O_2$ ) in the portion of Tablets taken by the same formula:

$$500D(R_U / R_S)$$

in which  $D$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the corresponding analyte to phenacetin obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Butalbital and Aspirin Tablets

» Butalbital and Aspirin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of butalbital ( $C_{11}H_{16}N_2O_3$ ) and aspirin ( $C_9H_8O_4$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Aspirin RS

USP Butalbital RS

USP Salicylic Acid RS

**Identification**—The retention times of the butalbital peak and the aspirin peak in the chromatogram of the *Assay preparation* correspond to those of the butalbital peak and the aspirin peak in the chromatograms of the *Butalbital and salicylic acid standard preparation* and the *Aspirin standard preparation*, as obtained in the *Assay for butalbital and aspirin and limit of free salicylic acid*.

**Dissolution** <711>—

**Medium:** water; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 60 minutes.

**Determination of dissolved butalbital**—

**Mobile phase**—Prepare a suitable filtered and degassed mixture of water, acetonitrile, and phosphoric acid (3100:725:4). Adjust the ratio as necessary.

**Standard preparation**—Dissolve accurately weighed quantities of USP Butalbital RS and of salicylic acid in *Mobile phase* to obtain a solution containing known concentrations of about 1  $\mu$ g of butalbital per mL for each mg of the labeled amount per Tablet and about 30  $\mu$ g of salicylic acid per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 214-nm detector and a 3.9-mm  $\times$  30-cm column that contains 10- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation* and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the butalbital and salicylic acid peaks is not less than 3.0; and the relative standard deviation of butalbital responses for replicate injections is not more than 3.0%.

**Procedure**—Filter a portion of the solution under test through a 0.5- $\mu$ m filter. Separately inject equal volumes (about 10 to 25  $\mu$ L) of the filtrate and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for aspirin, 0.85 for salicylic acid, and 1.0 for butalbital. [NOTE—After use, the column may be regenerated by passing through it at least 50 mL of a mixture of acetonitrile, methanol, and water (1:1:1), followed by 50 mL of a mixture of acetonitrile and water (1:1).] Calculate the amount, in mg, of butalbital ( $C_{11}H_{16}N_2O_3$ ) dissolved by the formula:

$$0.9C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Butalbital RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the butalbital peak responses obtained from the solution under test and the *Standard preparation*, respectively.

**Determination of dissolved aspirin**—

**pH 4.5 Buffer**—Dissolve 5.98 g of sodium acetate trihydrate in 500 mL of water, add 2.5 mL of glacial acetic acid, dilute with water to 1000 mL, and mix. Adjust this solution with glacial acetic acid to a pH of  $4.5 \pm 0.05$ , and mix.

**Procedure**—Determine the amount of aspirin ( $C_9H_8O_4$ ) dissolved from UV absorbances at the wavelength of the isosbestic point of aspirin and salicylic acid at  $265 \pm 2$  nm of filtered portions of the solution under test, diluted with 4 volumes of *pH 4.5 Buffer*, in comparison with a *Standard solution* having a known concentration of USP Aspirin RS in the same medium. [NOTE—Prepare the *Standard solution* at the time of use. An amount of alcohol not to exceed 1% of the total volume of the *Standard solution* may be used to bring the *Reference Standard* into solution prior to dilution first with water and then with 4 volumes of *pH 4.5 Buffer*.]

**Tolerances**—Not less than 75% (Q) of the labeled amounts of butalbital ( $C_{11}H_{16}N_2O_3$ ) and aspirin ( $C_9H_8O_4$ ) are dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Content Uniformity* with respect to butalbital and for *Weight Variation* with respect to aspirin.

**Assay for butalbital and aspirin and limit of free salicylic acid**—

**Mobile phase**—Prepare a suitable filtered and degassed mixture of water, acetonitrile, and phosphoric acid (3100:725:4). Adjust the ratio as necessary.

**Solvent mixture**—Mix 40 mL of formic acid and 4000 mL of acetonitrile.

**Butalbital standard stock solution**—Dissolve an accurately weighed quantity of USP Butalbital RS in *Solvent mixture* to obtain a solution having a known concentration of about 3250  $\mu$ g per mL,  $J$  being the ratio of the labeled amount, in mg, of butalbital to the labeled amount, in mg, of aspirin per tablet.

**Salicylic acid standard stock solution**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in *Solvent mixture* to obtain a solution having a known concentration of about 200  $\mu$ g per mL.

**Butalbital and salicylic acid standard preparation**—Transfer 25.0 mL of *Butalbital standard stock solution* and 3.0 mL of *Salicylic acid standard stock solution* to a 250-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. This

solution contains about 325  $\mu\text{g}$  of butalbital and 2.4  $\mu\text{g}$  of salicylic acid per mL.

**Aspirin standard preparation**—Dissolve an accurately weighed quantity of USP Aspirin RS in *Solvent mixture* to obtain a solution having a known concentration of about 325  $\mu\text{g}$  per mL.

**Resolution solution**—Transfer 4.0 mL of *Butalbital standard stock solution* and 3.0 mL of *Salicylic acid standard stock solution* to a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 80 mg of aspirin, to a 250-mL volumetric flask, dilute with *Solvent mixture* to volume, sonicate for 15 minutes, and mix. Pass a portion of this solution through a 0.5- $\mu\text{m}$  porosity filter before use.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 3.9-mm  $\times$  30-cm column that contains 10- $\mu\text{m}$  packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Butalbital and salicylic acid standard preparation*, the *Aspirin standard preparation*, and the *Resolution solution* as directed for *Procedure*: the resolution,  $R$ , between the butalbital and salicylic acid peaks is not less than 3.0; and the relative standard deviation for replicate injections of the Standard preparations is not more than 3.0% for butalbital and aspirin, and not more than 6.0% for salicylic acid.

**Procedure**—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard preparations* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks, and for the minor peak corresponding to salicylic acid. The relative retention times are about 0.6 for aspirin, 0.85 for salicylic acid, and 1.0 for butalbital. [NOTE—After use, the column may be regenerated by passing through it at least 50 mL of a mixture of acetonitrile, methanol, and water (1:1:1), followed by a mixture of acetonitrile and water (1:1).] Calculate the quantity, in mg, of butalbital ( $\text{C}_{11}\text{H}_{16}\text{N}_2\text{O}_3$ ) in the portion of Tablets taken by the formula:

$$0.25C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Butalbital RS in the *Butalbital and salicylic acid standard preparation*; and  $r_U$  and  $r_S$  are the butalbital peak responses obtained from the *Assay preparation* and the *Butalbital and salicylic acid standard preparation*, respectively. Calculate the quantity, in mg, of aspirin ( $\text{C}_9\text{H}_8\text{O}_4$ ) in the portion of Tablets taken by the formula:

$$0.25C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Aspirin RS in the *Aspirin standard preparation*; and  $r_U$  and  $r_S$  are the aspirin peak responses obtained from the *Assay preparation* and the *Aspirin standard preparation*, respectively. Calculate the percentage of free salicylic acid in the Tablets taken by the formula:

$$25(C / a)(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of the USP Salicylic Acid RS in the *Butalbital and salicylic acid standard preparation*;  $a$  is the quantity, in mg, of aspirin in the portion of Tablets taken, based on the labeled amount; and  $r_U$  and  $r_S$  are the salicylic acid peak responses obtained from the *Assay preparation* and the *Butalbital and salicylic acid standard preparation*, respectively: not more than 3.0% is found.

## Butalbital, Aspirin, and Caffeine Capsules

» Butalbital, Aspirin, and Caffeine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of butalbital ( $\text{C}_{11}\text{H}_{16}\text{N}_2\text{O}_3$ ), aspirin ( $\text{C}_9\text{H}_8\text{O}_4$ ), and caffeine ( $\text{C}_8\text{H}_{10}\text{N}_4\text{O}_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Aspirin RS  
USP Butalbital RS  
USP Caffeine RS  
USP Salicylic Acid RS

**Identification**—The retention times of the butalbital, aspirin, and caffeine peaks in the chromatogram of the *Assay preparation* correspond to those of the butalbital, aspirin, and caffeine peaks in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium*: water; 1000 mL.

*Apparatus 2*: 50 rpm.

*Time*: 60 minutes.

Determine the amounts of butalbital, aspirin, and caffeine dissolved employing the procedure set forth in the *Assay*, making any necessary modifications.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of butalbital ( $\text{C}_{11}\text{H}_{16}\text{N}_2\text{O}_3$ ), caffeine ( $\text{C}_8\text{H}_{10}\text{N}_4\text{O}_2$ ), and aspirin ( $\text{C}_9\text{H}_8\text{O}_4$ ) is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of free salicylic acid**—[NOTE—Use glassware in this test.]

**Solvent**—Add 1 mL of phosphoric acid to 1000 mL of methanol, and mix.

**Standard preparation**—Prepare a solution of USP Salicylic Acid RS in *Solvent* having a known concentration of about 0.0012 mg per mL. Use this solution promptly.

**Test preparation**—[NOTE—Perform this test on the same day the powder is removed from the Capsules.] Transfer an accurately weighed portion of the powder remaining from the preparation of the *Assay preparation* in the *Assay*, equivalent to about 65 mg of aspirin, to a 200-mL flask, add 100.0 mL of *Solvent*, and shake for about 1 minute. Promptly filter a portion of this solution, discarding the first 15 mL of the filtrate, and use the clear filtrate as the *Test preparation*. Use this solution within 20 minutes after the addition of the *Solvent*.

**Procedure**—Immediately place the cell containing the solution under test in the cell compartment of a spectrophotofluorimeter, and allow to equilibrate for 2 minutes. Concomitantly measure the intensities of the fluorescence of the *Test preparation* and the *Standard preparation* at 444 nm, using an excitation wavelength of 305 nm. Calculate the percentage of salicylic acid in the portion of Capsules taken by the formula:

$$10,000(C/a)(I_U / I_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard preparation*;  $a$  is the quantity, in mg, of aspirin in the portion of Capsules taken to prepare the *Test preparation*, based on the labeled amount; and  $I_U$  and  $I_S$  are the fluorescence intensity readings obtained from the *Test preparation* and the *Standard preparation*, respectively. [NOTE—If the intensity of the *Test preparation* greatly exceeds that of the *Standard preparation*, immediately transfer 5.0 mL of the *Test preparation* to a 50-mL volumetric

flask, dilute with *Solvent* to volume, and mix. Immediately determine the intensity of this solution, and calculate the percentage of salicylic acid in the portion of Capsules taken by the formula:

$$100,000(C/a)(I_U / I_S).$$

Not more than 2.5% is found.

#### Assay—

**0.01 M Phosphate buffer**—Dissolve 1.361 g of monobasic potassium phosphate in 1000 mL of water, and mix.

**Mobile phase**—Prepare a suitable filtered and degassed mixture of 0.01 M Phosphate buffer and methanol (550:450), and adjust with phosphoric acid to a pH of 3.9. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**pH 2.5 Buffer**—Prepare a mixture of 0.01 M Phosphate buffer and methanol (550:450), and adjust with phosphoric acid to a pH of 2.5 ± 0.05.

**Aspirin standard stock solution**—Dissolve an accurately weighed quantity of USP Aspirin RS in pH 2.5 Buffer to obtain a solution having a known concentration of about 1.6 mg per mL, sonicating and shaking the solution, if necessary, to achieve complete dissolution. Use this solution within 24 hours.

**Standard preparation**—Dissolve accurately weighed quantities of USP Butalbital RS and USP Caffeine RS quantitatively in *Aspirin standard stock solution* to obtain a solution having known concentrations of about 1.6J mg of USP Butalbital RS and 1.6J' mg of USP Caffeine RS per mL, J and J' being the ratios of the respective labeled amounts, in mg, of butalbital and caffeine to the labeled amount, in mg, of aspirin per Capsule, sonicating and shaking the solution, if necessary, to achieve complete dissolution. Use this solution within 24 hours.

**Salicylic acid solution**—Prepare a solution of salicylic acid in pH 2.5 Buffer containing about 0.1 mg per mL. Pass this solution through a suitable filter of 0.5-μm or finer porosity.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 325 mg of aspirin, to a 200-mL volumetric flask, dilute with pH 2.5 Buffer to volume, sonicate for about 30 minutes, and mix. Pass a portion of this solution through a suitable filter of 0.5-μm or finer porosity, and use the filtrate as the *Assay preparation*. Use this solution within 24 hours. [NOTE—Reserve the remaining portion of the powder for the test for *Limit of free salicylic acid*.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a detector set at the wavelength of the isosbestic point of aspirin and salicylic acid at about 277 nm and a 210-nm detector, and a 3.9-mm × 30-cm column that contains packing L1 and is maintained at 35 ± 1°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.45 for caffeine, 0.6 for aspirin, and 1.0 for butalbital; the resolution, *R<sub>s</sub>*, between the caffeine and aspirin peaks is not less than 2.0; the column efficiency determined from the butalbital peak is not less than 2000 theoretical plates; and the relative standard deviations of the caffeine, aspirin, and butalbital responses for replicate injections are not more than 2.0%. Inject 10 μL of the *Salicylic acid solution*, and record the peak response as directed for *Procedure*: the salicylic acid peak has the same retention time as that of the aspirin peak obtained in the chromatogram of the *Standard preparation*. [NOTE—If the retention time of the salicylic acid peak differs from that of the aspirin peak, adjust the pH of the *Mobile phase* with 0.2 N potassium hydroxide or 1 M phosphoric acid so that the salicylic acid peak has the same retention time as that of the aspirin peak. The retention time of the salicylic acid peak decreases

about 0.3 minute for each 0.1 pH increase. The retention time of the aspirin peak is essentially unaffected by such pH adjustments.]

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, using the 277-nm detector to record the caffeine and aspirin peak responses and the 210-nm detector to record the butalbital peak responses, and measure the areas for the major peaks. Calculate the quantities, in mg, of caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>), aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>), and butalbital (C<sub>11</sub>H<sub>16</sub>N<sub>2</sub>O<sub>3</sub>) in the portion of Capsules taken by the same formula:

$$200C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively. Correct the amount of aspirin obtained for the amount of salicylic acid present by the formula:

$$A - (0.01FA)$$

in which A is the quantity, in mg, of aspirin in the portion of Capsules taken to prepare the *Assay preparation*; and F is the percentage of salicylic acid obtained in the test for *Limit of free salicylic acid*.

## Butalbital, Aspirin, and Caffeine Tablets

» Butalbital, Aspirin, and Caffeine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of butalbital (C<sub>11</sub>H<sub>16</sub>N<sub>2</sub>O<sub>3</sub>), aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>), and caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Aspirin RS  
USP Butalbital RS  
USP Caffeine RS  
USP Salicylic Acid RS

**Identification**—The retention times of the butalbital, aspirin, and caffeine peaks in the chromatogram of the *Assay preparation* correspond to those of the butalbital, aspirin, and caffeine peaks in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution (711)—

**Medium:** water; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 60 minutes.

Determine the amounts of butalbital (C<sub>11</sub>H<sub>16</sub>N<sub>2</sub>O<sub>3</sub>), aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>), and caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>) dissolved by employing the procedure set forth in the *Assay* under *Butalbital, Aspirin, and Caffeine Capsules*, making any necessary modifications.

**Tolerances**—Not less than 80% (Q) of the labeled amounts of butalbital (C<sub>11</sub>H<sub>16</sub>N<sub>2</sub>O<sub>3</sub>), caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>), and aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>) is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of free salicylic acid**—[NOTE—Use glassware in this test.]

**Solvent**—Add 1 mL of phosphoric acid to 1000 mL of methanol, and mix.

**Standard preparation**—Prepare a solution of USP Salicylic Acid RS in *Solvent* having a known concentration of about 0.0012 mg per mL. Use this solution promptly.

**Test preparation**—[NOTE—Perform this test on the same day the tablets are powdered.] Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 65 mg of aspirin, to a 200-mL flask, add 100.0 mL of *Solvent*, and shake by mechanical means for 15 minutes. Filter a portion of this solution, discarding the first 15 mL of the filtrate, and use the clear filtrate as the *Test preparation*. Use this solution within 20 minutes after the addition of the *Solvent*.

**Procedure**—Immediately place the cell containing the solution under test in the cell compartment of a spectrophotofluorimeter, and allow to equilibrate for 2 minutes. Concomitantly measure the intensities of the fluorescence of the *Test preparation* and the *Standard preparation* at 444 nm, using an excitation wavelength of 305 nm. Calculate the percentage of salicylic acid in the portion of Tablets taken by the formula:

$$10,000(C/a)(I_U/I_S)$$

in which *C* is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard preparation*; *a* is the quantity, in mg, of aspirin in the portion of Tablets taken to prepare the *Test preparation*, based on the labeled amount; and *I<sub>U</sub>* and *I<sub>S</sub>* are the fluorescence intensity readings obtained from the *Test preparation* and the *Standard preparation*, respectively. [NOTE—If the intensity of the *Test preparation* greatly exceeds that of the *Standard preparation*, immediately transfer 5.0 mL of the *Test preparation* to a 50-mL volumetric flask, dilute with *Solvent* to volume, and mix. Immediately determine the intensity of this solution, and calculate the percentage of salicylic acid in the portion of Tablets taken by the formula:  $100,000(C/a)(I_U/I_S)$ .] Not more than 3.0% is found.

#### Assay—

0.01 M Phosphate buffer, Mobile phase, pH 2.5 Buffer, Aspirin standard stock solution, Standard preparation, Salicylic acid solution, and Chromatographic system—Proceed as directed in the Assay under Butalbital, Aspirin, and Caffeine Capsules.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 325 mg of aspirin, to a 200-mL volumetric flask, dilute with pH 2.5 buffer to volume, and sonicate for 30 minutes. Pass a portion of this solution through a suitable filter of 0.5 µm or finer porosity, and use the filtrate as the *Assay preparation*. Use this solution within 24 hours.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, using the 277-nm detector to record the caffeine and aspirin peak areas and the 210-nm detector to record the butalbital peak areas, and measure the peak areas for the major peaks. Calculate the quantities, in mg, of butalbital ( $C_{11}H_{16}N_2O_3$ ), aspirin ( $C_9H_8O_4$ ), and caffeine ( $C_8H_{10}N_4O_2$ ) in the portion of Tablets taken by the same formula:

$$200C(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively. Correct the amount of as-

pirin obtained for the amount of salicylic acid present taken by the formula:

$$A - (0.01FA)$$

in which *A* is the quantity, in mg, of aspirin in the portion of Tablets taken to prepare the *Assay preparation*; and *F* is the percentage of salicylic acid obtained in the test for Limit of free salicylic acid.

## Butalbital, Aspirin, Caffeine, and Codeine Phosphate Capsules

» Butalbital, Aspirin, Caffeine, and Codeine Phosphate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of butalbital ( $C_{11}H_{16}N_2O_3$ ), aspirin ( $C_9H_8O_4$ ), caffeine ( $C_8H_{10}N_4O_2$ ), and codeine phosphate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Aspirin RS  
USP Butalbital RS  
USP Caffeine RS  
USP Codeine Phosphate RS  
USP Salicylic Acid RS

**Identification**—The retention times of the butalbital, aspirin, caffeine, and codeine peaks in the chromatograms of the *Assay preparation* correspond to those of the butalbital, aspirin, caffeine, and codeine peaks in the chromatograms of the *Standard preparation*, as obtained in the Assay.

#### Dissolution (711)—

Medium: water; 1000 mL.

Apparatus 2: 50 rpm.

Time: 60 minutes.

0.01 M Phosphate buffer, pH 2.5 Buffer, Mobile phase, and Salicylic acid solution—Prepare as directed in the Assay.

**Dilute salicylic acid solution**—Transfer 5.0 mL of Salicylic acid solution, prepared as directed in the Assay, to a 50-mL volumetric flask, dilute with pH 2.5 Buffer to volume, and mix. Pass through a suitable filter of 0.5 µm or finer porosity.

**Aspirin standard stock solution**—Prepare a solution of USP Aspirin RS in a mixture of pH 2.5 Buffer and Dissolution Medium (1:1) containing a known concentration of about 0.16 mg per mL. Use this solution within 24 hours.

**Standard preparation**—Dissolve accurately weighed quantities of USP Butalbital RS, USP Caffeine RS, and USP Codeine Phosphate RS quantitatively in *Aspirin standard stock solution* to obtain a solution having known concentrations of about 0.16/ mg of USP Butalbital RS, 0.16/ mg of USP Caffeine RS, and 0.16/ mg of USP Codeine Phosphate RS per mL, *J*, *J'*, and *J''* being the ratios of the respective labeled amounts, in mg, of butalbital, caffeine, and codeine phosphate to the labeled amount, in mg, of aspirin per Capsule, sonicating and shaking the solution, if necessary to achieve complete dissolution. Pass a portion of this solution through a suitable filter of 0.5 µm or finer porosity. Use this solution within 24 hours.

**Chromatographic system**—Proceed as directed for Chromatographic system in the Assay, except to inject 100 µL, instead of 10 µL, into the chromatograph, and to use Dilute salicylic acid solution instead of Salicylic acid solution.

**Procedure**—Pass about 20 mL of the solution under test through a suitable filter of 0.5-µm or finer porosity, discard-

ing the first 2 mL of the filtrate. Mix 5.0 mL of the filtrate and 5.0 mL of *pH 2.5 Buffer* to obtain the *Test preparation*. Separately inject equal volumes (about 100  $\mu$ L) of the *Test preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, using the 277-nm detector to record the caffeine and aspirin peaks and the 210-nm detector to record the butalbital and codeine responses, and measure the areas for the major peaks. Calculate the quantities, in mg, of caffeine ( $C_8H_{10}N_4O_2$ ), aspirin ( $C_9H_8O_4$ ), and butalbital ( $C_{11}H_{16}N_2O_3$ ) dissolved by the same formula:

$$2000C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of the corresponding analyte obtained from the *Test preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) dissolved by the formula:

$$(406.37 / 397.37)(2000C)(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively; *C* is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the codeine peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively.

**Tolerances**—Not less than 75% (*Q*) of the labeled amounts of butalbital ( $C_{11}H_{16}N_2O_3$ ), aspirin ( $C_9H_8O_4$ ), caffeine ( $C_8H_{10}N_4O_2$ ), and codeine phosphate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) are dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of free salicylic acid**—[NOTE—Use glassware in this test.]

**Solvent**—Add 1 mL of phosphoric acid to 1000 mL of methanol, and mix.

**Standard preparation**—Prepare a solution of USP Salicylic Acid RS in *Solvent* having a known concentration of about 0.0012 mg per mL. Use this solution promptly.

**Test preparation**—[NOTE—Perform this test on the same day the powder is removed from the Capsules.] Transfer an accurately weighed portion of the powder remaining from the preparation of the *Assay preparation* in the *Assay*, equivalent to about 65 mg of aspirin, to a 200-mL flask, add 100.0 mL of *Solvent*, and shake for about 1 minute. Filter a portion of this solution, discarding the first 15 mL of the filtrate, and use the clear filtrate as the *Test preparation*. Use this solution within 20 minutes after the addition of the *Solvent*.

**Procedure**—Immediately place the cell containing the solution under test in the cell compartment of a spectrophotofluorimeter, and allow to equilibrate for 2 minutes. Concomitantly measure the intensities of the fluorescence of the *Test preparation* and the *Standard preparation* at 444 nm using an excitation wavelength of 305 nm. Calculate the percentage of salicylic acid in the portion of Capsules taken by the formula:

$$10,000(C / a)(I_U / I_S)$$

in which *C* is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard preparation*; *a* is the quantity, in mg, of aspirin in the portion of Capsules taken to prepare the *Test preparation*, based on the labeled amount; and  $I_U$  and  $I_S$  are the fluorescence intensity readings obtained from the *Test preparation* and the *Standard preparation*, respectively. [NOTE—If the intensity of the *Test preparation* greatly exceeds that of the *Standard preparation*, immediately transfer 5.0 mL of the *Test preparation* to a 50-mL volumetric

flask, dilute with *Solvent* to volume, and mix. Immediately determine the intensity of this solution, and calculate the percentage of salicylic acid in the portion of Capsules taken by the formula:

$$100,000(C / a)(I_U / I_S)]$$

Not more than 3.0% is found.

#### Assay—

**0.01 M Phosphate buffer**—Dissolve 1.361 g of monobasic potassium phosphate in 1000 mL of water, and mix.

**Mobile phase**—Prepare a suitable mixture of 0.01 M Phosphate buffer and methanol (550:450), and adjust with phosphoric acid to a pH of 3.9. Pass through a suitable filter of 0.5- $\mu$ m or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**pH 2.5 Buffer**—Prepare a mixture of 0.01 M Phosphate buffer and methanol (550:450), and adjust with phosphoric acid to a pH of 2.5  $\pm$  0.05.

**Aspirin standard stock solution**—Dissolve an accurately weighed quantity of USP Aspirin RS in *pH 2.5 Buffer* to obtain a solution having a known concentration of about 1.6 mg per mL, sonicating and shaking the solution, if necessary, to achieve complete dissolution. Use this solution within 24 hours.

**Standard preparation**—Dissolve accurately weighed quantities of USP Butalbital RS, USP Caffeine RS, and USP Codeine Phosphate RS quantitatively in *Aspirin standard stock solution* to obtain a solution having known concentrations of about 1.6J mg of USP Butalbital RS, 1.6J' mg of USP Caffeine RS, and 1.6J'' mg of USP Codeine Phosphate RS per mL, *J*, *J'*, and *J''* being the ratios of the respective labeled amounts, in mg, of butalbital, caffeine, and codeine phosphate to the labeled amount, in mg, of aspirin per Capsule, sonicating and shaking the solution, if necessary, to achieve complete dissolution.

**Salicylic acid solution**—Prepare a solution of salicylic acid in *pH 2.5 Buffer* containing about 0.1 mg per mL. Pass this solution through a suitable filter of 0.5  $\mu$ m or finer porosity.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 325 mg of aspirin, to a 200-mL volumetric flask, dilute with *pH 2.5 Buffer* to volume, sonicate for about 30 minutes, and mix. Pass a portion of this solution through a suitable filter of 0.5  $\mu$ m or finer porosity, and use the filtrate as the *Assay preparation*. Use this solution within 24 hours. [NOTE—Reserve the remaining portion of the powder for the test for *Limit of free salicylic acid*.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a detector set at the wavelength of the isosbestic point of aspirin and salicylic acid at about 277 nm and a 210-nm detector, and a 3.9-mm  $\times$  30-cm column that contains packing L1 and is maintained at 35  $\pm$  1°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.3 for codeine, 0.45 for caffeine, 0.6 for aspirin, and 1.0 for butalbital; the resolution, *R*, between the caffeine and aspirin peaks is not less than 2.0; the column efficiency determined from the butalbital peak is not less than 2000 theoretical plates; and the relative standard deviations of the codeine, caffeine, aspirin, and butalbital responses for replicate injections are not more than 2.0%. Inject 10  $\mu$ L of the *Salicylic acid solution*, and record the peak response as directed for *Procedure*: the salicylic acid peak has the same retention time as that of the aspirin peak obtained in the chromatogram of the *Standard preparation*. [NOTE—If the retention time of the salicylic acid peak differs from that of the aspirin peak, adjust the pH of the *Mobile phase* with 0.2 N potassium hydroxide or 1 M phosphoric acid so that the salicylic acid peak has the same retention time as that of the aspirin peak. The retention time of the salicylic acid

peak decreases about 0.3 minute for each 0.1 pH increase. The retention time of the aspirin peak is essentially unaffected by such pH adjustments.]

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, using the 277-nm detector to record the caffeine and aspirin peak responses and the 210-nm detector to measure the codeine and butalbital responses, and measure the areas for the major peaks. Calculate the quantities, in mg, of caffeine ( $C_8H_{10}N_4O_2$ ), aspirin ( $C_9H_8O_4$ ), and butalbital ( $C_{11}H_{16}N_2O_3$ ) in the portion of Capsules taken by the same formula:

$$200C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of the corresponding analyte obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of codeine phosphate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) in the portion of Capsules taken by the formula:

$$(406.37 / 397.37)(200C)(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $C$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the codeine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Correct the amount of aspirin obtained for the amount of salicylic acid present by the formula:

$$A - (0.01FA)$$

in which  $A$  is the quantity, in mg, of aspirin in the portion of Capsules taken to prepare the *Assay preparation*; and  $F$  is the percentage of salicylic acid obtained in the test for *Limit of free salicylic acid*.

## Butamben

$C_{11}H_{15}NO_2$  193.24  
Benzoic acid, 4-amino-, butyl ester.  
Butyl *p*-aminobenzoate [94-25-7].

» Butamben, dried over phosphorus pentoxide for 3 hours, contains not less than 98.0 percent and not more than 101.0 percent of  $C_{11}H_{15}NO_2$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Butamben RS

**Completeness and color of solution**—One g dissolves completely in 30 mL of alcohol and in 30 mL of ether, and the solutions are colorless.

**Identification, Infrared Absorption** (197K).

**Melting range, Class I** (741): between 57° and 59°.

**Reaction**—Dissolve 1 g in 10 mL of neutralized alcohol: a clear solution results. Dilute this solution with 10 mL of water, and add 2 drops of phenolphthalein TS and 1 drop of 0.1 N sodium hydroxide: a red color is produced.

**Loss on drying** (731)—Dry it over phosphorus pentoxide for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Chloride**—To a solution of 200 mg in 10 mL of alcohol add 1 mL of 2 N nitric acid and a few drops of silver nitrate TS: no opalescence is produced.

**Heavy metals, Method I** (231)—Dissolve 2 g in 2 mL of 1 N acetic acid and sufficient alcohol to make 25 mL: the limit is 0.001%.

**Assay**—

*Ferrocypen indicator solution*—Dissolve, without warming, 0.5 g of ferrocypen in 50 mL of sulfuric acid.

**Procedure**—Dissolve about 400 mg of Butamben, previously dried and accurately weighed, in a mixture of 100 mL of water and 20 mL of hydrochloric acid. Add 1 mL of *Ferrocypen indicator solution*. Cool the solution in an ice bath to about 10°, and titrate with 0.1 M sodium nitrite VS to a violet endpoint that is stable for not less than three minutes. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M sodium nitrite is equivalent to 19.32 mg of  $C_{11}H_{15}NO_2$ .

## Butoconazole Nitrate

$C_{19}H_{17}Cl_3N_2S \cdot HNO_3$  474.79  
1H-Imidazole, 1-[4-(4-chlorophenyl)-2-[(2,6-dichlorophenyl)thio]butyl-, mononitrate, ( $\pm$ )-.  
( $\pm$ )-1-[4-(*p*-Chlorophenyl)-2-[(2,6-dichlorophenyl)thio]butyl]imidazole mononitrate [64872-77-1].

» Butoconazole Nitrate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{19}H_{17}Cl_3N_2S \cdot HNO_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—  
USP Butoconazole Nitrate RS

**Identification, Infrared Absorption** (197K).

**Loss on drying** (731)—Dry it in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Ordinary impurities** (466)—

*Test solution*: a mixture of methylene chloride and methanol (2:1).

*Standard solutions*: a mixture of methylene chloride and methanol (2:1).

*Adsorbent*: a 0.25-mm layer of chromatographic silica gel.

*Eluant*: a mixture of chloroform, tetrahydrofuran, cyclohexane, and ammonium hydroxide (18:18:13:1).

*Visualization*: 22.

**Assay**—

*Phosphate buffer*—Dissolve 2.18 g of monobasic potassium phosphate and 4.18 g of dibasic potassium phosphate in 900 mL of water, dilute with water to 1000 mL, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and *Phosphate buffer* (3:1), making adjustments if

necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Butoconazole Nitrate RS in *Mobile phase*, and quantitatively dilute with *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

**Assay preparation**—Transfer about 20 mg of Butoconazole Nitrate, accurately weighed, to a 100-mL volumetric flask, and dissolve in *Mobile phase*. Dilute with *Mobile phase* to volume, mix, and filter.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 229-nm detector and a 4.6-mm × 25-cm column that contains packing L1 and is maintained at 40°. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 2800 theoretical plates; the tailing factor for the analyte peak is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{19}H_{17}Cl_3N_2S \cdot HNO_3$  in the portion of Butoconazole Nitrate taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Butoconazole Nitrate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Butoconazole Nitrate Vaginal Cream

» Butoconazole Nitrate Vaginal Cream is Butoconazole Nitrate in a suitable cream base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of butoconazole nitrate ( $C_{19}H_{17}Cl_3N_2S \cdot HNO_3$ ).

**Packaging and storage**—Preserve in collapsible tubes or tight containers. Avoid excessive heat and avoid freezing.

**USP Reference standards** (11)—

USP Butoconazole Nitrate RS

**Identification**—Prepare a mixture of the *Standard preparation* and the *Assay preparation* (1:1), prepared as directed in the *Assay*, and chromatograph as directed in the *Assay*: the chromatogram so obtained exhibits two main peaks, corresponding to butoconazole nitrate and the internal standard.

**Minimum fill** (755): meets the requirements.

**Assay**—

**Acetate buffer**—Dissolve 1.4 g of potassium acetate in 980 mL of water, adjust with about 2 mL of glacial acetic acid to a pH of  $4.3 \pm 0.1$ , dilute with water to 1000 mL, and mix. Adjust the buffer molarity (0.018–0.072 M) as necessary to obtain suitable chromatographic performance. Increased retention time may be achieved by a decrease in the buffer molarity.

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and *Acetate buffer* (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Diluent**—Prepare a mixture of methanol and *Acetate buffer* (6:4).

**Internal standard solution**—Dissolve 1-benzylimidazole in methanol to obtain a solution containing about 1.6 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Butoconazole Nitrate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a stock solution having a known concentration of about 400 µg per mL. Transfer 2.0 mL of this stock solution and 3.0 mL of *Internal standard solution* to a 50-mL flask, add 35.0 mL of *Diluent*, and mix.

**Assay preparation**—Place about 200 mL of methanol in a 250-mL volumetric flask. Transfer to the flask an accurately weighed quantity of Vaginal Cream, equivalent to about 100 mg of butoconazole nitrate, and sonicate until the Vaginal Cream is dissolved completely. Cool to room temperature, dilute with methanol to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL flask, add 3.0 mL of *Internal standard solution* and 35.0 mL of *Diluent*, and mix. Allow the precipitated excipients which form to rise to the top of the solution, remove them by aspiration, and discard. Centrifuge or filter the remaining solution.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L9 which has been converted to the potassium form by the use of 0.555 M potassium acetate solution. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for butoconazole nitrate and 1.0 for 1-benzylimidazole; the resolution,  $R$ , between the analyte and internal standard peaks is not less than 4.0; the column efficiency determined from the analyte peak is not less than 1100 theoretical plates; the tailing factor for the analyte peak is not more than 2.1; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of butoconazole nitrate ( $C_{19}H_{17}Cl_3N_2S \cdot HNO_3$ ) in the portion of Vaginal Cream taken by the formula:

$$0.25C(R_U / R_S)$$

in which C is the concentration, in µg per mL, of USP Butoconazole Nitrate RS in the stock solution used to prepare the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of butoconazole nitrate to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Butorphanol Tartrate

$C_{21}H_{29}NO_2 \cdot C_4H_6O_6$  477.55  
Morphinan-3,14-diol, 17-(cyclobutylmethyl)-, (-)-, [5-( $R^*$ ,  $R^*$ )]-2,3-dihydroxybutanedioate (1:1) (salt).  
(-)-17-(Cyclobutylmethyl)morphinan-3,14-diol D-(-)-tartrate (1:1) (salt) [58786-99-5].

» Butorphanol Tartrate contains not less than 98.0 percent and not more than 102.0 percent of

$C_{21}H_{29}NO_2 \cdot C_4H_6O_6$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—  
USP Butorphanol Tartrate RS

**Identification**—

A: *Infrared Absorption* (197K).

B: The  $R_f$  value of the principal spot in the chromatogram of the *Test preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained for test A in the *Chromatographic purity* test.

**Specific rotation** (781S): between  $-60^\circ$  and  $-66^\circ$ .

*Test solution*: 4 mg per mL, in methanol.

**Water**, *Method I* (921): not more than 2.0%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, *Method II* (231): 0.003%.

**Chromatographic purity**—

METHOD A (Thin-Layer Chromatography)—

*Standard solution*—Prepare a solution in methanol containing 1 mg of USP Butorphanol Tartrate RS per mL.

*Test solution*—Transfer 100 mg of Butorphanol Tartrate to a 10-mL volumetric flask. Dissolve in methanol, dilute with methanol to volume, and mix.

*Iodoplatinate spray reagent*—Prepare a 1 in 10 solution of chloroplatinic acid in water. To 0.5 mL of this solution add 33 mL of water and 1 g of potassium iodide to obtain the spray reagent. Prepare fresh daily.

*Procedure*—Apply 50  $\mu$ L of the *Test solution*, containing 500  $\mu$ g of butorphanol tartrate, and 5  $\mu$ L and 10  $\mu$ L of the *Standard solution*, containing 5  $\mu$ g and 10  $\mu$ g of USP Butorphanol Tartrate RS, respectively, about 2 cm apart to a line parallel to and about 2 cm from the bottom of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Place the plate in a developing chamber containing, and equilibrated with, a mixture of chloroform, methanol, benzene, and ammonium hydroxide (85:25:20:5). Develop the chromatogram until the solvent front has moved about 10 cm above the line of application. Remove the plate, mark the solvent front, and allow the solvent to evaporate. Spray the plate with *Iodoplatinate spray reagent*. Estimate the percentage of the impurities present in the *Test solution* by comparing the intensities of secondary spots, if present, with the intensities of the principal spots obtained from the chromatograms of the *Standard solution*. The sum of the impurities observed is not greater than 2.0%.

METHOD B (Gas Chromatography)—Dissolve a suitable quantity of Butorphanol Tartrate in methanol to obtain a solution containing about 10 mg per mL. Inject 1  $\mu$ L of this solution into a suitable gas chromatograph equipped with a flame-ionization detector and a 1.8-m  $\times$  4-mm glass column containing 3% liquid phase G3 on support S1AB. The temperatures of the injection port, column, and detector are maintained at about 280°, 250°, and 290°, respectively. The carrier gas is nitrogen. Record a 30-minute chromatogram. Preferably using an electronic integrator, determine the areas of all peaks in the chromatogram excluding the area of the solvent. In a suitable chromatogram, the retention time for the alpha isomer of butorphanol tartrate is 1.2 relative to 1.0 for butorphanol tartrate; and the retention time of butorphanol tartrate is not less than 15 minutes. Calculate the percentage of synthesis precursors in the test specimen by the formula:

$$100A_v / A_s$$

in which  $A_v$  is the sum of the areas of all minor peaks; and  $A_s$  is the sum of the areas of the major and minor peaks. The limit is 2.0%.

**Assay**—Dissolve about 500 mg of Butorphanol Tartrate, accurately weighed, in 75 mL of glacial acetic acid. Add crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 47.76 mg of  $C_{21}H_{29}NO_2 \cdot C_4H_6O_6$ .

## Butorphanol Tartrate Injection

» Butorphanol Tartrate Injection is a sterile solution of Butorphanol Tartrate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{21}H_{29}NO_2 \cdot C_4H_6O_6$ . It may contain a suitable preservative and a buffer.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Butorphanol Tartrate RS

USP Endotoxin RS

**Identification**—Apply 10- $\mu$ L portions of the Injection and a Standard solution of USP Butorphanol Tartrate RS having the same concentration about 2 cm apart to a line parallel to and about 2 cm from the bottom of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Place the plate in a developing chamber containing a mixture of chloroform, ethyl acetate, and methanol (40:10:9), and develop the chromatogram until the solvent front has moved about 10 cm above the line of application. Remove the plate, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution. Benzethonium chloride, if present, is observed as a streaked zone near the point of application. Visualize the butorphanol spots by lightly spraying the plate with a 1 in 250 solution of bromocresol purple in dehydrated alcohol: butorphanol appears as a blue spot against a light yellow background.

**pH** (791): between 3.0 and 5.5.

**Bacterial endotoxins** (85)—It contains not more than 88.0 USP Endotoxin Units per mg of butorphanol tartrate.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Mobile phase*—Prepare a mixture of 0.05 M ammonium acetate and acetonitrile (3:1) adjusted by the addition of glacial acetic acid to a pH of 4.1. The mixture is appropriately filtered and degassed.

*Internal standard solution*—Dissolve about 50 mg of propylparaben in 5.0 mL of methanol contained in a 250-mL volumetric flask. Add water to volume, and mix.

*Standard preparation*—Transfer about 50 mg of USP Butorphanol Tartrate RS, accurately weighed, to a 25-mL volumetric flask containing 1.0 mL of 1 N sulfuric acid. Swirl the flask to dissolve the powder completely, add water to volume, and mix. Pipet 5 mL of the resulting solution into a 50-mL volumetric flask containing 10.0 mL of *Internal standard solution*. Add water to volume, mix, and filter through a microporous filter, discarding the first 5 mL of the filtrate and collecting the remainder in a suitable container.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of butorphanol tartrate, to a 50-mL volumetric flask. Add 10.0 mL of *Internal standard solution*, mix, add water to volume, and mix.

Filter through a microporous filter, discarding the first 5 mL of the filtrate and collecting the remainder in a suitable container.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm × 30-cm column that contains packing L11. The flow rate is about 2 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 1.5%, and the capacity factor for butorphanol tartrate is not less than 2.0.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, adjusting the flow rate and other operating parameters, if necessary, until satisfactory chromatography and peak responses are obtained. Record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 1.7 for propylparaben and 1.0 for butorphanol tartrate. Calculate the quantity, in mg, of  $C_{21}H_{29}NO_2 \cdot C_4H_6O_6$  in each mL of the Injection taken by the formula:

$$50(C/V)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Butorphanol Tartrate RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $R_U$  and  $R_S$  are the peak response ratios of the butorphanol tartrate peak and the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Butorphanol Tartrate Nasal Solution

» Butorphanol Tartrate Nasal Solution is an aqueous solution of butorphanol tartrate for administration as a metered spray to the nasal mucosa. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of butorphanol tartrate ( $C_{21}H_{29}NO_2 \cdot C_4H_6O_6$ ).

**Packaging and storage**—Preserve in tight containers at controlled room temperature. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** <11>—  
USP Butorphanol Tartrate RS

### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** *Thin-Layer Chromatographic Identification Test* <201>—

**Test solution**—Prepare a composite solution by pooling the contents of three containers of Nasal Solution into a suitable vessel. Transfer 1.0 mL of pooled sample to a 10-mL volumetric flask, and dilute with methanol to volume.

**Standard solution**—Dissolve an accurately weighed quantity of USP Butorphanol Tartrate RS in methanol to obtain a solution having a known concentration of about 1.0 mg per mL.

**Developing solvent system**—Prepare a mixture of chloroform, methanol, benzene, and ammonium hydroxide (17:5:4:1). Mix thoroughly. [Caution—Prepare in a hood while wearing appropriate safety gloves, lab coat, and protective eyewear.]

**Spray reagent**—Prepare a 1 in 10 solution of chloroplatinic acid in water. To 0.5 mL of this solution, add 33 mL of water and 1 g of potassium iodide. Prepare fresh daily.

**Procedure**—Proceed as directed in the chapter, except to spray the plate with *Spray reagent*. The typical  $R_f$  value is about 0.7 for butorphanol tartrate.

**Osmolality** <785>: between 252 and 292 mOsmol per kg.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—The total aerobic microbial count does not exceed 1000 cfu per g or mL, and the total combined molds and yeasts count does not exceed 100 cfu per g or mL. It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**pH** <791>: between 4.0 and 6.0.

### Related compounds—

**Phosphate buffer** (0.025 M)—Prepare as directed in the *Assay*.

**Mobile phase**—Prepare a filtered and degassed mixture of phosphate buffer, acetonitrile, and triethylamine (85:15:5.1). Mix thoroughly, and adjust with 85.0% phosphoric acid to a pH of  $3.0 \pm 0.1$ . Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard solution**—Dissolve an accurately weighed quantity of USP Butorphanol Tartrate RS in water, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.005 mg per mL.

**Sensitivity solution**—Transfer 2.5 mL of the *Standard solution* to a 50-mL volumetric flask, dilute with water to volume, and mix. Do not filter.

**Test solution**—Prepare a composite solution by pooling a minimum of four containers of Nasal Solution into a suitable glass vessel. Transfer the equivalent of 50 mg of butorphanol tartrate to a 50-mL volumetric flask. Dilute with water to volume, and mix. Do not filter.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector, a 4.6-mm × 25-cm column that contains 5-µm packing L11, and a 4.6-mm × 1-cm guard column packed with 5-µm packing L11. The column temperature is maintained at 40°. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for six replicate injections is not more than 10.0%. Chromatograph the *Sensitivity solution*, and record the peak responses as directed for *Procedure*: the peak height for butorphanol tartrate is greater than or equal to three times the baseline noise.

**Procedure**—Separately inject equal volumes (about 60 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the butorphanol tartrate peak in the *Standard solution* and for all known and unknown related compounds in the *Test solution*. The chromatographic run time is about 40 minutes. Calculate the percentage of each related compound (see *Table 1*) and each unknown impurity in the portion of Nasal Solution taken by the formula:

$$5000(C/VLA)(r_i/r_s)$$

in which C is the concentration, in mg per mL, of USP Butorphanol Tartrate RS in the *Standard solution*; V is the volume of sample taken; LA is the labeled amount, in mg per mL, of butorphanol tartrate in the sample;  $r_i$  is the peak response of each known or unknown related compound in the *Test solution*; and  $r_s$  is the peak response of butorphanol tartrate in the *Standard solution*: the impurities meet the requirements specified in *Table 1*.

Table 1

Compound	Relative Retention Time	Limit (%)
3,14-Dihydroxymorphinan	0.3	0.3
$\Delta^6$ -Butorphanol	0.7	0.5
Butorphanol tartrate	1.0	—
Unknown impurity	—	0.3
Total impurities	—	1.0

**Assay—**

*Phosphate buffer (0.025 M)*—Transfer 3.4 g of monobasic potassium phosphate into a 1000-mL volumetric flask. Dilute with water to volume, and filter.

*Mobile phase*—Prepare a filtered and degassed mixture of phosphate buffer, acetonitrile, and triethylamine (85:15:2). Mix thoroughly, and adjust with 85.0% phosphoric acid to a pH of  $3.0 \pm 0.1$ . Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Butorphanol Tartrate RS in *Mobile phase* to obtain a solution having a known concentration of 0.2 mg per mL. Mix, and filter, discarding the first 2 mL of the filtrate. The *Standard preparation* is stable for at least 108 hours.

*Assay preparation*—Prepare a composite solution by pooling a minimum of four containers of Nasal Solution into a

suitable glass vessel. Transfer the equivalent of 20 mg of butorphanol tartrate to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, mix, and filter, discarding the first 2 mL of the filtrate.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector, a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L11, and a 4.6-mm  $\times$  1-cm guard column that contains 5- $\mu$ m packing L11. The column temperature is maintained at 30°. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the butorphanol tartrate peak is not more than 2.0; and the relative standard deviation for five replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the butorphanol tartrate peak. Calculate the quantity, in mg, of butorphanol tartrate ( $C_{21}H_{29}NO_2 \cdot C_4H_6O_6$ ) in the portion of Nasal Solution taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Butorphanol Tartrate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses for butorphanol tartrate obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cabergoline

$C_{26}H_{37}N_5O_2$  451.60  
 Ergoline-8 $\beta$ -carboxamide, *N*-[3-(dimethylamino)propyl]-*N*-[(ethylamino)carbonyl]-6-(2-propenyl)-; 1-[(6-Allylergolin-8 $\beta$ -yl)carbonyl]-1-[3-(dimethylamino)propyl]-3-ethylurea [81409-90-7].

### DEFINITION

Cabergoline contains NLT 98.0% and NMT 102.0% of the labeled amount of  $C_{26}H_{37}N_5O_2$ , calculated on the anhydrous basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

[NOTE—Prepare solutions immediately before use and protect from light.]

**Buffer:** Dissolve 6.8 g of monobasic potassium phosphate in 900 mL of water, adjust with phosphoric acid to a pH of 2.0, and dilute to 1 L. Add 0.2 mL of triethylamine to the resulting solution and mix.

**Mobile phase:** Acetonitrile and *Buffer* (4:21)

**Standard solution:** 0.25 mg/mL of USP Cabergoline RS in *Mobile phase*. [NOTE—Sonicate if needed.]

**Sample solution:** 0.25 mg/mL of Cabergoline in *Mobile phase*. [NOTE—Sonicate if needed.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.0-mm  $\times$  25-cm; 10  $\mu$ m packing L1

**Flow rate:** 1.3 mL/min

**Injection size:** 100  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 1000 theoretical plates

**Relative standard deviation:** NMT 2.0% for five replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{26}H_{37}N_5O_2$  in the portion of Cabergoline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the *Sample solution*

$r_S$  = peak response of the *Standard solution*

$C_S$  = concentration of USP Cabergoline RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Cabergoline in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

### IMPURITIES

#### Inorganic Impurities

- RESIDUE ON IGNITION** (281): NMT 0.1%
- HEAVY METALS**, *Method II* (231): 20 ppm

### Organic Impurities

#### PROCEDURE

[NOTE— Prepare solutions immediately before use, and protect from light.]

**Buffer and Mobile phase:** Proceed as directed in the *Assay*.

**System suitability solution:** To 10 mL of 0.1 M sodium hydroxide add 50 mg of Cabergoline and stir for about 15 min. To 1 mL of the suspension add 1 mL of 0.1 M hydrochloric acid, and dilute with *Mobile phase* to 10.0 mL. Sonicate until dissolution is complete. [NOTE— The main degradation product obtained is cabergoline related compound A.]

**Sample solution:** 0.25 mg/mL of Cabergoline in *Mobile phase*. [NOTE—Sonicate if needed.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.0-mm  $\times$  25-cm; 10  $\mu$ m packing L1

**Flow rate:** 1.3 mL/min

**Injection size:** 100  $\mu$ L

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 3.0 between cabergoline and cabergoline related compound A

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Cabergoline taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_T$  = sum of the peak responses for all peaks from the *Sample solution*

#### Acceptance criteria

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 0.8%

**Impurity Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Cabergoline related compound D <sup>a</sup>	0.3	0.1
Cabergoline related compound B <sup>b</sup>	0.6	0.1

Cabergoline related compound C <sup>d</sup>	2.9	0.3
Any other individual, unidentified impurity	—	0.10

<sup>a</sup> (6a*R*,9*R*,10a*R*)-*N*-[3-(Dimethylamino)propyl]-7-(prop-2-enyl)-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxamide.

<sup>b</sup> (6a*R*,9*R*,10a*R*)-*N*<sup>9</sup>-[3-(Dimethylamino)propyl]-*N*<sup>4</sup>-ethyl-7-(prop-2-enyl)-6a,7,8,9,10,10a-hexahydroindolo[4,3-*fg*]quinoline-4,9(6*H*)-dicarboxamide.

<sup>c</sup> (6a*R*,9*R*,10a*R*)-7-(Prop-2-enyl)-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline-9-carboxylic acid.

<sup>d</sup> (6a*R*,9*R*,10a*R*)-*N*<sup>9</sup>-[3-(Dimethylamino)propyl]-*N*<sup>4</sup>-ethyl-*N*<sup>9</sup>-(ethyl-carbamoyl)-7-(prop-2-enyl)-6a,7,8,9,10,10a-hexahydroindolo[4,3-*fg*]quinoline-4,9(6*H*)-dicarboxamide.

**SPECIFIC TESTS**

- **OPTICAL ROTATION**, *Specific Rotation* (781S):  $-77^{\circ}$  to  $-83^{\circ}$   
*Sample solution*: 1 mg/mL in alcohol, on the anhydrous basis
- **WATER DETERMINATION**, *Method I* (921): NMT 0.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE**: Preserve in tight containers, protected from light.
- **USP REFERENCE STANDARDS** (11)  
 USP Cabergoline RS

**Cabergoline Tablets**

» Cabergoline Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cabergoline ( $C_{26}H_{37}N_5O_2$ ).

**Packaging and storage**—Preserve in light-resistant, tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—  
 USP Cabergoline RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium*: 0.1 N hydrochloric acid; 500 mL, degassed with helium.

*Apparatus 2*: 50 rpm.

*Time*: 15 minutes.

Determine the amount of  $C_{26}H_{37}N_5O_2$  dissolved by employing the following procedure.

*Mobile phase and Chromatographic system*—Prepare as directed in the *Assay*.

*Standard solution*—Dissolve an accurately weighed quantity of USP Cabergoline RS in *Medium* to obtain a solution having a known concentration of about 1  $\mu$ g per mL.

*Test solution*—Pass the solution under test through a suitable filter, discarding the first few mL.

*Chromatographic system* (see *Chromatography* (621))—Prepare as directed in the *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 3000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2%.

*Procedure*—Separately inject equal volumes (about 100  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of  $C_{26}H_{37}N_5O_2$  dissolved by the formula:

$$\frac{r_U \times C_S \times 500 \times 100}{r_S \times L}$$

in which  $r_U$  and  $r_S$  are the responses for the cabergoline peak obtained from the *Test solution* and the *Standard solution*, respectively;  $C_S$  is the concentration of USP Cabergoline RS, in mg per mL, in the *Standard solution*; 500 is the volume of *Medium*; and  $L$  is the Tablet label claim, in mg per Tablet.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{26}H_{37}N_5O_2$  is dissolved in 15 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Chromatographic purity**—[NOTE—Prepare solutions immediately before use, and protect from light.]

*Mobile phase*—Prepare as directed in the *Assay*.

*Resolution solution*—To 10 mL of 0.1 M sodium hydroxide add 50 mg of cabergoline. Stir for about 15 minutes. To 1 mL of the suspension add 1 mL of 0.1 M hydrochloric acid, and dilute with *Mobile phase* to 10 mL. Sonicate until dissolution is complete. The main degradation product obtained is cabergoline related compound A.

*Test solution*—Use the *Assay preparation*, prepared as directed in the *Assay*.

*Chromatographic system* (see *Chromatography* (621))—Prepare as directed in the *Assay*. Chromatograph (about 20  $\mu$ L) of the *Resolution solution*, and record the peak responses as directed for *Procedure*. Identify the peaks due to cabergoline related compound A and cabergoline using the relative retention times (RRT) given in *Table 1*: the resolution,  $R$ , between cabergoline and cabergoline related compound A is not less than 3.0.

*Procedure*—Inject a volume (about 100  $\mu$ L) of the *Test solution* into the chromatograph, and record the chromatogram. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak area of each impurity obtained from the *Test solution*; and  $r_s$  is the sum of the peak areas of all the impurities and the main peak due to cabergoline obtained from the *Test solution*. Calculate the percentage of total impurities in the portion of Tablets taken by the formula:

$$100(r_t / r_s)$$

in which  $r_t$  is the sum of the peak areas of all the impurities obtained from the *Test solution*; and  $r_s$  is the sum of the peak areas of all the impurities and the main peak due to cabergoline obtained from the *Test solution*. The relative retention times and limits for cabergoline related compounds A and cabergoline N-oxide are given in *Table 1*.

**Table 1**

Name	RRT	Limit (%)
Cabergoline related compound A <sup>1</sup>	0.8	NMT 2.0
Cabergoline	1.0	—
Cabergoline N-oxide <sup>2</sup>	1.4	NMT 1.0
Any unspecified degradation product	—	NMT 0.5
Total	—	NMT 2.5

<sup>1</sup>(6aR,9R,10aR)-7-(Prop-2-enyl)-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinoline-9-carboxylic acid.

<sup>2</sup>(6aR,9R,10aR)-7-Allyl-N-(3-(dimethylazino)propyl)-N-(ethylcarbamoyl)-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-fg]quinoline-9-carboxamide.

**Assay**—[NOTE—Prepare solutions immediately before use, and protect from light.]

*Buffer*—Transfer 6.8 g of monobasic potassium phosphate to a 1-L volumetric flask. Dissolve the contents in 900 mL of water. Adjust with phosphoric acid to a pH of 2.0. Dilute with water to volume, add 0.2 mL of triethylamine, and mix well.

*Mobile phase*—Prepare a mixture of *Buffer* and acetonitrile (84:16), and degas. Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Cabergoline RS in *Mobile phase* to obtain a solution having a known concentration of about 0.25 mg per mL. [NOTE—Sonication may be used to aid in the dissolution of cabergoline.]

*Assay preparation*—Grind not fewer than 20 Tablets into a fine powder. Transfer an accurately weighed portion of the

powder, equivalent to about 2.5 mg of cabergoline based on the label claim, to a 10-mL volumetric flask. Dilute with *Mobile phase* to volume, and sonicate until completely dissolved. This solution has a nominal concentration of about 0.25 mg per mL of cabergoline, based on the label claim. [NOTE—The *Assay preparation* may be passed through a PVDF type filter with a pore size of 0.45 µm prior to analysis.]

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4.0-mm × 25-cm column that contains 10-µm packing L1. The flow rate is about 1.3 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 1000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of the label claim of C<sub>26</sub>H<sub>37</sub>N<sub>5</sub>O<sub>2</sub> in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration of USP Cabergoline RS, in mg per mL, in the *Standard preparation*;  $C_U$  is the nominal concentration of cabergoline, in mg per mL, in the *Assay preparation*, based on the label claim; and  $r_U$  and  $r_S$  are the peak responses for cabergoline obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Caffeine

C <sub>8</sub> H <sub>10</sub> N <sub>4</sub> O <sub>2</sub> · H <sub>2</sub> O	212.21
C <sub>8</sub> H <sub>10</sub> N <sub>4</sub> O <sub>2</sub>	194.19
1 <i>H</i> -Purine-2,6-dione, 3,7-dihydro-1,3,7-trimethyl-; 1,3,7-Trimethylxanthine [58-08-2].	
Monohydrate [5743-12-4].	

### DEFINITION

Caffeine is anhydrous or contains one molecule of water of hydration. It contains NLT 98.5% and NMT 101.0% of C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>, calculated on the anhydrous basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197M>
- **B.** The retention time of the caffeine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 0.82 g/L of anhydrous sodium acetate

**Mobile phase:** Acetonitrile, tetrahydrofuran, and *Buffer* (25:20:955). Adjust with glacial acetic acid to a pH of 4.5.

**System suitability solution:** 0.02 mg/mL of theophylline in *Mobile phase*. Shake, and sonicate if necessary, to dissolve.

**Standard solution:** Transfer 5.0 mg of USP Caffeine RS to a 25-mL volumetric flask. Add 5.0 mL of the *System suitability solution* and 10 mL of *Mobile phase*. Shake, and sonicate if necessary. Dilute with *Mobile phase* to volume, and filter.

**Sample solution:** 0.2 mg/mL of Caffeine in *Mobile phase*. [NOTE—Shake, and sonicate if necessary, to dissolve.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 275 nm

**Column:** 4.6-mm × 15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for theophylline and caffeine are 0.69 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 6.0 between theophylline and caffeine

**Tailing factor:** NMT 2.0 for theophylline and caffeine peaks

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>) in the portion of Caffeine taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response of caffeine from the *Sample solution*

$r_S$  = peak response of caffeine from the *Standard solution*

$C_S$  = concentration of USP Caffeine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Caffeine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.5%–101.0% on the anhydrous basis

### IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **HEAVY METALS, Method II** <231>: NMT 10 ppm
- **ORGANIC IMPURITIES**

**Mobile phase, Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Caffeine taken:

$$\text{Result} = (r_U / r_T) \times 100$$

$r_U$  = peak response for each impurity from the *Sample solution*

$r_T$  = sum of the responses of all the peaks from the *Sample solution*

#### Acceptance criteria

**Individual impurities:** NMT 0.1%

**Total impurities:** NMT 0.1%

### SPECIFIC TESTS

- **WATER DETERMINATION, Method III** <921>: Dry a sample at 80° for 4 h: the anhydrous form loses NMT 0.5% of its weight, and the hydrous form loses NMT 8.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve hydrous Caffeine in tight containers. Preserve anhydrous Caffeine in well-closed containers.
- **LABELING:** Label it to indicate whether it is anhydrous or hydrous.
- **USP REFERENCE STANDARDS** <11>  
USP Caffeine RS

**Caffeine Citrate Injection**

» Caffeine Citrate Injection is a sterile solution containing Caffeine and citric acid in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of caffeine citrate ( $C_{14}H_{18}N_4O_9$ ). It contains no bacteriostat or other preservative.

**Packaging and storage**—Preserve in single-dose, tight containers of Type I glass, and store at a temperature between 15° and 30°.

**USP Reference standards** <11>—

USP Caffeine RS  
USP Endotoxin RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** It meets the requirements of the test for *Citrate* (191).

**C:** Transfer about 4 g of potassium iodide to a 100-mL volumetric flask. Add 10 mL of water, and shake until the potassium iodide is dissolved. Transfer 2 g of iodine to the volumetric flask, and shake until dissolved. Dilute with water to volume, and mix. Transfer 5 drops of the solution so obtained to a 25-mL centrifuge tube containing 5.0 mL of the Injection, and mix. Add 0.5 mL of 2.0 M hydrochloric acid solution, and mix: a brown precipitate that dissolves on neutralization with 0.5 mL of sodium hydroxide TS is produced.

**Color and clarity**—Transfer a suitable portion of the Injection to a clear glass test tube, and visually examine the solution in a well-lighted area: the solution is colorless and free of haze, obvious turbidity, and precipitate.

**Bacterial endotoxins** (85): not more than 0.25 USP Endotoxin Unit per mg of caffeine.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 4.2 and 5.2.

**Particulate matter** (788): not more than 150 particles are equal to or greater than 10  $\mu$ m, and not more than 25 particles are equal to or greater than 25  $\mu$ m.

**Related compounds**—

*Mobile phase* and *Theophylline solution*—Proceed as directed in the *Assay*.

*Standard solution*—Use the *Standard preparation*, prepared as directed in the *Assay*.

*System sensitivity solution*—Transfer 2.5 mL of the *Standard solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Test solution*—Use the *Assay preparation*, prepared as directed in the *Assay*.

*Chromatographic system* (see *Chromatography* <621>)—Proceed as directed in the *Assay*. Chromatograph the *System sensitivity solution*, and record the peak responses as directed

for *Procedure*: the theophylline peak produces a discernible peak response at its retention time.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of any related compound in the portion of Injection taken by the formula:

$$100F(386.31/194.19)(C_s / C_w)(r_i / r_s)$$

in which *F* is the relative response factor and is equal to 0.878 for theobromine at a relative retention time of about 0.4, equal to 1.10 for paraxanthine at a relative retention time of about 0.6, equal to 0.905 for theophylline at a relative retention time of about 0.7, and equal to 1.0 for any other related compound; 386.31 and 194.19 are the molecular weights of caffeine citrate and caffeine, respectively; *C<sub>s</sub>* is the concentration, in mg per mL, of USP Caffeine RS in the *Standard solution*; *C<sub>w</sub>* is the caffeine citrate concentration, in mg per mL, in the *Test solution*, as obtained in the *Assay*; *r<sub>i</sub>* is the individual peak response for each related compound obtained from the *Test solution*; and *r<sub>s</sub>* is the caffeine peak response obtained from the *Standard solution*: not more than 0.10% of any individual related compound is found; and not more than 0.1% of total impurities is found.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—

*Mobile phase*—Prepare a mixture of 0.01 M sodium acetate, acetonitrile, and tetrahydrofuran (191:5:4). Adjust with glacial acetic acid to a pH of 4.5, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Theophylline solution*—Dissolve an accurately weighed quantity of theophylline in water, and dilute quantitatively, and stepwise if necessary, with water, to obtain a solution having a concentration of about 0.02 mg per mL.

*Standard preparation*—Transfer about 5 mg of USP Caffeine RS, accurately weighed, to a 25-mL volumetric flask. Add 5 mL of *Theophylline solution*, dissolve in and dilute with water to volume, and mix.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of caffeine, to a 250-mL volumetric flask. Dilute with water to volume, mix, and pass through a polyvinylidene difluoride or equivalent membrane having a 0.45- $\mu$ m porosity.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm  $\times$  150-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for theophylline and 1.0 for caffeine; the resolution, *R<sub>s</sub>*, between theophylline and caffeine is not less than 6.0; the tailing factor, determined from the theophylline and caffeine peaks, is not more than 2.0; and the relative standard deviation for replicate injections, determined from the caffeine peaks, is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the caffeine peak responses. Calculate the quantity, in mg, of caffeine citrate ( $C_{14}H_{18}N_4O_9$ ) in the volume of Injection taken by the formula:

$$250(386.31/194.19)C(r_u / r_s)$$

in which 386.31 and 194.19 are the molecular weights of caffeine citrate and caffeine, respectively; *C* is the concentration, in mg per mL, of USP Caffeine RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Caffeine Citrate Oral Solution

» Caffeine Citrate Oral Solution is a sterile aqueous solution containing Caffeine and citric acid. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of caffeine citrate ( $C_{14}H_{18}N_4O_9$ ). It contains no bacteriostat or other preservative.

**Packaging and storage**—Preserve in single-dose, tight containers, and store at a temperature between 15° and 30°.

**USP Reference standards** (11)—  
USP Caffeine RS

### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** It meets the requirements of the test for *Citrate* (191).

**C:** Transfer about 4 g of potassium iodide to a 100-mL volumetric flask. Add 10 mL of water, and shake until the potassium iodide is dissolved. Transfer 2 g of iodine to the volumetric flask, and shake until dissolved. Dilute with water to volume, and mix. Transfer 5 drops of the solution so obtained to a 25-mL centrifuge tube containing 5.0 mL of the Oral Solution, and mix. Add 0.5 mL of 2.0 M hydrochloric acid solution, and mix: a brown precipitate is produced that dissolves on neutralization with 0.5 mL of sodium hydroxide TS.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 4.2 and 5.2.

### Related compounds—

*Mobile phase* and *Theophylline solution*—Proceed as directed in the *Assay*.

*Standard solution*—Use the *Standard preparation*, prepared as directed in the *Assay*.

*System sensitivity solution*—Transfer 2.5 mL of the *Standard solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Test solution*—Use the *Assay preparation*, prepared as directed in the *Assay*.

*Chromatographic system* (see *Chromatography* (621))—Proceed as directed in the *Assay*. Chromatograph the *System sensitivity solution*, and record the peak responses as directed for *Procedure*: the theophylline peak produces a discernible peak response at its retention time.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of any related compound in the portion of Oral Solution taken by the formula:

$$100F(386.31/194.19)(C_S / C_W)(r_i / r_S)$$

in which *F* is the relative response factor and is equal to 0.878 for theobromine at a relative retention time of about 0.4, equal to 1.10 for paraxanthine at a relative retention time of about 0.6, equal to 0.905 for theophylline at a relative retention time of about 0.7, and equal to 1.0 for any other related compound; 386.31 and 194.19 are the molecular weights of caffeine citrate and caffeine, respectively; *C<sub>S</sub>* is the concentration, in mg per mL, of USP Caffeine RS in the *Standard solution*; *C<sub>W</sub>* is the caffeine citrate concentration, in mg per mL, in the *Test solution*, as obtained in the *Assay*; *r<sub>i</sub>* is the individual peak response for each related

compound obtained from the *Test solution*; and *r<sub>S</sub>* is the caffeine peak response obtained from the *Standard solution*: not more than 0.10% of any individual related compound is found; and not more than 0.1% of total impurities is found.

### Assay—

*Mobile phase*—Prepare a mixture of 0.01 M sodium acetate, acetonitrile, and tetrahydrofuran (191:5:4). Adjust with glacial acetic acid to a pH of 4.5, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Theophylline solution*—Dissolve an accurately weighed quantity of theophylline in water, and dilute quantitatively, and stepwise if necessary, with water, to obtain a solution having a concentration of about 0.02 mg per mL.

*Standard preparation*—Transfer about 5 mg of USP Caffeine RS, accurately weighed, to a 25-mL volumetric flask. Add 5 mL of the *Theophylline solution*, dissolve in and dilute with water to volume, and mix.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 50 mg of caffeine, to a 250-mL volumetric flask. Dilute with water to volume, mix, and pass through a polyvinylidene difluoride or equivalent membrane having a 0.45- $\mu$ m porosity.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm  $\times$  150-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for theophylline and 1.0 for caffeine; the resolution, *R*, between theophylline and caffeine is not less than 6.0; the tailing factor, determined from the theophylline and caffeine peaks, is not more than 2.0; and the relative standard deviation for replicate injections, determined from the caffeine peaks, is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the caffeine peak responses. Calculate the quantity, in mg, of caffeine citrate ( $C_{14}H_{18}N_4O_9$ ) in the volume of Oral Solution taken by the formula:

$$250(386.31/194.19)C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Caffeine RS in the *Standard preparation*; 386.31 and 194.19 are the molecular weights of caffeine citrate and caffeine, respectively; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Caffeine and Sodium Benzoate Injection

» Caffeine and Sodium Benzoate Injection is a sterile solution containing equal amounts of Caffeine and Sodium Benzoate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of anhydrous caffeine ( $C_8H_{10}N_4O_2$ ) and sodium benzoate ( $C_7H_5NaO_2$ ).

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Caffeine RS  
USP Endotoxin RS

**Identification—**

**A:** The caffeine obtained in the *Assay for caffeine* herein responds to *Identification* test A under *Caffeine*.

**B:** Dip the end of a platinum wire into a portion of Injection, and then introduce it into a nonluminous flame: the flame is colored intensely yellow.

**C:** To about 0.5 mL of Injection add a few drops of ferric chloride TS: a salmon-colored precipitate is formed. To another portion of Injection add 3 N hydrochloric acid: a white precipitate is formed.

**Bacterial endotoxins** (85)—It contains not more than 0.7 USP Endotoxin Unit per mg of caffeine and sodium benzoate, based on the total, in mg, of the labeled amounts.

**pH** (791): between 6.5 and 8.5.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for caffeine**—Measure accurately a volume of Injection, equivalent to about 250 mg each of caffeine and sodium benzoate, transfer it completely with the aid of about 5 mL of water to a small separator, add 1 drop of phenolphthalein TS, and add 0.1 N sodium hydroxide, dropwise, until a permanent pink color is just produced. Shake the mixture with three or more 20-mL portions of chloroform to effect complete extraction of the caffeine, passing each chloroform extract through a small filter previously moistened with chloroform into a tared dish. (Retain the water layer for the *Assay for sodium benzoate*.) Wash the stem of the separator, the filter, and the funnel with 10 mL of hot chloroform, adding the washings to the dish. Evaporate the combined chloroform solutions on a steam bath, adding 2 mL of alcohol just before the last trace of chloroform is expelled. Complete the evaporation of the solvent, dry the residue, consisting of  $C_8H_{10}N_4O_2$ , at 80° for 4 hours, cool, and weigh.

**Assay for sodium benzoate**—To the water layer obtained in the *Assay for caffeine* add 75 mL of ether and 5 drops of methyl orange TS. Titrate with 0.1 N hydrochloric acid VS, mixing the liquids by vigorous shaking, until a permanent pink color is produced in the water layer. Each mL of 0.1 N hydrochloric acid is equivalent to 14.41 mg of  $C_7H_5NaO_2$ .

**Calamine**

Iron oxide ( $Fe_2O_3$ ), mixture with zinc oxide.  
Calamine (pharmaceutical preparation) [8011-96-9].

» Calamine is Zinc Oxide with a small proportion of ferric oxide, and contains, after ignition, not less than 98.0 percent and not more than 100.5 percent of zinc oxide ( $ZnO$ ).

**Packaging and storage**—Preserve in well-closed containers.

**Identification—**

**A:** Treat 1 g with 10 mL of 3 N hydrochloric acid, and filter: the filtrate responds to the tests for *Zinc* (191).

**B:** Treat 1 g with 10 mL of 3 N hydrochloric acid, heat to boiling, and filter: the filtrate assumes a reddish color upon the addition of ammonium thiocyanate TS.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Loss on ignition** (733)—Weigh accurately about 2 g, and ignite at 500° to constant weight: it loses not more than 2.0% of its weight.

**Acid-insoluble substances**—Dissolve 2.0 g in 50 mL of 3 N hydrochloric acid. If an insoluble residue remains, collect it on a tared filter, wash with water, dry at 105° for 1 hour, cool, and weigh: the weight of the residue does not exceed 40 mg (2.0%).

**Alkaline substances**—Digest 1.0 g with 20 mL of water on a steam bath for 15 minutes, filter, and add 2 drops of phenolphthalein TS: if a red color is produced, not more than 0.20 mL of 0.10 N sulfuric acid is required to discharge it.

**Arsenic, Method I** (211): 8 ppm.

**Calcium**—Digest 1 g in 25 mL of 3 N hydrochloric acid for 30 minutes, filter to remove the insoluble ferric oxide, and add 6 N ammonium hydroxide to the filtrate until the precipitate first formed is redissolved, then add 5 mL more of 6 N ammonium hydroxide. To 10 mL of this solution add 2 mL of ammonium oxalate TS: not more than a slight turbidity is produced.

**Calcium or magnesium**—To another 10-mL portion of the solution prepared for the test for *Calcium* add 2 mL of dibasic sodium phosphate TS: not more than a slight turbidity is produced.

**Lead**—To 1 g add 15 mL of water, stir, then add 3 mL of glacial acetic acid, and warm on a steam bath until dissolved. Filter, and add 5 drops of potassium chromate TS: no turbidity is produced.

**Assay**—Digest about 1.5 g of freshly ignited Calamine, accurately weighed, with 50.0 mL of 1 N sulfuric acid VS, applying gentle heat until no further solution occurs. Filter the mixture, and wash the residue on the filter with hot water until the last washing is neutral to litmus paper. To the combined filtrate and washings add 2.5 g of ammonium chloride, cool, add methyl orange TS, and titrate with 1 N sodium hydroxide VS. Each mL of 1 N sulfuric acid is equivalent to 40.69 mg of  $ZnO$ .

**Calamine Topical Suspension**

» Prepare Calamine Topical Suspension as follows.

Calamine . . . . .	80 g
Zinc Oxide . . . . .	80 g
Glycerin . . . . .	20 mL
Bentonite Magma . . . . .	250 mL
Calcium Hydroxide Topical Solution, a sufficient quantity to make . . . .	1000 mL

Dilute the Bentonite Magma with an equal volume of Calcium Hydroxide Topical Solution. Mix the powders intimately with the Glycerin and about 100 mL of the diluted magma, triturating until a smooth, uniform paste is formed. Gradually incorporate the remainder of the diluted magma. Finally add enough Calcium Hydroxide Topical Solution to make 1000 mL, and shake.

If a more viscous consistency in the Calamine Topical Suspension is desired, the quantity of Bentonite Magma may be increased to not more than 400 mL.

NOTE—Shake the Calamine Topical Suspension before dispensing.

**Packaging and storage**—Preserve in tight containers.

**Microbial enumeration tests** (61) **and Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

## Phenolated Calamine Topical Suspension

» Prepare Phenolated Calamine Topical Suspension as follows:

Liquefied Phenol . . . . .	10 mL
Calamine Topical Suspension . . . .	990 mL
To make . . . . .	1000 mL

Mix the ingredients.

NOTE—Shake Phenolated Calamine Topical Suspension before dispensing.

**Packaging and storage**—Preserve in tight containers.

## Calcifediol

$C_{27}H_{44}O_2 \cdot H_2O$  418.65

9,10-Secosterolesta-5,7,10(19)-triene-3,25-diol monohydrate, (3 $\beta$ ,5Z,7E)-.

25-Hydroxycholecalciferol monohydrate [63283-36-3].

» Calcifediol contains not less than 97.0 percent and not more than 103.0 percent of  $C_{27}H_{44}O_2 \cdot H_2O$ .

**Packaging and storage**—Preserve in tight, light-resistant containers at controlled room temperature.

**USP Reference standards** (11)—

USP Calcifediol RS

**Identification, Infrared Absorption** (197M).

**Water, Method Ia** (921): between 3.8% and 5.0%, determined on a 0.2-g specimen.

**Assay**—

**Internal standard solution**—Dissolve testosterone in ethyl acetate to obtain a solution having a concentration of about 0.10 mg per mL.

**Mobile phase**—Prepare a suitable degassed solution of about 6 volumes of heptane, 6 volumes of water-saturated

heptane, 3 volumes of methylene chloride, and 5 volumes of ethyl acetate.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Calcifediol RS in *Internal standard solution*, and dilute quantitatively and stepwise with *Internal standard solution* to obtain a solution having a known concentration of about 20  $\mu$ g per mL.

**Assay preparation**—Transfer about 10 mg of Calcifediol, accurately weighed, to a 50-mL volumetric flask, dissolve in *Internal standard solution*, dilute with *Internal standard solution* to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 4-mm  $\times$  30-cm column that contains packing L3, a detector that monitors absorption at 254 nm, and a pump capable of providing constant flow up to a minimum of 2000 psi.

**System suitability**—The relative standard deviation for peak response ratios for four replicate injections of *Standard preparation* is not more than 3.0%, and the resolution factor is not less than 3.0.

**Procedure**—Introduce equal volumes of the *Standard preparation* and the *Assay preparation* into the chromatograph (see *Chromatography* (621)), and measure the peak responses obtained. Calculate the quantity, in mg, of  $C_{27}H_{44}O_2 \cdot H_2O$  in the portion of Calcifediol taken by the formula:

$$0.5C(R_U / R_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Calcifediol RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of calcifediol to testosterone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Calcifediol Capsules

» Calcifediol Capsules contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{27}H_{44}O_2 \cdot H_2O$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Calcifediol RS

**Identification**—Transfer the contents of a number of Capsules, equivalent to about 150  $\mu$ g of calcifediol, to a suitable container, add 1 mL of methanol, and shake vigorously for 1 minute. Separate the layers by centrifugation, and transfer as much of the top, methanol layer as possible to a second container. Evaporate this extract to dryness, and dissolve the residue in about 1 mL of chloroform. Proceed as directed under *Thin-layer Chromatographic Identification Test* (201), applying 20  $\mu$ L of this solution and 20  $\mu$ L of a solution containing about the same concentration of USP Calcifediol RS in chloroform, and using a solvent system consisting of 60 parts of cyclohexane and 40 parts of ethyl acetate.

**Dissolution** (711)—

**Medium:** water; 500 mL.

**Apparatus 2:** 50 rpm.

**Time:** 15 minutes.

**Procedure**—Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each capsule shell to rupture.

**Tolerances**—The requirements are met if all of the Capsules tested rupture in not more than 15 minutes. If 1 or 2 of the Capsules rupture in more than 15 but not more than 30 minutes, repeat the test on 12 additional Capsules. Not more than 2 of the total of 18 Capsules tested rupture in more than 15 but not more than 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**

**Internal standard solution**—Dissolve testosterone in ethyl acetate to obtain a solution having a concentration of about 35 µg per mL.

**Mobile phase**—Prepare as directed in the Assay under Calcifediol.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Calcifediol RS in *Internal standard solution*, and dilute quantitatively and stepwise with *Internal standard solution* to obtain a solution having a known concentration of about 7 µg of USP Calcifediol RS per mL.

**Assay preparation**—Transfer a number of Calcifediol Capsules to a suitable container. Using a suitable implement, shear open a number of Capsules inside the container. Wash the implement with an accurately measured volume of *Internal standard solution* that will yield a solution having a concentration of about 7 µg of calcifediol per mL. Collect the rinsings in the container, and mix to obtain a homogeneous solution of the Capsule contents.

**Chromatographic system and System suitability**—Proceed as directed in the Assay under Calcifediol.

**Procedure**—Proceed as directed for *Procedure* in the Assay under Calcifediol. Calculate the quantity, in µg, of C<sub>27</sub>H<sub>44</sub>O<sub>2</sub> · H<sub>2</sub>O in the portion of Capsule contents taken by the formula:

$$CV_U(R_U / R_S)$$

in which C is the concentration, in µg per mL, of USP Calcifediol RS in the *Standard preparation*; V<sub>U</sub> is the volume, in mL, of *Internal standard solution* taken for the Assay preparation; and R<sub>U</sub> and R<sub>S</sub> are the peak response ratios of calcifediol to testosterone obtained from the Assay preparation and the *Standard preparation*, respectively.

**Calcitonin Salmon**

CSNLSCTCVLG KLSQELHLKLO TYPRNTGSG TP —NH<sub>2</sub>

C<sub>145</sub>H<sub>240</sub>N<sub>44</sub>O<sub>48</sub>S<sub>2</sub> 3432 daltons  
[47931-85-1].

**DEFINITION**

Calcitonin Salmon is a polypeptide that has the same sequence as that of the hormone that regulates calcium metabolism and is secreted by the ultimobranchial gland of salmon. It is produced from either synthetic processes or microbial processes using recombinant DNA (rDNA) technology. The host cell-derived protein content and the host cell- or vector-derived DNA content of Calcitonin Salmon produced from an rDNA process are determined by validated methods. It contains NLT 90.0% and NMT 105.0% of calcitonin salmon, calculated on an acetic acid-free and anhydrous basis. [NOTE—1 mg of acetic acid-free, anhydrous Calcitonin Salmon is equivalent to 6000 USP Calcitonin Salmon Units. 1 USP Calcitonin Salmon Unit = 1 Calcitonin IU.]

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, obtained as directed in the Assay.

**ASSAY**

**Change to read:**

• **PROCEDURE**

**Solution A:** Dissolve 3.26 g of tetramethylammonium hydroxide pentahydrate in 900 mL of water, and adjust with phosphoric acid to a pH of 2.5. Add 100 mL of acetonitrile, and mix.

**Solution B:** Dissolve 1.45 g of tetramethylammonium hydroxide pentahydrate in 400 mL of water, and adjust with phosphoric acid to a pH of 2.5. Add 600 mL of acetonitrile, and mix.

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	72	28
30	48	52
32	72	28
55	72	28

**Standard solution:** 1.0 mg/mL of USP Calcitonin Salmon RS in *Solution A*

**System suitability solution:** • Prepare a solution in *Solution A* containing about 0.2 mg/mL of USP Calcitonin Salmon Related Compound A RS and 0.2 mg/mL of USP Calcitonin Salmon RS. • (RB 1-Apr-2012)

**Sample solution:** 1.0 mg/mL of Calcitonin Salmon in *Solution A*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Column temperature:** 65°

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times for calcitonin salmon and calcitonin salmon related compound A are 1.0 and 1.15, respectively.]

**Suitability requirements**

**Resolution:** NLT 3 between calcitonin salmon and calcitonin salmon related compound A

**Tailing factor:** NMT 2.5 for calcitonin salmon

**Relative standard deviation:** NMT 3%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of calcitonin salmon (C<sub>145</sub>H<sub>240</sub>N<sub>44</sub>O<sub>48</sub>S<sub>2</sub>) in the portion of Calcitonin Salmon taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r<sub>U</sub> = peak response of calcitonin salmon from the *Sample solution*

r<sub>S</sub> = peak response of calcitonin salmon from the *Standard solution*

C<sub>S</sub> = concentration of USP Calcitonin Salmon RS in the *Standard solution* (corrected for water and acetic acid content) (mg/mL)

C<sub>U</sub> = concentration of the *Sample solution* (corrected for water and acetic acid content) (mg/mL)

**Acceptance criteria:** 90.0%–105.0% on an acetic acid-free and anhydrous basis

## OTHER COMPONENTS

### • ACETIC ACID CONTENT (503)

**Sample solution:** 1 mg/mL of Calcitonin Salmon in *Diluent*, prepared as directed in the chapter

**Acceptance criteria:** 4%–15%

## IMPURITIES

### • HEAVY METALS, *Method II* (231): NMT 50 µg/g

### Change to read:

### • PROCEDURE: RELATED PEPTIDES AND OTHER RELATED SUBSTANCES

#### Test 1

[NOTE—This test is performed on material produced by both chemical synthesis processes and rDNA processes.]

**Solution A, Solution B, Mobile phase, System suitability solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Calcitonin Salmon taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak area response of each impurity from the *Sample solution*

$r_T$  = sum of the area responses of all the peaks from the *Sample solution*

#### Acceptance criteria

**Individual impurities:** NMT 3.0% of the total area of all peaks

**Total impurities:** NMT 5.0% of the sum of the areas of all the peaks including the principal peak

[NOTE—Disregard any peaks due to the solvent and any peaks whose area is less than 0.1% of the principal peak.]

#### Test 2

[NOTE—This test needs to be performed only on material produced using rDNA technology.]

**Buffer A:** Dissolve 2.72 g of monobasic potassium phosphate in 1000 mL of water.

**Buffer B:** Dissolve 2.72 g of monobasic potassium phosphate and 29.2 g of sodium chloride in 1000 mL of water.

**Buffer C (pH 3.0 citrate buffer):** Dissolve 4.8 g of citric acid in 80 mL of water. Adjust with 1 M sodium hydroxide to a pH of 3.0, and dilute with water to 100.0 mL.

**Solution A:** Acetonitrile and *Buffer A* (15:85). Adjust with 45% (w/w) potassium hydroxide to a pH of 5.0.

**Solution B:** Acetonitrile and *Buffer B* (15:85). Adjust with 45% (w/w) potassium hydroxide to a pH of 4.6.

**Mobile phase:** See *Table 2*.

**Table 2**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
10	0	100
15	0	100
15.1	100	0
22.1	100	0

• **Resolution solution:** Prepare a solution in water containing about 0.5 mg/mL each of USP Calcitonin

Salmon RS and USP Calcitonin Salmon Related Compound B RS. To 1 mL of this solution add 100 µL of pH 3.0 citrate buffer. • (RB 1-Apr-2012)

**Sample solution:** To 1 mL of a 0.5-mg/mL solution of Calcitonin Salmon add 100 mL of *Buffer C*.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 20-cm; packing L9

**Flow rate:** 1.2 mL/min

**Injection volume:** 50 µL

### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for [1,7-bis(3-sulfo-L-alanine)] calcitonin salmon-glycine, [1,7-bis(3-sulfo-L-alanine)] calcitonin salmon, and calcitonin salmon related compound B (calcitonin salmon-glycine) are 0.4, 0.6, and 0.9, respectively; and the retention time for calcitonin salmon is about 9 min.]

### Suitability requirements

**Resolution:** NLT 3.0 between calcitonin salmon and calcitonin salmon related compound B

### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Calcitonin Salmon taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response for each impurity

$r_T$  = sum of the responses of all the peaks

### Acceptance criteria

**Individual impurities:** See *Table 3*.

**Table 3**

Name	Relative Retention Time	Acceptance Criteria NMT (%)
[1,7-Bis(3-sulfo-L-alanine)] calcitonin salmon-glycine	0.4	0.2
[1,7-Bis(3-sulfo-L-alanine)] calcitonin salmon	0.6	0.2
Calcitonin salmon related compound B	0.9	0.6

## SPECIFIC TESTS

### • AMINO ACID PROFILE

(See *Biotechnology-Derived Articles—Amino Acid Analysis* (1052).)

[NOTE—This test needs to be performed only on material of synthetic origin. The concentration of amino acids in the *Internal standard solution*, *Standard stock solution*, and *Standard solution* and the amount of material used to prepare the *Sample solution* can be adjusted depending on the method used for amino acid analysis. The concentrations given are based on analysis using *Method 1*.]

**Internal standard solution:** 1 mM solution of γ-aminobutyric acid

**Standard stock solution:** Prepare a mixture containing equimolar amounts of ammonia and the L form of lysine, histidine, arginine, aspartic acid, threonine, serine, proline, valine, glutamic acid, glycine, leucine, and tyrosine, together with half the equimolar amount of L-cysteine, in 0.1 M hydrochloric acid. The final concentration is about 2.5 mM for each amino acid.

**Standard solution:** Transfer 5 mL of the *Internal standard solution* and 2 mL of the *Standard stock solution* into a 50-mL volumetric flask, and dilute with 0.1 M hydrochloric acid to volume.

**Sample solution:** Place 1.5 mg of Calcitonin Salmon into a heavy-wall ignition tube. Add 1.0 mL of 6 N hydrochloric acid, and allow to cool. Immerse the lower half of the tube in a freezing mixture until the contents are frozen, then evacuate to approximately 10  $\mu$ m of Hg, purge with nitrogen (repeat the evacuation and nitrogen purge three times), and seal the tube while it is under a 10  $\mu$ m of Hg vacuum. Heat for 16 h at 110°–115° in an air oven. Cool, open the tube, dry in a vacuum desiccator, remove the contents, and allow to cool to room temperature. Dissolve in 0.1 M hydrochloric acid. Transfer to a 10-mL volumetric flask, add 1 mL of *Internal standard solution*, and dilute with 0.1 M hydrochloric acid to volume.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Standardize the amino acid analyzer using the *Standard solution*. Inject the *Sample solution* into the amino acid analyzer, and determine the relative proportion of amino acids.

Express the content of each amino acid in moles using an internal standard calibration technique. Calculate the relative proportions of the amino acids by taking as equivalent to one the sum of the number of moles of aspartic acid, glutamic acid, proline, glycine, valine, leucine, histidine, arginine, and lysine divided by 20.

**Acceptance criteria:** The requirements are met if the values fall within the limits in *Table 4*.

**Table 4**

Name	Acceptance Criteria
Aspartic acid	1.8–2.2
Glutamic acid	2.7–3.3
Proline	1.7–2.3
Glycine	2.7–3.3
Valine	0.9–1.1
Leucine	4.5–5.3
Histidine	0.9–1.1
Arginine	0.9–1.1
Lysine	1.8–2.2
Serine	3.2–4.2
Threonine	4.2–5.2
Tyrosine	0.7–1.1
Half cystine	1.4–2.1

#### • PEPTIDE MAPPING

(See *Biotechnology-Derived Articles—Peptide Mapping* (1055).)

[NOTE—This test needs to be performed only on material produced using rDNA technology.]

**Solution A:** Water and trifluoroacetic acid (1000:1)

**Solution B:** Acetonitrile, water, and trifluoroacetic acid (800:200:0.85)

**Mobile phase:** See *Table 5*.

**Table 5**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
50	65	35
60	40	60
60.1	0	100
65.1	0	100
65.2	100	0
80.2	100	0

**Trypsin solution:** Freshly prepare a solution containing 0.1 mg/mL of trypsin (previously treated with L-1-tosyl-amido-2-phenylethyl chloromethyl ketone [TPCK] to remove chymotrypsin activity) in water.

**Tris buffer:** 1 M tris(hydroxymethyl) aminomethane and 10 mM calcium chloride. Adjust with hydrochloric acid to a pH of 8.0.

**Stopping solution:** Water and trifluoroacetic acid (1:1)

**Standard solution:** Prepare a 1.0-mg/mL solution of USP Calcitonin Salmon RS. Transfer 1 mL of this solution to a clean vial. Add 100  $\mu$ L of *Tris buffer* and 50  $\mu$ L of *Trypsin solution*. Mix, and incubate at 2°–8° for 16–20 h. Quench the digestion by adding 10  $\mu$ L of *Stopping solution*.

**Sample solution:** 1.0 mg/mL of Calcitonin Salmon. Transfer 1 mL of this solution to a clean vial. Add 100  $\mu$ L of *Tris buffer* and 50  $\mu$ L of *Trypsin solution*. Mix, and incubate at 2°–8° for 16–20 h. Quench the digestion by adding 10  $\mu$ L of *Stopping solution*.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Flow rate:** 1.2 mL/min

**Injection volume:** 20  $\mu$ L

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—Condition the chromatographic system by running a blank gradient program before injecting the digests.]

**Acceptance criteria:** The chromatographic profile of the *Sample solution* is similar to that of the *Standard solution*.

#### • BIOIDENTITY

**RPMI 1640 with L-glutamine:** Prepare a mixture of the ingredients in the quantities shown in *Table 6* in sufficient water to obtain 1 L of *RPMI 1640 with L-glutamine* solution, and sterilize by filtration.

**Table 6**

Calcium nitrate	100.00 mg
Potassium chloride	400.00 mg
Magnesium sulfate, anhydrous	48.84 mg
Potassium chloride	400 mg
Sodium chloride	6000 mg
Sodium phosphate, dibasic, anhydrous	800 mg
Sodium bicarbonate	2000 mg
Glucose	2000 mg
Glycine	10 mg
L-Arginine	200 mg
L-Asparagine	50 mg
L-Aspartic acid	20 mg
L-Cystine dihydrochloride	65 mg
L-Glutamic acid	20 mg
L-Glutamine	300 mg
L-Histidine	15 mg

**Table 6** (Continued)

L-Hydroxyproline	20 mg
L-Isoleucine	50 mg
L-Leucine	50 mg
L-Lysine hydrochloride	40 mg
L-Methionine	15 mg
L-Phenylalanine	15 mg
L-Proline	20 mg
L-Serine	30 mg
L-Threonine	20 mg
L-Tryptophan	5 mg
L-Tyrosine disodium salt dihydrate	29 mg
L-Valine	20 mg
Biotin	0.2 mg
Choline chloride	3 mg
D-Calcium pantothenate	0.25 mg
Folic acid	1 mg
<i>D</i> -Inositol	35 mg
Niacinamide	1 mg
<i>para</i> -Aminobenzoic acid	1 mg
Pyridoxine hydrochloride	1 mg
Riboflavin	0.2 mg
Thiamine hydrochloride	1 mg
Vitamin B <sub>12</sub>	0.005 mg

**Medium A** (growth medium): Using aseptic technique prepare the following tissue culture medium.

**Table 7**

RPMI 1640 with L-glutamine	500 mL
Fetal bovine serum	50 mL
1 M HEPES	5 mL
Penicillin/streptomycin solution (10,000 IU/mL per 10 mg/mL)	5 mL
Human insulin	10 IU
Hydrocortisone	0.5 mg

**Medium B** (stimulation medium): Dissolve 5 g of bovine serum albumin (BSA) in 500 mL of 2 mM RPMI 1640 with L-glutamine.

**Solution A** (0.2% BSA solution): Dissolve 50 mg of BSA in 25 mL of water. [NOTE—Use within one day.]

**Solution B** (formic acid/BSA solution): Add 25 mL of 0.1 M formic acid and 5 mL of Solution A to a 50-mL volumetric flask, dilute with water to volume, and mix. [NOTE—Use within two days.]

**Solution C** (trypsin/EDTA solution): Prepare a sterile filtered solution containing 0.25% trypsin and 0.53 mM EDTA (tetrasodium ethylenediaminetetraacetate).

**Solution D** (Dulbecco's phosphate buffered saline): Dissolve 8 g of sodium chloride, 1.15 g of dibasic sodium phosphate, 0.2 g of monobasic potassium phosphate, 0.2 g of potassium chloride, 0.1 g of calcium chloride, and 0.1 g of magnesium chloride in 1 L of water.

**Standard stock solution:** 20 µg/mL of USP Calcitonin Salmon RS in Solution B

**Positive control solution:** Quantitatively dilute the Standard stock solution in Medium B to obtain a 1-ng/mL solution of USP Calcitonin Salmon RS.

**Negative control solution:** Medium B

[NOTE—Prior analysis should be performed to identify the linear portion of the dose-response curve. For example, the Standard solutions and Sample solutions given below.]

**Standard solution A:** 0.8 ng/mL of USP Calcitonin Salmon RS from the Standard stock solution in Medium B

**Standard solution B:** 0.4 ng/mL of USP Calcitonin

Salmon RS from Standard solution A in Medium B

**Standard solution C:** 0.2 ng/mL of USP Calcitonin

Salmon RS from Standard solution B in Medium B

**Standard solution D:** 0.1 ng/mL of USP Calcitonin

Salmon RS from Standard solution C in Medium B

**Sample stock solution:** 20 µg/mL of Calcitonin Salmon in Solution B

**Sample solution A:** 0.8 ng/mL of Calcitonin Salmon from the Sample stock solution in Medium B

**Sample solution B:** 0.4 ng/mL of Calcitonin Salmon from Sample solution A in Medium B

**Sample solution C:** 0.2 ng/mL of Calcitonin Salmon from Sample solution B in Medium B

**Sample solution D:** 0.1 ng/mL of Calcitonin Salmon from Sample solution C in Medium B

**Cell culture preparation:** Prepare a cell culture of the human mammary tumor cell line T-47D. Cells are propagated using Medium A at 37° and 5% carbon dioxide. The medium is changed every two days, and cells are passaged every 5–9 days using Solution C with a 1:4 subculture.

**Cell suspension:** For the test use a cell culture that is 5–9 days old. Remove the cell culture medium from the flask by aspiration, add 10 mL of Solution D, and rock the culture flask to rinse the entire monolayer. Remove the liquid by aspiration, add 2 mL of Solution C, spread over the entire monolayer, allow to stand for 3–5 min, and add 10 mL of Medium A. Homogenize the cell suspension using a pipet, transfer to a 15-mL polypropylene tube, centrifuge at about  $220 \times g$  for 5 min, pour off the supernatant, and resuspend the cell pellet in 10 mL of Medium A. Count the cells, and adjust the cell density through dilution using Medium A to  $2.5 \times 10^4$  cells/mL.

**Procedure:** Place 200 µL of the Cell suspension into each well of a 96-well culture plate (the tissue culture plate), and incubate for 18–24 h at 37° and 5% carbon dioxide. Fill each well of an empty, round-bottomed, 96-well culture plate (the prepared plate) with 150 µL of one of the following solutions: Positive control solution, Negative control solution, Standard solutions A–D, and Sample solutions A–D, so that each solution fills at least five wells on the prepared plate. After incubation remove the culture medium from the tissue culture plate. Using an 8-channel or 12-channel pipet, rapidly transfer 100 µL of solution from each well of the prepared plate to each well of the tissue culture plate. Incubate for 15 min at ambient temperature, remove the solution from each well, stop stimulation by immediately adding an appropriate cell-lysis buffer, and quantitate cAMP produced within the cells, using a validated kit. Perform the test three times, using three different 96-well culture plates. [NOTE—Some kits include a cell-lysis reagent and a sequestering agent for the cell-lysis reagent. The range of the test kit is between 0.05 and 10 ng/mL of cAMP. The number of cells used in the assay may vary, depending on the validated kit used to quantitate cAMP.]

**Analysis:** Potency is determined by a 3-dose, 6-point parallel-line assay, using standard statistical methods. The calculation is carried out using both the lower three concentrations and the upper three concentrations. For the assay to be valid, the requirements for regression, parallelism, and difference of quadratics must be met. If the requirements for validity are met to the same extent in both assessments (the lower and the higher assessments) the final result is determined from the concentration range that shows the higher value when the common slope is divided by the root mean square error.

**Acceptance criteria:** Combine the three potency values by using an unweighted mean on the log scale. Deter-

mine a 95% confidence interval in the log scale using standard statistical methods. Convert the average and confidence interval to the potency scale using antilogs to obtain a geometric mean and its confidence interval. The potency levels determined from all three performances of the test are valid if the data analysis indicates the three determinations to be homogeneous, and the confidence interval is fully contained within 64% and 156% of the geometric mean. If the confidence interval requirement is not met, additional assays may be performed to increase the number of assays and make the confidence interval narrower. The determination of whether it meets the identity requirement should be done only after the confidence interval requirement is met. The acceptance criterion for identity is that the geometric mean is within 80% and 125% of the Assay value.

## Calcitonin Salmon Injection

### DEFINITION

Calcitonin Salmon Injection is a sterile solution of Calcitonin Salmon in a suitable diluent. Each mL of Calcitonin Salmon Injection possesses an activity of NLT 80% and NMT 120% of that stated on the label.

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### PROCEDURE

**Solution A:** Dissolve 3.26 g of tetramethylammonium hydroxide pentahydrate in 900 mL of water, add 100 mL of acetonitrile, and mix. Adjust with phosphoric acid to a pH of 2.5, pass through a filter of 0.5- $\mu$ m or finer pore size, and degas.

**Solution B:** Dissolve 1.45 g of tetramethylammonium hydroxide pentahydrate in 400 mL of water, add 600 mL of acetonitrile, and mix. Adjust with phosphoric

acid to a pH of 2.5, pass through a filter of 0.5- $\mu$ m or finer pore size, and degas.

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	72	28
30	48	52
32	72	28
55	72	28

**Standard stock solution:** 1.0 mg/mL of USP Calcitonin Salmon RS in *Solution A*

**Standard solution:** 0.1 mg/mL of USP Calcitonin Salmon RS from *Standard stock solution* diluted with *Solution A*

**System suitability solution:** Dissolve the contents of a vial of USP Calcitonin Salmon Related Compound A RS in 0.4 mL of *Solution A*, add 0.1 mL of the *Standard solution*, and mix. Take 0.1 mL of this solution, add 0.9 mL of *Solution A*, and mix.

**Sample solution:** Use the solution from an undiluted Injection vial.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Column temperature:** 65°

**Flow rate:** 1 mL/min

**Injection size:** 200  $\mu$ L

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for calcitonin salmon and calcitonin salmon related compound A are 1.0 and 1.15, respectively.]

#### Suitability requirements

**Resolution:** NLT 3 between calcitonin salmon and calcitonin salmon related compound A

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 3%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the potency, in USP Calcitonin Salmon Units/mL, in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times C_S$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Calcitonin Salmon RS in the *Standard solution* (USP Calcitonin Salmon Units/mL)

**Acceptance criteria:** 80%–120%

### SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST** (85): NMT 0.625 USP Endotoxin Unit/USP Calcitonin Salmon Unit
- **STERILITY TESTS** (71): Meets the requirements when tested as directed in the *Test for Sterility of the Product to Be Examined, Membrane Filtration*
- **PARTICULATE MATTER IN INJECTIONS** (788): Meets the requirements for small-volume injections
- **pH** (791): 3.9–4.5
- **INJECTIONS** (1): Meets the requirements

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass. Avoid freezing. Store in a refrigerator.
- **LABELING:** Label it to indicate the activity in USP Calcitonin Salmon Units/mL. The labeling states that the material is synthetic. Label it to state that it is to be

stored in a refrigerator, and that freezing is to be avoided.

## Calcitonin Salmon Nasal Solution

### DEFINITION

Calcitonin Salmon Nasal Solution is a solution of Calcitonin Salmon in a suitable diluent. It contains suitable preservatives, and is packaged in a form suitable for nasal administration so that the required dosage can be controlled as required. Each mL of Calcitonin Salmon Nasal Solution possesses an activity of NLT 80% and NMT 115% of that stated on the label.

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

• **PROCEDURE**

**Solution A:** 3.26 mg/mL of tetramethylammonium hydroxide pentahydrate in water and acetonitrile (9:1). Adjust with phosphoric acid to a pH of 2.5.

**Solution B:** 1.45 mg/mL of tetramethylammonium hydroxide pentahydrate in acetonitrile and water (3:2). Adjust with phosphoric acid to a pH of 2.5.

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	72	28
30	48	52
32	72	28
55	72	28

**Diluent:** 7.5 mg/mL of sodium chloride, 2 mg/mL of sodium acetate, and 2 mg/mL of glacial acetic acid in water

**Standard stock solution:** 1.0 mg/mL of USP Calcitonin Salmon RS in *Solution A*

**Standard solution:** 0.1 mg/mL of USP Calcitonin Salmon RS from the *Standard stock solution* in *Solution A*

**System suitability stock solution:** Dissolve the contents of a vial of USP Calcitonin Salmon Related Compound A RS in 0.4 mL of *Solution A*, and add 0.1 mL of the *Standard solution*.

**System suitability solution:** *System suitability stock solution* and *Solution A* (1:9)

**Sample solution:** Nasal Solution in *Diluent* (1:9)

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Column temperature:** 65°

**Flow rate:** 1 mL/min

**Injection size:** 200 µL

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for calcitonin salmon and calcitonin salmon related compound A are 1.0 and 1.15, respectively.]

**Suitability requirements**

**Resolution:** NLT 3 between calcitonin salmon and calcitonin salmon related compound A

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 3.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of Calcitonin Salmon in the portion of Nasal Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of the *Sample solution*

$r_S$  = peak area of the *Standard solution*

$C_S$  = concentration of USP Calcitonin Salmon RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of calcitonin salmon in the *Sample solution* (mg/mL)

**Acceptance criteria:** 80%–115%

### SPECIFIC TESTS

- MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total aerobic microbial count is NMT 100 cfu/g, and the total combined molds and yeasts count is NMT 50 cfu/g. It meets the requirements for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

- PH** <791>: 3.5–4.5

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in containers suitable for spraying the contents into the nasal cavities in a controlled individualized dosage. Store unopened containers in a refrigerator and opened containers at room temperature.
- LABELING:** Label it to indicate that it is for intranasal administration only. The labeling also states that it has been prepared either with Calcitonin Salmon of synthetic origin or Calcitonin Salmon of rDNA origin. Label it to state that it is to be stored in a refrigerator, and that freezing is to be avoided. Label it to indicate the activity in USP Calcitonin Salmon Units per mL.
- USP REFERENCE STANDARDS** <11>  
USP Calcitonin Salmon RS

N-Acetyl-cys<sup>1</sup>-calcitonin.  
C<sub>146</sub>H<sub>243</sub>N<sub>44</sub>O<sub>49</sub>S<sub>2</sub> 3463

## Calcitriol

C<sub>27</sub>H<sub>44</sub>O<sub>3</sub> 416.64

9,10-Secocholesta-5,7,10(19)-triene-1,3,25-triol, (1 $\alpha$ ,3B,5Z,7E)-.

(5Z,7E)-9,10-Secocholesta-5,7,10(19)-triene-1 $\alpha$ ,3B,25-triol [32222-06-3].

Monohydrate 434.65 [77326-95-5].

» Calcitriol is anhydrous or contains one molecule of hydration. The anhydrous form contains not less than 97.0 percent and not more than 103.0 percent of C<sub>27</sub>H<sub>44</sub>O<sub>3</sub>, calculated on the solvent-free basis. The monohydrate form contains not less than 97.0 percent and not more than

103.0 percent of C<sub>27</sub>H<sub>44</sub>O<sub>3</sub>, calculated on the anhydrous basis.

**Caution**—Care should be taken to prevent inhaling particles of calcitriol and exposing the skin to it.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store as per labeling instructions.

**Labeling**—Where it is a monohydrate form, the label so indicates.

**USP Reference standards** (11)—  
USP Calcitriol RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water**, *Method 1c* (921)(where it is labeled as a monohydrate): between 3.5% and 5.5%.

**Chromatographic purity**—[NOTE—Carry out the procedure as rapidly as possible, avoiding unnecessary exposure of solutions to light and air.]

*Tris buffer solution*, *Mobile phase*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Test solution*—Prepare as directed for *Assay preparation*.

*Procedure*—Inject a volume (about 50 µL) of the *Test solution* into the chromatograph, record the chromatograms for at least two times the retention time of the calcitriol peak, identify the impurities listed in *Table 1*, and measure the peak responses. Calculate the percentage of any individual impurity in the portion of Calcitriol taken by the formula:

$$100(r_i / r_s)$$

in which *r<sub>i</sub>* is the peak response of any individual peak other than the main calcitriol peak and the pre-calcitriol peak; and *r<sub>s</sub>* is the sum of the responses of all the peaks: in addition to not exceeding the limits in *Table 1*, not more than 1.0% of total impurities is found. Disregard any peak less than 0.1%.

Table 1

Name	Relative Retention Time	Limit (%)
Triazoline adduct of pre-calcitriol	0.43	0.1
trans-Calcitriol <sup>1</sup>	0.96	0.25
1β-Calcitriol <sup>2</sup>	1.15	0.1
Methylene calcitriol <sup>3</sup>	1.5	0.25
Any other individual unidentified impurity	—	0.1

<sup>1</sup>(5E,7E)-9,10-secocholesta-5,7,10(19)-triene-1α,3β,25-triol

<sup>2</sup>(5Z,7E)-9,10-secocholesta-5,7,10(19)-triene-1β,3β,25-triol

<sup>3</sup>(5Z,7E)-1α,3β-dihydroxy-17-((R)-7-hydroxy-7-methyloctan-2-yl)-9,10-secoandrosta-5,7,10(19)-triene

**Assay**—[NOTE—Carry out the procedure as rapidly as possible, avoiding unnecessary exposure of solutions to light and air.]

*Tris buffer solution*—Dissolve 1.0 g of tris(hydroxymethyl)aminomethane in 900 mL of water, adjust with phosphoric acid to a pH of 7.0 to 7.5, dilute with water to make 1000 mL, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and *Tris buffer solution* (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Transfer an accurately weighed quantity of USP Calcitriol RS to a suitable volumetric flask, dissolve first in acetonitrile (without heating), using 55% of the final volume, then dilute with *Tris buffer solution* to volume, and mix to obtain a solution having a known concentration of about 100 µg of calcitriol per mL. [NOTE—Allow the solution to warm up to room temperature before diluting with *Tris buffer solution* to final volume.]

*System suitability solution*—Heat 2.0 mL of the *Standard preparation* at 80° for 30 minutes.

*Assay preparation*—Transfer an accurately weighed quantity of Calcitriol to a suitable volumetric flask, dissolve first in acetonitrile (without heating), using 55% of the final volume, then dilute with *Tris buffer solution* to volume, and mix to obtain a solution having a known concentration of about 100 µg of calcitriol per mL. [NOTE—Allow the solution to warm up to room temperature before diluting with *Tris buffer solution* to final volume.]

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for pre-calcitriol and 1.0 for calcitriol; and the resolution, *R*, between pre-calcitriol and calcitriol is not less than 3.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 10,000 theoretical plates; and the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the calcitriol and pre-calcitriol peaks. Calculate the percentage of C<sub>27</sub>H<sub>44</sub>O<sub>3</sub> in the portion of Calcitriol taken by the formula:

$$100(C_s / C_u)(r_u / r_s)$$

in which *C<sub>s</sub>* and *C<sub>u</sub>* are the concentrations, in µg per mL, of calcitriol in the *Standard preparation* and the *Assay preparation*, respectively; and *r<sub>u</sub>* and *r<sub>s</sub>* are the sums of the calcitriol and pre-calcitriol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Calcitriol Injection

» Calcitriol Injection is a sterile solution of Calcitriol. It contains an amount of Calcitriol equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of calcitriol (C<sub>27</sub>H<sub>44</sub>O<sub>3</sub>). It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light. Store at controlled room temperature.

**USP Reference standards** (11)—

USP Calcitriol Solution RS

USP Endotoxin RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 100 USP Endotoxin Units per µg of calcitriol.

**pH** (791): between 5.9 and 8.0, determined on a portion to which, if necessary, 0.30 mL of saturated potassium chloride solution has been added for each 100 mL of Injection.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—[NOTE—Avoid unnecessary exposure of solutions to light or air.]

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (74:26). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)) so that the retention time for calcitriol is not less than 20 minutes.

**Standard preparation**—Transfer 3.0 mL of USP Calcitriol Solution RS, equilibrated to room temperature, to a container; add 3.0 mL of water; and mix.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 3 µg of calcitriol, to a container; add a sufficient amount of water to dilute to a total volume of 3.0 mL; add 3.0 mL of methanol; and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 264-nm detector, a 4.6-mm × 4.5-cm guard column that contains 5-µm packing L1, and a 4.6-mm × 7.5-cm analytical column that contains 3-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of calcitriol (C<sub>27</sub>H<sub>44</sub>O<sub>3</sub>) in each mL of the Injection taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of calcitriol in the USP Calcitriol Solution RS; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Calcium Acetate

C<sub>4</sub>H<sub>6</sub>CaO<sub>4</sub> 158.17  
Acetic acid, calcium salt;  
Calcium acetate [62-54-4].

### DEFINITION

Calcium Acetate contains NLT 99.0% and NMT 100.5% of C<sub>4</sub>H<sub>6</sub>CaO<sub>4</sub>, calculated on the anhydrous basis.

### IDENTIFICATION

- A. IDENTIFICATION TESTS—GENERAL**, *Calcium* (191) and *Acetate* (191)  
**Sample solution**: 50 mg/mL  
**Acceptance criteria**: Meets the requirements

### ASSAY

#### PROCEDURE

**Sample**: 300 mg

**Analysis**: Dissolve the *Sample* in 150 mL of water containing 2 mL of 3 N hydrochloric acid. While stirring, preferably with a magnetic stirrer, add about 30 mL of 0.05 M edetate disodium VS from a 50-mL buret. Add

15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 7.909 mg of calcium acetate (C<sub>4</sub>H<sub>6</sub>CaO<sub>4</sub>).  
**Acceptance criteria**: 99.0%–100.5% on the anhydrous basis

### IMPURITIES

- ARSENIC**, *Method I* (211): NMT 3 ppm
- CHLORIDE AND SULFATE**, *Chloride* (221): A 1.0-g portion shows no more chloride than corresponds to 0.70 mL of 0.020 N hydrochloric acid (0.05%).
- CHLORIDE AND SULFATE**, *Sulfate* (221): A 0.25-g portion shows no more sulfate than corresponds to 0.15 mL of 0.020 N sulfuric acid (0.06%).
- HEAVY METALS**, *Method I* (231)  
**Test preparation**: Dissolve 0.8 g of Calcium Acetate in 20 mL of water. Add 3.0 mL of glacial acetic acid, dilute with water to 25 mL, and adjust with glacial acetic acid to a pH of 3.8–4.0, measured with a pH meter.  
**Monitor preparation**: Prepare as directed for the *Test preparation*, 2.0 mL of *Standard Lead Solution* being added.  
**Acceptance criteria**: NMT 25 ppm

- LEAD** (251): NMT 10 ppm

#### LIMIT OF ALUMINUM

[NOTE—Use where it is labeled as intended for parenteral use or for use in hemodialysis or peritoneal dialysis.]

**Buffer**: Dissolve 50 g of ammonium acetate in 150 mL of water, adjust with glacial acetic acid to a pH of 6.0, and dilute with water to 250 mL.

**Aluminum standard solution**: 1.0 µg/mL of aluminum. Prepare as directed for *Standard Preparations* under *Aluminum* (206).

**Standard solution**: Prepare a solution containing 2.0 mL of *Aluminum standard solution*, 5 mL of *Buffer*, and 48 mL of water, and extract this solution with successive portions of 10, 10, and 5 mL of 0.5% 8-hydroxyquinoline in chloroform. Combine the chloroform extracts in a 50-mL volumetric flask. Dilute the combined extracts with chloroform to volume.

**Sample solution**: Dissolve 1.0 g of Calcium Acetate in 50 mL of water, and add 5 mL of *Buffer*. Extract this solution with successive portions of 10, 10, and 5 mL of 0.5% 8-hydroxyquinoline in chloroform. Combine the chloroform extracts in a 50-mL volumetric flask. Dilute the combined extracts with chloroform to volume.

**Blank solution**: Prepare a solution containing 50 mL of water and 5 mL of *Buffer*. Extract this solution with successive portions of 10, 10, and 5 mL of 0.5% 8-hydroxyquinoline in chloroform. Combine the chloroform extracts in a 50-mL volumetric flask. Dilute the combined extracts with chloroform to volume.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode**: Fluorescence

**Excitation wavelength**: 392 nm

**Emission wavelength**: 518 nm

#### Analysis

**Samples**: *Standard solution*, *Sample solution*, and *Blank solution*. Use the *Blank solution* to zero the instrument.

**Acceptance criteria**: The fluorescence of the *Sample solution* is NMT that of the *Standard solution* (2 ppm).

#### LIMIT OF BARIUM

[NOTE—Use where it is labeled as intended for use in hemodialysis or peritoneal dialysis.]

**Barium chloride solution**: 500 µg/mL of barium in water, from anhydrous barium chloride

**Buffer**: Ammonium sulfate solution (1 in 10)

**Standard solution**: To a tube add 1 g of ammonium acetate, 2 mL of 1 N hydrochloric acid, 3.0 mL of *Barium chloride solution*, and sufficient water to bring the volume to 40 mL.

**Sample stock solution**: 250 mg/mL of Calcium Acetate and 25 mg/mL of ammonium acetate in 1 N hydrochloric

ric acid. The pH of this solution is 4.5–5.5. Filter and cover the solution.

**Sample solutions:** To four separate tubes add 1.0, 1.5, 2.0, and 2.5 mL of *Barium chloride solution*. To each tube add a sufficient volume of the *Sample stock solution* to bring the volume to 40 mL.

**Analysis:** To the *Sample solutions* and the *Standard solution* add, with brisk stirring, 3.0 mL of *Buffer*, and allow to stand for 20 min.

**Acceptance criteria:** The *Sample solutions* containing 1.0 and 1.5 mL of *Barium chloride solution* remain clear or are only faintly turbid. The *Sample solution* containing 2.0 mL of *Barium chloride solution* is not more turbid than the *Standard solution*.

#### • LIMIT OF FLUORIDE

[NOTE—Prepare and store all solutions in plastic containers.]

**Buffer:** 294 mg/mL of sodium citrate dihydrate in water  
**Standard stock solution:** 1.11 mg/mL of USP Sodium Fluoride RS, in water

**Standard solution:** Combine 20.0 mL of *Standard stock solution* with 50.0 mL of *Buffer*, and dilute with water to 100.0 mL. Equivalent to 100 µg/mL of fluoride.

**Sample solution:** Transfer 2.0 g of Calcium Acetate to a beaker containing a plastic-coated stirring bar. Add 20.0 mL of water and 2.0 mL of hydrochloric acid, and stir until dissolved. Add 50.0 mL of *Buffer* and sufficient water to make 100 mL.

**Electrode system:** Use a fluoride-specific ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of  $\pm 0.2$  mV (see pH <791>).

#### Analysis

**Samples:** *Standard response line* and *Sample solution*  
Transfer 50.0 mL of *Buffer* and 2.0 mL of hydrochloric acid to a beaker, and add water to make 100 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, stir for 15 min, and read the potential, in mV. Continue stirring, and at 5-min intervals add 100, 100, 300, and 500 µL of *Standard solution*, reading the potential 5 min after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1, 0.2, 0.5, and 1.0 µg/mL) versus potential, in mV.

Rinse and dry the electrodes, insert them into the *Sample solution*, stir for 5 min, and read the potential, in mV. From the measured potential and the *Standard response line* determine the concentration, *C*, in µg/mL, of fluoride ion in the *Sample solution*.

Calculate the amount of fluoride (ppm) in the sample taken by multiplying *C* by 50.

**Acceptance criteria:** 50 ppm

#### • LIMIT OF MAGNESIUM

[NOTE—Use where it is labeled as intended for use in hemodialysis or peritoneal dialysis. The *Standard solution* and the *Sample solutions* may be modified, if necessary, to obtain solutions of suitable concentrations, adaptable to the linear or working range of the instrument.]

**Standard stock solution:** 1000 µg/mL of magnesium in 1 N nitric acid, from magnesium oxide

**Standard solution:** 5.0 µg/mL of magnesium, from *Standard stock solution*

**Sample solution:** 2 mg/mL of Calcium Acetate

**Linearity solution A:** Dilute 20.0 mL of *Sample solution* with water to 25.0 mL (0 µg/mL of magnesium).

**Linearity solution B:** Dilute 2.0 mL of *Standard solution* and 20.0 mL of *Sample solution* with water to 25.0 mL (0.4 µg/mL of magnesium).

**Linearity solution C:** Dilute 4.0 mL of *Standard solution* and 20.0 mL of *Sample solution* with water to 25.0 mL (0.8 µg/mL of magnesium).

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Atomic absorption spectroscopy

**Analytical wavelength:** 285.2 nm

**Flame:** Air–acetylene

**Lamp:** Magnesium hollow-cathode

**Blank:** Water

#### Analysis

**Samples:** *Linearity solutions A, B, and C*

Plot the absorbances of the *Linearity solutions* versus their content (0, 0.4, and 0.8 µg/mL) of magnesium, draw the straight line best fitting the three points, and extrapolate the line until it intercepts the concentration axis. From the intercept determine the amount, in µg/mL, of magnesium in the *Sample solution*.

Calculate the percentage of magnesium in the sample by multiplying this value by 0.0625.

**Acceptance criteria:** NMT 0.05%

#### • LIMIT OF NITRATE

**Sample solution:** 100 mg/mL of Calcium Acetate in water

**Analysis:** To 10 mL of the *Sample solution* add 5 mg of sodium chloride, 0.05 mL of indigo carmine TS, and, with stirring, 10 mL of nitrogen-free sulfuric acid.

**Acceptance criteria:** The blue color persists for NLT 10 min.

#### • LIMIT OF POTASSIUM

[NOTE—Use where it is labeled as intended for use in hemodialysis or peritoneal dialysis. The *Standard solution* and the *Sample solutions* may be modified, if necessary, to obtain solutions of suitable concentrations, adaptable to the linear or working range of the instrument.]

**Standard stock solution:** 23.84 mg/mL of potassium chloride, using potassium chloride previously dried at 105° for 2 h, equivalent to 12.5 mg/mL of potassium

**Standard solution:** 31.25 µg/mL of potassium, from *Standard stock solution*

**Sample solution:** 12.5 mg/mL of calcium acetate

**Linearity solution A:** Dilute 20.0 mL of *Sample solution* with water to 25.0 mL (0 µg/mL of potassium).

**Linearity solution B:** Dilute 2.0 mL of *Standard solution* and 20.0 mL of *Sample solution* with water to 25.0 mL (2.5 µg/mL of potassium).

**Linearity solution C:** Dilute 4.0 mL of *Standard solution* and 20.0 mL of *Sample solution* with water to 25.0 mL (5.0 µg/mL of potassium).

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Atomic absorption spectroscopy

**Analytical wavelength:** 766.7 nm

**Lamp:** Potassium hollow-cathode

**Flame:** Air–acetylene

**Blank:** Water

#### Analysis

**Samples:** *Linearity solutions A, B, and C*

Plot the absorbances of the *Linearity solutions* versus their content (0, 2.5, and 5.0 µg/mL) of potassium, draw the straight line best fitting the three points, and extrapolate the line until it intercepts the concentration axis. From the intercept determine the amount, in µg/mL, of potassium in the *Sample solution*.

Calculate the percentage of potassium in the sample by multiplying this value by 0.01.

**Acceptance criteria:** NMT 0.05%

#### • LIMIT OF SODIUM

[NOTE—Use where it is labeled as intended for use in hemodialysis or peritoneal dialysis. The *Standard solution* and the *Sample solutions* may be modified, if necessary, to obtain solutions of suitable concentrations, adaptable to the linear or working range of the instrument.]

**Standard stock solution:** 25.42 mg/mL of sodium chloride, using sodium chloride previously dried at 105° for 2 h, equivalent to 10.0 mg/mL of sodium

**Standard solution:** 250 µg/mL of sodium, from *Standard stock solution*

**Sample solution:** 10 mg/mL of Calcium Acetate

**Linearity solution A:** Dilute 20.0 mL of *Sample solution* with water to 25.0 mL (0 µg/mL of sodium).

**Linearity solution B:** Dilute 2.0 mL of *Standard solution* and 20.0 mL of *Sample solution* with water to 25.0 mL (20 µg/mL of sodium).

**Linearity solution C:** Dilute 4.0 mL of *Standard solution* and 20.0 mL of *Sample solution* with water to 25.0 mL (40 µg/mL of sodium).

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectroscopy

**Analytical wavelength:** 589.0 nm

**Lamp:** Sodium hollow-cathode

**Flame:** Air-acetylene

**Blank:** Water

#### Analysis

**Samples:** *Linearity solutions A, B, and C*

Plot the absorbances of the *Linearity solutions* versus their content (0, 20, and 40 µg/mL) of sodium, draw the straight line best fitting the three points, and extrapolate the line until it intercepts the concentration axis. From the intercept determine the amount, in µg/mL, of sodium in the *Sample solution*.

Calculate the percentage of sodium in the sample by multiplying this value by 0.0125.

**Acceptance criteria:** NMT 0.5%

#### • LIMIT OF STRONTIUM

[NOTE—Use where it is labeled as intended for use in hemodialysis or peritoneal dialysis. The *Standard solution* and the *Sample solutions* may be modified, if necessary, to obtain solutions of suitable concentrations, adaptable to the linear or working range of the instrument.]

**Standard stock solution:** 2.45 mg/mL of strontium acetate in water, equivalent to 1000 µg/mL of strontium

**Standard solution:** 50.0 µg/mL of strontium, from *Standard stock solution*

**Sample solution:** 20 mg/mL of Calcium Acetate

**Linearity solution A:** Dilute 20.0 mL of *Sample solution* with water to 25.0 mL (0 µg/mL of strontium).

**Linearity solution B:** Dilute 2.0 mL of *Standard solution* and 20.0 mL of *Sample solution* with water to 25.0 mL (4 µg/mL of strontium).

**Linearity solution C:** Dilute 4.0 mL of *Standard solution* and 20.0 mL of *Sample solution* with water to 25.0 mL (8 µg/mL of strontium).

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectroscopy

**Analytical wavelength:** 460.7 nm

**Lamp:** Strontium hollow-cathode

**Flame:** Nitrous oxide-acetylene

**Blank:** Water

#### Analysis

**Samples:** *Linearity solutions A, B, and C*

Plot the absorbances of the *Linearity solutions* versus their content (0, 4, and 8 µg/mL) of strontium, draw the straight line best fitting the three points, and extrapolate the line until it intercepts the concentration axis. From the intercept determine the amount, in µg/mL, of strontium in the *Sample solution*.

Calculate the percentage of strontium in the sample by multiplying this value by 0.00625.

**Acceptance criteria:** NMT 0.05%

#### • READILY OXIDIZABLE SUBSTANCES

**Sample solution:** 20 mg/mL of Calcium Acetate in boiling water

**Analysis:** Add a few glass beads to 100 mL of the *Sample solution*, 6 mL of 10 N sulfuric acid, and 0.3 mL of 1 N potassium permanganate. Mix, boil gently for 5 min, and allow the precipitate to settle.

**Acceptance criteria:** The pink color in the supernatant is not completely discharged.

#### SPECIFIC TESTS

##### • pH (791)

**Sample solution:** 50 mg/mL

**Acceptance criteria:** 6.3–9.6

##### • WATER DETERMINATION, Method I (921)

**Sample:** 0.7 g

**Analysis:** Proceed as directed in the chapter, adding 20.0 mL of glacial acetic acid to the titration vessel in addition to the methanol.

**Acceptance criteria:** NMT 7.0%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **LABELING:** Where Calcium Acetate is intended for use in hemodialysis or peritoneal dialysis, it is so labeled.

• **USP REFERENCE STANDARDS (11)**

USP Sodium Fluoride RS

## Calcium Acetate Tablets

#### DEFINITION

Calcium Acetate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of calcium acetate ( $\text{C}_4\text{H}_6\text{CaO}_4$ ).

#### IDENTIFICATION

• **IDENTIFICATION TESTS—GENERAL,** *Calcium* (191) and *Acetate* (191)

**Sample solution:** 100 mg/mL of calcium acetate from powdered Tablets

**Acceptance criteria:** Meet the requirements

#### ASSAY

##### • PROCEDURE

**Sample:** Amount equivalent to 300 mg of calcium acetate from NLT 20 powdered Tablets

**Analysis:** Dissolve the *Sample* in 150 mL of water containing 2 mL of 3 N hydrochloric acid. While stirring, add 30 mL of 0.05 M edetate disodium VS from a 50-mL buret, and add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue. Continue the titration with the 0.05 M edetate disodium VS to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 7.909 mg of calcium acetate ( $\text{C}_4\text{H}_6\text{CaO}_4$ ).

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION (711)

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

##### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrometry

**Analytical wavelength:** 422.8 nm

**Standard solution:** Calcium at a known concentration in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary, to a concentration that is similar to the *Standard solution*.

**Acceptance criteria:** NLT 80% (Q) of the labeled amount of calcium acetate ( $\text{C}_4\text{H}_6\text{CaO}_4$ ) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

**IMPURITIES****• LIMIT OF ALUMINUM**

**Buffer:** Dissolve 50 g of ammonium acetate in 150 mL of water, adjust with glacial acetic acid to a pH of 6.0, and dilute with water to 250 mL.

**Aluminum standard solution** 1.0 µg/mL of aluminum. Prepare as directed for *Standard Preparation* under *Aluminum* <206>.

**Standard solution:** Prepare a solution containing 2.0 mL of *Aluminum standard solution*, 5 mL of *Buffer*, and 48 mL of water, and extract this solution with successive portions of 10, 10, and 5 mL of 0.5% 8-hydroxyquinoline in chloroform. Combine the chloroform extracts in a 50-mL volumetric flask, and dilute the combined extracts with chloroform to volume.

**Sample solution:** Dissolve a portion of powdered Tablets (NLT 10) equivalent to 1.0 g of calcium acetate in 50 mL of water, and add 5 mL of *Buffer*. Extract this solution with successive portions of 10, 10, and 5 mL of 0.5% 8-hydroxyquinoline in chloroform. Combine the chloroform extracts in a 50-mL volumetric flask, and dilute the combined extracts with chloroform to volume.

**Blank solution:** Prepare a solution containing 50 mL of water and 5 mL of *Buffer*. Extract this solution with successive portions of 10, 10, and 5 mL of 0.5% 8-hydroxyquinoline in chloroform. Combine the chloroform extracts in a 50-mL volumetric flask, and dilute the combined extracts with chloroform to volume.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Fluorescence

**Excitation wavelength:** 392 nm

**Emission wavelength:** 518 nm

**Analysis**

**Samples:** *Standard solution*, *Sample solution*, and *Blank solution*. Use the *Blank solution* to zero the instrument.

**Acceptance criteria:** The fluorescence of the *Sample solution* does not exceed that of the *Standard solution* (NMT 2 ppm).

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

**Calcium Ascorbate**

426.34

**DEFINITION**

Calcium Ascorbate contains NLT 98.0% and NMT 101.0% of calcium ascorbate dihydrate ( $\text{C}_{12}\text{H}_{14}\text{CaO}_{12} \cdot 2\text{H}_2\text{O}$ ), calculated on the as-is basis.

**IDENTIFICATION**

- **A. IDENTIFICATION TESTS—GENERAL,** *Calcium* <191>: A 100 mg/mL solution meets the requirements.
- **B.** A 100 mg/mL solution decolorizes a 100 mg/mL solution of dichlorophenol-indophenol.
- **C. INFRARED ABSORPTION** <197M>

**ASSAY****• PROCEDURE**

**Sample:** 300 mg of Calcium Ascorbate

**Blank:** 50 mL of water

**Titrimetric system**

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.1 N iodine VS

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* into a 250-mL conical flask, add 50 mL of water, and mix to dissolve. Immediately titrate with the *Titrant*, adding 3 mL of starch TS

as the endpoint is approached. Perform a *Blank* determination.

Calculate the percentage of calcium ascorbate dihydrate ( $\text{C}_{12}\text{H}_{14}\text{CaO}_{12} \cdot 2\text{H}_2\text{O}$ ) in the *Sample* taken:

$$\text{Result} = \{(V_S - V_B) \times N \times F / W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = *Titrant* normality (mEq/mL)

$F$  = equivalency factor, 106.6 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 98.0%–101.0% on the as-is basis

**IMPURITIES**

- **ARSENIC, Method I** <211>: NMT 3 µg/g

- **HEAVY METALS, Method II** <231>: NMT 10 ppm

**• LIMIT OF FLUORIDE**

[NOTE—Prepare and store all solutions in plastic containers.]

**Buffer solution:** 294 mg/mL of sodium citrate dihydrate in water

**Standard stock solution:** 1.1052 mg/mL of USP Sodium Fluoride RS in water

**Standard solution:** Transfer 20.0 mL of *Standard stock solution* to a 100-mL volumetric flask containing 50.0 mL of *Buffer solution*, dilute with water to volume, and mix. Each mL of *Standard solution* contains 100 µg of fluoride ion.

**Sample solution:** Transfer 2.0 g of Calcium Ascorbate to a beaker containing a plastic-coated stirring bar. Add 20 mL of water and 2.0 mL of hydrochloric acid, and stir until dissolved. Add 50.0 mL of *Buffer solution* and sufficient water to make 100 mL.

**Electrode system:** Use a fluoride-specific ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of  $\pm 0.2$  mV (see pH <791>).

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Standard response line:** Transfer 50.0 mL of *Buffer solution* and 2.0 mL of hydrochloric acid to a beaker, and add water to make 100 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, stir for 15 min, and read the potential, in mV. Continue stirring, and at 5-min intervals add 100, 100, 300, and 500 µL of *Standard solution*, reading the potential 5 min after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1, 0.2, 0.5, and 1.0 µg/mL) versus potential, in mV.

Rinse and dry the electrodes, insert them into the *Sample solution*, stir for 5 min, and read the potential, in mV. From the measured potential and the *Standard response line* determine the concentration,  $C$  (in µg/mL), of fluoride ion in the *Sample solution*.

Calculate the content of fluoride in the portion of Calcium Ascorbate taken:

$$\text{Result} = (C \times V) / W$$

$C$  = concentration of fluoride ion in the *Sample solution* (µg/mL), obtained from the *Standard response line*

$V$  = volume of the *Sample solution* (mL)

$W$  = weight of Calcium Ascorbate taken to prepare the *Sample solution* (g)

**Acceptance criteria:** NMT 10 ppm

**SPECIFIC TESTS**

- **OPTICAL ROTATION, Specific Rotation** <781S>

**Sample solution:** 50 mg/mL in carbon dioxide-free water [NOTE—Perform measurements immediately after preparation.]

- Acceptance criteria: +95° to +97°
- **PH** <791>  
Sample solution: 100 mg/mL  
Acceptance criteria: 6.8–7.4
- **LOSS ON DRYING** <731>: Dry 3 g at 105° for 2 h: it loses NMT 0.1% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** <11>  
USP Calcium Ascorbate RS  
USP Sodium Fluoride RS

---

**Calcium Carbonate**

---

CaCO<sub>3</sub> 100.09  
Carbonic acid, calcium salt (1:1);  
Calcium carbonate (1:1) [471-34-1].

**DEFINITION**

Calcium Carbonate, dried at 200° for 4 h, contains calcium equivalent to NLT 98.0% and NMT 100.5% of calcium carbonate (CaCO<sub>3</sub>).

**IDENTIFICATION**

- **A. IDENTIFICATION TESTS—GENERAL, Calcium** <191>: The addition of acetic acid to it produces effervescence (presence of carbonate), and the resulting solution, after boiling, meets the requirements of the tests.

**ASSAY**

- **TITRIMETRY** <541>  
Sample: 200 mg of Calcium Carbonate, previously dried at 200° for 4 h  
Blank: 100 mL of water and 15 mL of 1 N sodium hydroxide  
Titrimetric system  
(See *Titrimetry* <541>.)  
Mode: Direct titration  
Titrant: 0.05 M edetate disodium VS  
Indicator: 300 mg of hydroxy naphthol blue  
Endpoint detection: Visual, change to distinct blue  
Analysis: Transfer the *Sample* to a 250-mL beaker. Moisten thoroughly with a few mL of water, and add, dropwise, sufficient 3 N hydrochloric acid to dissolve. Add 100 mL of water, 15 mL of 1 N sodium hydroxide, and 300 mg of hydroxy naphthol blue. Titrate with the *Titrant*. Calculate the percentage of calcium carbonate (CaCO<sub>3</sub>) in the *Sample* taken:

$$\text{Result} = [(V - B) \times M \times F \times 100] / W$$

*V* = *Sample* titrant volume (mL)  
*B* = *Blank* titrant volume (mL)  
*M* = titrant molarity (mmol/mL)  
*F* = equivalency factor, 100.09 mg/mmol  
*W* = weight of the *Sample* (mg)

Acceptance criteria: 98.0%–100.5% on the dried basis

**IMPURITIES**• **ACID-INSOLUBLE SUBSTANCES**

Sample: 5.0 g  
Analysis: Mix the *Sample* with 10 mL of water, and add hydrochloric acid, dropwise, with agitation, until it ceases to cause effervescence, then add water to make the mixture measure 200 mL, and filter. Wash the insoluble residue with water until the last washing shows no chloride, and ignite and weigh the residue.  
Acceptance criteria: NMT 0.2%; the weight of the residue does not exceed 10 mg.

• **ARSENIC, Method I** <211>

Sample solution: Slowly dissolve 1.0 g in 15 mL of hydrochloric acid, and dilute with water to 55 mL.

Analysis: Omit the addition of 20 mL of 7 N sulfuric acid specified in *Arsenic* <211>, *Method I, Procedure*.

Acceptance criteria: NMT 3 ppm

- **BARIUM:** A platinum wire, dipped in the filtrate obtained in the test for *Acid-Insoluble Substances* and held in a nonluminous flame, does not impart a green color.

• **HEAVY METALS** <231>

Test preparation: Mix 1.0 g with 5 mL of water, slowly add 8 mL of 3 N hydrochloric acid, and evaporate on a steam bath to dryness. Dissolve the residue in 20 mL of water, filter, and add water to the filtrate to make 25 mL.

Acceptance criteria: NMT 20 ppm

• **IRON** <241>

Sample solution: 40 mg in 5 mL of 2 N hydrochloric acid. Transfer to a beaker with the aid of water, and dilute with water to 10 mL.

Standard solution: Transfer 4.0 mL of the *Standard Iron Solution*, prepared as directed in *Iron* <241>, to a beaker, and dilute with water to 10 mL.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

Analytical wavelength: 530 nm

Blank: Water

Analysis: Separately to the *Sample solution* and *Standard solution* add 2 mL of citric acid solution (1 in 5) and 2 drops of thioglycolic acid, adjust with ammonia TS to a pH of 9.5 ± 0.1, dilute with water to 20 mL, and allow to stand for 5 min. Dilute with water to 50 mL. Concomitantly determine the absorbances of the solutions from the *Sample solution* and the *Standard solution*.

Acceptance criteria: NMT 0.1%; the absorbance of the solution from the *Sample solution* does not exceed that of the *Standard solution*.

• **LEAD** <251>

Sample solution: 1.0 g in 5 mL of water

Analysis: To the *Sample solution* slowly add 8 mL of 3 N hydrochloric acid, evaporate on a steam bath to dryness, and dissolve the residue in 5 mL of water.

Acceptance criteria: NMT 3 ppm

• **LIMIT OF FLUORIDE**

[NOTE—Prepare and store all solutions in plastic containers.]

Solution A: 294 mg/mL of sodium citrate dihydrate in water

Sample: 2.0 g

Standard stock solution: 1.11 mg/mL of USP Sodium Fluoride RS in water

Standard solution: Combine 20.0 mL of the *Standard stock solution* with 50.0 mL of *Solution A*, and dilute with water to 100.0 mL. [NOTE—Each mL of this solution contains 100 µg of fluoride ion]

Electrode system: Use a fluoride-specific ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of ±0.2 mV (see *pH* <791>).

Standard response line: Transfer 50.0 mL of *Solution A* and 4.0 mL of hydrochloric acid to a beaker, and add water to make 100 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, stir for 15 min, and read the potential, in mV. Continue stirring, and at 5-min intervals add 100, 100, 300, and 500 µL of the *Standard solution*, reading the potential 5 min after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1, 0.2, 0.5, and 1.0 µg/mL) versus potential, in mV.

Analysis: Transfer the *Sample* to a beaker containing a plastic-coated stirring bar, add 20 mL of water and 4.0 mL of hydrochloric acid, and stir until dissolved. Add 50.0 mL of *Solution A* and sufficient water to make

100 mL of test solution. Rinse and dry the electrodes, insert them into the *Sample solution*, stir for 5 min, and read the potential, in mV. From the measured potential and the *Standard response line*, determine the concentration,  $C$ , in  $\mu\text{g/mL}$ , of fluoride ion in the *Sample solution*. Calculate the content of fluoride in the specimen taken:

$$\text{Result} = (V \times C)/W$$

$V$  = volume of the *Sample solution* (mL)  
 $C$  = concentration of fluoride in the *Sample solution* ( $\mu\text{g/mL}$ )  
 $W$  = weight of *Sample* (g)

Acceptance criteria: 50 ppm

• **LIMIT OF MAGNESIUM AND ALKALI SALTS**

**Sample solution:** 1.0 g

**Analysis:** Mix the *Sample* with 35 mL of water. Carefully add 3 mL of hydrochloric acid, heat the solution, and boil for 1 min. Rapidly add 40 mL of oxalic acid TS, and stir vigorously until precipitation is well-established. Add immediately to the warm mixture 2 drops of methyl red TS and then 6 N ammonium hydroxide, dropwise, until the mixture is just alkaline. Cool to room temperature, transfer to a 100-mL graduated cylinder, dilute with water to 100 mL, mix, and allow to stand for 4 h or overnight. Filter, and to 50 mL of the clear filtrate in a platinum dish add 0.5 mL of sulfuric acid, and evaporate the mixture on a steam bath to a small volume. Carefully heat over a free flame to dryness, and continue heating to complete decomposition and volatilization of ammonium salts. Finally, ignite the residue to constant weight.

**Acceptance criteria:** NMT 1.0%; the weight of the residue is NMT 5 mg.

• **MERCURY, Method IIa (261)**

**Mercury stock solution and Standard mercury solution:** Proceed as directed in *Mercury* (261).

**Standard solution:** Proceed as directed in *Mercury* (261), except use 3 mL of hydrochloric acid instead of 3 mL of sulfuric acid.

**Sample stock solution:** 4.0 g in a 100-mL beaker, and cautiously dissolve in 14 mL of 6 N hydrochloric acid

**Sample solution:** Proceed as directed in *Mercury* (261) using the *Sample stock solution*, except use 3 mL of hydrochloric acid instead of 3 mL of sulfuric acid.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Proceed as directed in *Mercury* (261).

**Acceptance criteria:** 0.5 ppm

**SPECIFIC TESTS**

• **LOSS ON DRYING (731):** Dry a sample at  $200^\circ$  for 4 h: it loses NMT 2.0% of its weight.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS (11)**  
 USP Sodium Fluoride RS

## Calcium Carbonate Lozenges

**DEFINITION**

Calcium Carbonate Lozenges contain NLT 90.0% and NMT 110.0% of the labeled amount of calcium carbonate ( $\text{CaCO}_3$ ).

**IDENTIFICATION**

• **A. IDENTIFICATION TESTS—GENERAL, Calcium (191):** The addition of 6 N hydrochloric acid to a Lozenge produces effervescence, and the resulting solution, after being

boiled to expel carbon dioxide and then neutralized with 6 N ammonium hydroxide, meets the requirements of the tests.

**ASSAY**

• **PROCEDURE**

[NOTE—The *Standard solutions* and the *Sample solution* may be modified, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

**Lanthanum chloride solution:** Transfer 10 g of potassium chloride and 20 g of lanthanum chloride to a 2000-mL volumetric flask. Add 1000 mL of water and 40 mL of hydrochloric acid, mix, and allow to cool. Dilute with water to volume.

**Standard stock solution:** Transfer 250 mg of chelometric standard calcium carbonate, previously dried at  $110^\circ$  for 2 h and then cooled in a desiccator, to a 500-mL volumetric flask. Add 100 mL of water and 12 mL of 1 N hydrochloric acid, swirl to dissolve the calcium carbonate, and allow to cool. Dilute with water to volume. This stock solution contains about 500  $\mu\text{g/mL}$  of calcium carbonate.

**Standard solutions:** To three separate 100-mL volumetric flasks add 2.0, 3.0, and 4.0 mL of the *Standard stock solution*, and dilute each with *Lanthanum chloride solution* to volume. These *Standard solutions* contain 10, 15, and 20  $\mu\text{g/mL}$  of calcium carbonate, respectively.

**Sample stock solution:** Transfer the equivalent to 3000 mg of calcium carbonate, from powdered Lozenges, to a 1000-mL volumetric flask. Add 100 mL of 1 N hydrochloric acid and 300 mL of water, and sonicate to dissolve the powder. Dilute with water to volume.

**Sample solution:** Transfer 5.0 mL of *Sample stock solution* to a 1000-mL volumetric flask, and dilute with *Lanthanum chloride solution* to volume.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Lamp:** Calcium hollow-cathode

**Flame:** Nitrous oxide-acetylene

**Analytical wavelength:** Calcium emission line at 422.7 nm

**Blank:** *Lanthanum chloride solution*

**Analysis**

**Samples:** *Standard solutions*, *Sample solution*, and *Blank*  
 Plot the absorbances of the *Standard solutions* versus their concentrations of calcium carbonate, in  $\mu\text{g/mL}$ , by drawing a straight line best fitting the three plotted points. From the graph determine the concentration,  $C$ , in  $\mu\text{g/mL}$ , of calcium carbonate in the *Sample solution*. Calculate the percentage of label claim of calcium carbonate ( $\text{CaCO}_3$ ) in the portion of Lozenges taken:

$$\text{Result} = (C/C_U) \times 100$$

$C$  = measured concentration of calcium carbonate in the *Sample solution* ( $\mu\text{g/mL}$ ), as calculated above

$C_U$  = nominal concentration of calcium carbonate in the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** 90.0%–110.0%

**OTHER COMPONENTS**

• **SODIUM CONTENT** (if so labeled)

[NOTE—The *Standard solutions* and the *Sample solution* may be modified, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

**Standard stock solution:** Transfer 2.542 g of sodium chloride, previously dried at  $105^\circ$  for 2 h, to a 1000-mL volumetric flask. Dissolve in and dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

**Standard solutions:** To three separate 100-mL volumetric flasks, add 1.0, 3.0, and 5.0 mL of the *Standard stock solution*, and dilute each with water to volume. These *Standard solutions* contain 1.0, 3.0, and 5.0 µg/mL of sodium, respectively.

**Sample stock solution:** Prepare as directed in the Assay. Pass a portion of it, if necessary, through a filter of 0.5-µm or finer pore size, and use the clear solution.

**Sample solution:** Transfer 10.0 mL of the *Sample stock solution* to a 25-mL volumetric flask, and dilute with water to volume.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Lamp:** Sodium hollow-cathode

**Flame:** Air-acetylene

**Analytical wavelength:** Sodium emission line at 589.6 nm

**Blank:** Water

#### Analysis

**Samples:** *Standard solutions*, *Sample solution*, and *Blank*  
Plot the absorbances of the *Standard solutions* versus their contents of sodium, in µg/mL, by drawing a straight line best fitting the three plotted points. From the graph determine the quantity, *C*, in µg, of sodium in each mL of the *Sample solution*.

Calculate the percentage of label claim of sodium in the portion of Lozenges taken:

$$\text{Result} = (C/C_U) \times 100$$

*C* = measured concentration of sodium in the *Sample solution* (µg/mL), as calculated above

*C<sub>U</sub>* = nominal concentration of sodium in the *Sample solution* (µg/mL)

**Acceptance criteria:** NMT 115.0% of the labeled amount

#### PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### SPECIFIC TESTS

- **ACID-NEUTRALIZING CAPACITY** (301)

**Analysis:** The acid consumed by the minimum single dose recommended in the labeling is NLT 5 mEq of acid and NLT the number of mEq calculated by:

$$\text{Result} = (F_C \times C) \times 0.9$$

*F<sub>C</sub>* = theoretical acid-neutralizing capacity of CaCO<sub>3</sub>, 0.02 mEq

*C* = quantity of CaCO<sub>3</sub> in the sample tested (mg), based on the labeled quantity

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

## Calcium Carbonate Oral Suspension

#### DEFINITION

Calcium Carbonate Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of calcium carbonate (CaCO<sub>3</sub>).

#### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, *Calcium* (191): The addition of acetic acid to it produces effervescence (presence of carbonate). The resulting solution, after boiling, meets the requirements.

#### ASSAY

##### • PROCEDURE

**Sample solution:** Transfer a portion of Oral Suspension, equivalent to 1 g of calcium carbonate, previously well shaken in its original container, to a beaker with the aid of 25 mL of water. Add 20 mL of 1 N hydrochloric acid. Heat on a steam bath for 30 min. Allow to cool, and transfer with the aid of water to a 100-mL volumetric flask. Dilute with water to volume. Mix, and filter.

**Blank:** 100 mL of water, 15 mL of 1 N sodium hydroxide, and 5 mL of triethanolamine

#### Titrimetric system

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Indicator:** 100 mg of hydroxy naphthol blue

**Endpoint detection:** Visual, change to distinct blue

**Analysis:** Transfer 20.0 mL of the *Sample solution* to a suitable container. Dilute with water to 100 mL. Add 15 mL of 1 N sodium hydroxide, 5 mL of triethanolamine, and 100 mg of hydroxy naphthol blue. Titrate with the *Titrant*.

Calculate the percentage of the labeled amount of calcium carbonate (CaCO<sub>3</sub>) in the sample taken:

$$\text{Result} = [(V_S - V_B) \times M \times F \times 100]/W$$

*V<sub>S</sub>* = volume of the *Titrant* consumed by the *Sample solution* (mL)

*V<sub>B</sub>* = volume of the *Titrant* consumed by the *Blank* (mL)

*M* = *Titrant* molarity (mmol/mL)

*F* = equivalency factor, 100.09 mg/mmol

*W* = nominal amount of calcium carbonate taken for the *Analysis* (mg)

**Acceptance criteria:** 90.0%–110.0%

#### IMPURITIES

##### • LIMIT OF FLUORIDE

[NOTE—Prepare and store all solutions in plastic containers.]

**Solution A:** 294 mg/mL of sodium citrate dihydrate in water

**Standard stock solution:** 1.1 mg/mL of USP Sodium Fluoride RS in water

**Standard solution:** Combine 20.0 mL of the *Standard stock solution* with 50.0 mL of *Solution A*, and dilute with water to 100.0 mL. [NOTE—Each mL of this solution contains 100 µg of fluoride ion.]

**Sample solution:** Transfer a portion of Oral Suspension, equivalent to 2.0 g of calcium carbonate, to a beaker containing a plastic-coated stirring bar. Add 20 mL of water and 4.0 mL of hydrochloric acid. Stir until dissolved. Add 50.0 mL of *Solution A* and sufficient water to make 100.0 mL.

**Electrode system:** Use a fluoride-specific ion-indicating electrode and a silver-silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of ±0.2 mV (see *pH* (791)).

**Standard response line:** Transfer 50.0 mL of *Solution A* and 4.0 mL of hydrochloric acid to a beaker. Add water to make 100.0 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, and stir for 15 min. Read the potential, in mV. Continue stirring, and at 5-min intervals add 100, 100, 300, and 500 µL of the *Standard solution*, reading the potential 5 min after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1, 0.2, 0.5, and 1.0 µg/mL) versus potential, in mV.

**Analysis:** Rinse and dry the electrodes, and insert them into the *Sample solution*. Stir for 5 min, and read the potential, in mV. From the measured potential and the *Standard response line*, determine the concentration, *C*, in µg/mL, of fluoride ion in the *Sample solution*.

Calculate the content of fluoride in the sample taken:

$$\text{Result} = (V \times C)/W$$

- $V$  = volume of the *Sample solution* (mL)  
 $C$  = determined concentration of fluoride in the *Sample solution* (μg/mL)  
 $W$  = nominal weight of calcium carbonate taken (g)

**Acceptance criteria:** 50 μg/g, with respect to the labeled amount of calcium carbonate

• **ARSENIC, Method I (211)**

**Test preparation:** Slowly dissolve a portion of Oral Suspension equivalent to 1.0 g of calcium carbonate in 15 mL of hydrochloric acid. Dilute with water to 55 mL.

**Analysis:** Proceed as directed in the chapter, except omit the addition of 20 mL of 7 N sulfuric acid specified under *Procedure*.

**Acceptance criteria:** NMT 3 μg/g, with respect to the labeled amount of calcium carbonate

• **LEAD (251)**

**Test preparation:** Mix a portion of Oral Suspension equivalent to 1.0 g of calcium carbonate in 5 mL of water.

**Analysis:** To the *Test preparation* slowly add 8 mL of 3 N hydrochloric acid. Evaporate on a steam bath to dryness, and dissolve the residue in 5 mL of water.

**Acceptance criteria:** NMT 3 μg/g, with respect to the labeled amount of calcium carbonate

• **HEAVY METALS (231)**

**Test preparation:** Mix a portion of Oral Suspension equivalent to 1.0 g of calcium carbonate with 5 mL of water. Slowly add 8 mL of 3 N hydrochloric acid, and evaporate on a steam bath to dryness. Dissolve the residue in 20 mL of water. Filter, and add water to the filtrate to make 25 mL.

**Acceptance criteria:** NMT 20 μg/g, with respect to the labeled amount of calcium carbonate

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count is NMT  $10^2$  cfu/mL. It meets the requirements of the tests for absence of *Escherichia coli* and *Pseudomonas aeruginosa*.
- **PH (791):** 7.5–8.7

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and avoid freezing.
- **USP REFERENCE STANDARDS (11)**  
USP Sodium Fluoride RS

## Calcium Carbonate Tablets

**DEFINITION**

Calcium Carbonate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of calcium carbonate ( $\text{CaCO}_3$ ). For Tablets labeled for any indication other than, or in addition to, antacid use, the Tablets contain NLT 90.0% and NMT 115.0% of the labeled amount of calcium carbonate.

**IDENTIFICATION**

- **A. IDENTIFICATION TESTS—GENERAL, Calcium (191):** The addition of 6 N acetic acid to the Tablets produces effervescence, and the resulting solution, after being boiled to expel carbon dioxide and neutralized with 6 N ammonium hydroxide, meets the requirements.

**ASSAY**

• **PROCEDURE**

**Sample solution:** Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 200 mg of calcium carbonate, to a suitable crucible. Ignite to constant weight. Cool the crucible, add 10 mL of water, and dissolve the residue by adding sufficient 3 N hydrochloric acid, dropwise, to achieve complete solution.

**Blank:** 150 mL of water and 15 mL of 1 N sodium hydroxide

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Indicator:** 300 mg of hydroxy naphthol blue

**Endpoint detection:** Visual, change to distinct blue

**Analysis:** Transfer the *Sample solution* completely to a suitable container, and dilute with water to 150 mL. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue. Titrate with the *Titrant*.

Calculate the percentage of calcium carbonate ( $\text{CaCO}_3$ ) in the sample taken:

$$\text{Result} = [(V_S - V_B) \times M \times F \times 100]/W$$

$V_S$  = volume of the *Titrant* consumed by the *Sample solution* (mL)

$V_B$  = volume of the *Titrant* consumed by the *Blank* (mL)

$M$  = *Titrant* molarity (mmol/mL)

$F$  = equivalency factor, 100.09 mg/mmol

$W$  = weight of calcium carbonate taken (mg)

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of  $\text{CaCO}_3$ . For Tablets labeled for any indication other than, or in addition to, antacid use, 90.0%–115.0% of the labeled amount of  $\text{CaCO}_3$

**PERFORMANCE TESTS**

• **DISSOLUTION (711)**

[NOTE—For Tablets labeled for any indication other than, or in addition to, antacid use.]

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 30 min

**Lanthanum chloride solution:** 50 mg/mL of lanthanum chloride in 0.1 N hydrochloric acid

**Standard stock solution:** 100 μg/mL of calcium in 0.1 N hydrochloric acid

**Standard solutions:** Into separate 100-mL volumetric flasks containing 10.0 mL of *Lanthanum chloride solution* pipet 3-, 4-, 5-, and 6-mL portions of *Standard stock solution* and dilute each with 0.1 N hydrochloric acid to volume to obtain solutions with calcium concentrations of 3, 4, 5, and 6 μg/mL, respectively.

**Sample solution:** Filter a portion of the solution under test. Pipet a volume of the filtrate, estimated to contain 1 mg of calcium, into a 250-mL volumetric flask. Add 25.0 mL of *Lanthanum chloride solution*, and dilute with 0.1 N hydrochloric acid to volume.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 422.8 nm

**Lamp:** Calcium hollow-cathode

**Flame:** Air-acetylene

**Blank:** *Lanthanum chloride solution* and 0.1 N hydrochloric acid (1:9)

**Analysis**

**Samples:** *Standard solutions* and *Sample solution*  
Concomitantly determine the absorbances of the *Standard solutions* and the *Sample solution* against the *Blank*. Construct a standard curve by plotting absorbances versus calcium concentrations of the *Standard solutions*, then from it obtain the concentration,  $C$ , in μg/mL of calcium, of the *Sample solution*.

Calculate the percentage of the labeled amount of calcium carbonate ( $\text{CaCO}_3$ ) dissolved:

$$\text{Result} = (M_r/A_r) \times (C \times D \times V/L) \times 100$$

- $M_r$  = molecular weight of calcium carbonate, 100.09  
 $A_r$  = atomic weight of calcium, 40.08  
 $C$  = measured concentration of calcium in the *Sample solution* (mg/mL)  
 $D$  = dilution factor for the *Sample solution*  
 $V$  = volume of *Medium*, 900 mL  
 $L$  = label claim (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of calcium carbonate ( $\text{CaCO}_3$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### SPECIFIC TESTS

- **ACID-NEUTRALIZING CAPACITY (301):** For Tablets labeled for antacid use  
**Analysis:** Proceed as directed in the chapter.  
**Acceptance criteria:** NLT 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and NLT the number of mEq calculated as follows:

$$\text{Result} = (C \times A_{NC}) \times F$$

- $C$  = quantity of  $\text{CaCO}_3$  in the sample tested (mg), based on the labeled amount  
 $A_{NC}$  = theoretical acid-neutralizing capacity of  $\text{CaCO}_3$ , 0.02 mEq/mg  
 $F$  = acceptance factor for the lower limit of the required acid-neutralizing capacity, 0.9

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate whether it is for use as an antacid, or as a dietary supplement, or both.

### Calcium Carbonate and Magnesia Tablets

#### DEFINITION

Calcium Carbonate and Magnesia Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of calcium carbonate ( $\text{CaCO}_3$ ) and NLT 90.0% and NMT 115.0% of the labeled amount of magnesium hydroxide [ $\text{Mg}(\text{OH})_2$ ].

#### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Calcium (191):** The addition of 3 N hydrochloric acid to the Tablets produces effervescence. The resulting solution, after being boiled to expel carbon dioxide and neutralized with 6 N ammonium hydroxide, meets the requirements of the tests.
- **B. IDENTIFICATION TESTS—GENERAL, Magnesium (191)**  
**Sample solution:** Heat 2 Tablets in 20 mL of 1 N sulfuric acid. Cool, add 20 mL of alcohol, mix, and allow to stand for 30 min. Filter this solution, and add 2 mL of 1 N hydrochloric acid to the filtrate.  
**Acceptance criteria:** The solution meets the requirements.

#### ASSAY

##### • CALCIUM CARBONATE

**Sample solution:** Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 400 mg of calcium carbonate, to a beaker with 25 mL of water. Add 40 mL of 1 N hydrochloric acid. Heat on a steam bath for 30 min, allow to cool, and transfer with the aid of water to a 100-mL volumetric flask. Dilute with water to

volume, mix, filter, and use the filtrate. [NOTE—Reserve a portion of it for the test for *Magnesium Hydroxide*.]

**Analysis:** Transfer 20.0 mL of the *Sample solution* to a suitable container, dilute with water to 100 mL, and add 30 mL of 1 N sodium hydroxide, 5 mL of triethanolamine, and 100 mg of hydroxy naphthol blue. Titrate with 0.05 M edetate disodium VS until the solution is deep blue in color. Each mL of 0.05 M edetate disodium is equivalent to 5.004 mg of  $\text{CaCO}_3$ .

**Acceptance criteria:** 90.0%–110.0%

##### • MAGNESIUM HYDROXIDE

**Sample solution:** Use the *Sample solution* from the test for *Calcium Carbonate*.

**Analysis:** Transfer a portion of the *Sample solution*, equivalent to 120 mg of calcium carbonate and magnesium hydroxide combined, to a suitable container. Dilute with water to 100 mL, and add 10 mL of ammonia–ammonium chloride buffer TS, 5 mL of triethanolamine, and 0.3 mL of eriochrome black TS. Titrate with 0.05 M edetate disodium VS to a blue endpoint. The volume, in mL, of 0.05 M edetate disodium consumed, less the volume of 0.05 M edetate disodium corresponding to the content of calcium carbonate in the volume, in mL, of the *Sample solution* taken, represents the volume, in mL, of 0.05 M edetate disodium equivalent to the quantity of magnesium hydroxide present. Each mL of 0.05 M edetate disodium is equivalent to 2.916 mg of  $\text{Mg}(\text{OH})_2$ .

**Acceptance criteria:** 90.0%–115.0%

#### PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Weight Variation* with respect to calcium carbonate and to magnesia

#### SPECIFIC TESTS

##### • ACID-NEUTRALIZING CAPACITY (301)

**Analysis:** NLT 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and NLT the number of mEq calculated by the formula:

$$\text{Result} = [0.8 \times (F_M \times M)] + [0.9 \times (F_C \times C)]$$

- $F_M$  = theoretical acid-neutralizing capacity of  $\text{Mg}(\text{OH})_2$ , 0.0343 mEq  
 $M$  = quantity of  $\text{Mg}(\text{OH})_2$  in the sample tested (mg), based on the labeled quantity  
 $F_C$  = theoretical acid-neutralizing capacity of  $\text{CaCO}_3$ , 0.02 mEq  
 $C$  = quantity of  $\text{CaCO}_3$  in the sample tested (mg), based on the labeled quantity

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

### Calcium Carbonate and Magnesia Chewable Tablets

#### DEFINITION

Calcium Carbonate and Magnesia Chewable Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of calcium carbonate ( $\text{CaCO}_3$ ) and NLT 90.0% and NMT 115.0% of the labeled amount of magnesium hydroxide [ $\text{Mg}(\text{OH})_2$ ].

#### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Calcium (191):** The addition of 3 N hydrochloric acid to the Chewable Tablets produces effervescence. The resulting solution, after being boiled to expel carbon dioxide and neutralized

with 6 N ammonium hydroxide, meets the requirements of the tests.

• **B. IDENTIFICATION TESTS—GENERAL, *Magnesium* <191>**

**Sample solution:** Heat 2 Chewable Tablets in 20 mL of 1 N sulfuric acid. Cool, add 20 mL of alcohol, mix, and allow to stand for 30 min. Filter this solution, and add 2 mL of 1 N hydrochloric acid to the filtrate.

**Acceptance criteria:** The solution meets the requirements.

**ASSAY**

• **CALCIUM CARBONATE**

**Sample solution:** Finely powder NLT 20 Chewable Tablets. Transfer a portion of the powder, equivalent to 400 mg of calcium carbonate, to a beaker with 25 mL of water. Add 40 mL of 1 N hydrochloric acid. Heat on a steam bath for 30 min, allow to cool, and transfer with the aid of water to a 100-mL volumetric flask. Dilute with water to volume, mix, filter, and use the filtrate. [NOTE—Reserve a portion of it for the test for *Magnesium Hydroxide*.]

**Analysis:** Transfer 20.0 mL of the *Sample solution* to a suitable container, dilute with water to 100 mL, and add 30 mL of 1 N sodium hydroxide, 5 mL of triethanolamine, and 100 mg of hydroxy naphthol blue. Titrate with 0.05 M edetate disodium VS until the solution is deep blue in color. Each mL of 0.05 M edetate disodium is equivalent to 5.004 mg of  $\text{CaCO}_3$ .

**Acceptance criteria:** 90.0%–110.0%

• **MAGNESIUM HYDROXIDE**

**Sample solution:** Use the *Sample solution* from the test for *Calcium Carbonate*.

**Analysis:** Transfer a portion of the *Sample solution*, equivalent to 120 mg of calcium carbonate and magnesium hydroxide combined, to a suitable container. Dilute with water to 100 mL, and add 10 mL of ammonia–ammonium chloride buffer TS, 5 mL of triethanolamine, and 0.3 mL of eriochrome black TS. Titrate with 0.05 M edetate disodium VS to a blue endpoint. The volume, in mL, of 0.05 M edetate disodium consumed, less the volume of 0.05 M edetate disodium corresponding to the content of calcium carbonate in the volume, in mL, of the *Sample solution* taken, represents the volume, in mL, of 0.05 M edetate disodium equivalent to the quantity of magnesium hydroxide present. Each mL of 0.05 M edetate disodium is equivalent to 2.916 mg of  $\text{Mg}(\text{OH})_2$ .

**Acceptance criteria:** 90.0%–115.0%

**PERFORMANCE TESTS**

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Weight Variation* with respect to calcium carbonate and to magnesium

**SPECIFIC TESTS**

• **ACID-NEUTRALIZING CAPACITY <301>**

**Analysis:** NLT 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and NLT the number of mEq calculated by the formula:

$$\text{Result} = [0.8 \times (F_M \times M)] + [0.9 \times (F_C \times C)]$$

$F_M$  = theoretical acid-neutralizing capacity of  $\text{Mg}(\text{OH})_2$ , 0.0343 mEq

$M$  = quantity of  $\text{Mg}(\text{OH})_2$  in the sample tested (mg), based on the labeled quantity

$F_C$  = theoretical acid-neutralizing capacities of  $\text{CaCO}_3$ , 0.02 mEq

$C$  = quantity of  $\text{CaCO}_3$  in the sample tested (mg), based on the labeled quantity

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label the Chewable Tablets to indicate that they must be chewed before being swallowed.

## Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets

**Former Title:** *Calcium Carbonate, Magnesia, and Simethicone Tablets*

» Calcium Carbonate, Magnesia, and Simethicone Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of calcium carbonate ( $\text{CaCO}_3$ ) and magnesium hydroxide [ $\text{Mg}(\text{OH})_2$ ], and an amount of polydimethylsiloxane [ $-(\text{CH}_3)_2\text{SiO}-$ ] $_n$  that is not less than 85.0 percent and not more than 115.0 percent of the labeled amount of simethicone.

**Packaging and storage—**Preserve in well-closed containers.

**Labeling—**Label it to indicate that the Chewable Tablets are to be chewed before swallowing. Label the Chewable Tablets to state the sodium content, in mg per Chewable Tablet, if it is greater than 5 mg per Chewable Tablet.

**USP Reference standards <11>—**

USP Polydimethylsiloxane RS

**Identification—**

**A: Infrared Absorption <197S>—**

**Solution—**Using Chewable Tablets, proceed to obtain IR absorption spectra as directed in the *Assay for polydimethylsiloxane under Alumina, Magnesia, and Simethicone Chewable Tablets*.

**B:** The addition of 1 N hydrochloric acid to a Chewable Tablet produces effervescence, and the resulting solution, after having been filtered, meets the requirements of the tests for *Calcium* <191>.

**C:** Heat 2 Chewable Tablets in 20 mL of 1 N sulfuric acid. Cool, add 20 mL of alcohol, mix, and allow to stand for 30 minutes. Filter this solution, and to the filtrate add 2 mL of 1 N hydrochloric acid: this solution meets the requirements of the tests for *Magnesium* <191>.

**Uniformity of dosage units (905):** meet the requirements for *Weight Variation* with respect to calcium carbonate and to magnesium hydroxide.

**Acid-neutralizing capacity <301>—**Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling.

**Content of sodium (if so labeled)—**

**Lanthanum chloride solution—**Prepare as directed in the *Assay for calcium carbonate and magnesium hydroxide*.

**Dilute hydrochloric acid—**Prepare as directed in the *Assay for polydimethylsiloxane*.

**Standard solution—**Transfer 2.542 g of sodium chloride, previously dried at 105° for 2 hours, to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 4.0 mL of this solution to a second 100-mL volumetric flask containing 6.0 mL of *Dilute hydrochloric acid* and 2.0 mL of *Lanthanum chloride solution*, dilute with water to volume, and mix. This solution contains 2.0 µg of sodium (Na) per mL.

**Test solution—**Transfer 3.0 mL of the aqueous layer retained from the preparation of the *Assay preparation* in the *Assay for polydimethylsiloxane* to a 50-mL volumetric flask containing 1.0 mL of *Lanthanum chloride solution*, dilute with water to volume, and mix.

**Blank solution—**Transfer 15.0 mL of *Dilute hydrochloric acid* and 5.0 mL of *Lanthanum chloride solution* to a 250-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard solution* and the *Test solution* at the sodium emission line at 589.0 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a sodium hollow-cathode lamp and an air-acetylene flame, using the *Blank solution* as the blank. Calculate the mg of sodium (Na) in each Chewable Tablet taken by the formula:

$$(5C/6)(A/W)(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of sodium in the *Standard solution*; A is the average weight, in mg, of each Chewable Tablet; W is the weight, in mg, of the portion of Chewable Tablets from the preparation of the *Assay preparation* in the *Assay for polydimethylsiloxane* used to prepare the *Test solution*; and  $A_U$  and  $A_S$  are the absorbances of the *Test solution* and the *Standard solution*, respectively. Each Chewable Tablet contains not more than the number of mg of sodium stated on the label.

#### **Assay for polydimethylsiloxane—**

**Saccharin solution**—Prepare a solution of saccharin in 4-methyl-2-pentanone containing 12.5 mg per mL.

**Dilute hydrochloric acid**—Mix 200 mL of hydrochloric acid with sufficient water to make 1000 mL.

**Standard preparation**—Dissolve a suitable quantity of USP Polydimethylsiloxane RS in 4-methyl-2-pentanone to obtain a stock solution having a known concentration of about 1 mg per mL. On the day of use, transfer 20.0 mL of this solution and 5.0 mL of *Saccharin solution* to a 250-mL volumetric flask, dilute with 4-methyl-2-pentanone to volume, and mix. This solution contains about 0.08 mg of USP Polydimethylsiloxane RS per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of polydimethylsiloxane, to a 125-mL separator. Cautiously add 50.0 mL of *Dilute hydrochloric acid*, and swirl until the reaction subsides. Insert the stopper, and mix. Carefully release the pressure, add 50.0 mL of 4-methyl-2-pentanone, and mix for 10 minutes. Allow the layers to separate, and drain the aqueous layer into a suitable stoppered container. [NOTE—Retain this aqueous layer for use in preparing the *Assay preparation* in the *Assay for calcium carbonate and magnesium hydroxide* and for the preparation of the *Test solution* in the test for *Content of sodium*.] Filter the organic layer through a filter containing 50 g of anhydrous sodium sulfate. Transfer 10.0 mL of the filtrate to a 50-mL volumetric flask, add 1.0 mL of *Saccharin solution*, dilute with methyl isobutyl ketone to volume, and mix.

**Blank solution**—Transfer 1.0 mL of *Saccharin solution* to a 50-mL volumetric flask, dilute with 4-methyl-2-pentanone to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* at the silicon emission line at 251.6 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a silicon hollow-cathode lamp and a nitrous oxide-acetylene flame, using the *Blank solution* as the blank. Calculate the quantity, in mg, of polydimethylsiloxane in each Chewable Tablet taken by the formula:

$$250C(A/W)(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Polydimethylsiloxane RS in the *Standard preparation*; A is the average weight, in mg, of each Chewable Tablet; W is the weight, in mg, of the portion of Chewable Tablets taken to prepare the *Assay preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

#### **Assay for calcium carbonate and magnesium hydroxide—**

**Lanthanum chloride solution**—Transfer 26.8 g of lanthanum chloride to a 200-mL volumetric flask, add 100 mL of water, and carefully add 50 mL of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume, and mix.

**Dilute hydrochloric acid**—Prepare as directed in the *Assay for polydimethylsiloxane*.

**Calcium stock standard solution**—Transfer 499.5 mg of primary standard calcium carbonate to a 200-mL volumetric flask, and add 10 mL of water. Carefully add 5 mL of *Dilute hydrochloric acid*, and swirl to dissolve the calcium carbonate. Dilute with water to volume, and mix. This solution contains 1000  $\mu\text{g}$  of calcium (Ca) per mL.

**Magnesium stock standard solution**—Transfer 1.000 g of magnesium metal to a 1000-mL volumetric flask containing 10 mL of water, slowly add 10 mL of hydrochloric acid, and swirl to dissolve the metal. Dilute with water to volume, and mix. This solution contains 1000  $\mu\text{g}$  of magnesium (Mg) per mL.

**Calcium and magnesium standard preparation**—To a 250-mL volumetric flask add 10.0 mL of *Calcium stock standard solution* and 5.0 mL of *Magnesium stock standard solution*, dilute with water to volume, and mix. This solution contains 40  $\mu\text{g}$  of calcium (Ca) and 20  $\mu\text{g}$  of magnesium (Mg) per mL. On the day of use, transfer 4.0 mL of this solution to a 100-mL volumetric flask containing 2.0 mL of *Lanthanum chloride solution*, dilute with water to volume, and mix. This solution contains 1.6  $\mu\text{g}$  of calcium (Ca) and 0.8  $\mu\text{g}$  of magnesium (Mg) per mL.

**Assay preparation**—Transfer an accurately measured volume of the aqueous layer retained from the preparation of the *Assay preparation* in the *Assay for polydimethylsiloxane*, equivalent to about 28 mg of calcium carbonate, to a 200-mL volumetric flask, dilute with water to volume, and mix. Transfer 3.0 mL of this solution to a 100-mL volumetric flask containing 2.0 mL of *Lanthanum chloride solution*, dilute with water to volume, and mix.

**Blank solution**—Transfer 5.0 mL of *Lanthanum chloride solution* to a 250-mL volumetric flask, dilute with water to volume, and mix.

**Procedure for calcium carbonate**—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* at the calcium emission line at 422.7 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a calcium hollow-cathode lamp and a nitrous oxide-acetylene flame, using the *Blank solution* as the blank. Calculate the quantity, in mg, of calcium carbonate ( $\text{CaCO}_3$ ) in each Chewable Tablet taken by the formula:

$$(100.09/40.08)(1000C/3V)(A/W)(A_U / A_S)$$

in which 100.09 is the molecular weight of calcium carbonate; 40.08 is the atomic weight of calcium; C is the concentration, in  $\mu\text{g}$  per mL, of calcium in the *Standard preparation*; V is the volume, in mL, of the aqueous layer retained from the preparation of the *Assay preparation* in the *Assay for polydimethylsiloxane* used to prepare the *Assay preparation*; A is the average weight, in mg, of each Chewable Tablet; W is the weight, in mg, of the portion of Chewable Tablets taken to prepare the *Assay preparation* in the *Assay for polydimethylsiloxane*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

**Procedure for magnesium hydroxide**—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* at the magnesium emission line at 285.2 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a magnesium hollow-cathode lamp and a nitrous oxide-acetylene flame, using the *Blank solution* as the blank.

Calculate the quantity, in mg, of magnesium hydroxide [ $\text{Mg}(\text{OH})_2$ ] in each Chewable Tablet taken by the formula:

$$(58.34/24.305)(1000C/3V)(A/W)(A_U/A_S)$$

in which 58.34 is the molecular weight of magnesium hydroxide; 24.305 is the atomic weight of magnesium; C is the concentration, in  $\mu\text{g}$  per mL, of magnesium in the *Standard preparation*; V is the volume, in mL, of the aqueous layer retained from the preparation of the *Assay preparation* in the *Assay for polydimethylsiloxane* used to prepare the *Assay preparation*; A is the average weight, in mg, of each Chewable Tablet taken; W is the weight, in mg, of the portion of Chewable Tablets taken to prepare the *Assay preparation* in the *Assay for polydimethylsiloxane*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Calcium and Magnesium Carbonates Oral Suspension

### DEFINITION

Calcium and Magnesium Carbonates Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of calcium carbonate ( $\text{CaCO}_3$ ) and NLT 85.0% and NMT 115.0% of the labeled amount of magnesium carbonate ( $\text{MgCO}_3$ ).

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Calcium <191>:** The addition of 3 N hydrochloric acid to a quantity of Oral Suspension, equivalent to 500 mg of calcium carbonate, produces effervescence, and the resulting solution, after having been filtered, meets the requirements.
- **B. IDENTIFICATION TESTS—GENERAL, Magnesium <191>:**  
**Sample solution:** Heat a quantity of Oral Suspension, equivalent to 800 mg of magnesium carbonate, with 20 mL of 1 N sulfuric acid. Cool, add 20 mL of alcohol, mix, and allow to stand for 30 min. Filter this solution, and add 2 mL of 1 N hydrochloric acid to the filtrate.  
**Acceptance criteria:** Meets the requirements

### ASSAY

#### • CALCIUM CARBONATE

**Sample solution:** Transfer a portion of Oral Suspension equivalent to 400 mg of calcium carbonate, previously well shaken in its original container and free of air bubbles, to a beaker, with the aid of 20 mL of water, and add 10 mL of 1 N hydrochloric acid. Heat on a steam bath for 30 min, allow to cool, transfer with the aid of water to a 100-mL volumetric flask, dilute with water to volume, filter and use the filtrate. [NOTE—Reserve a portion of the filtrate for the *Sample solution* in the *Magnesium Carbonate* test.]

**Analysis:** Transfer 20.0 mL of *Sample solution* to a suitable container. Dilute with water to 100 mL, and add 15 mL of 1 N sodium hydroxide, 5 mL of triethanolamine, and 100 mg of hydroxy naphthol blue. Titrate with 0.05 M edetate disodium VS until the solution is deep blue. Each mL of 0.05 M edetate disodium is equivalent to 5.004 mg of  $\text{CaCO}_3$ .

**Acceptance criteria:** 90.0%–110.0%

#### • MAGNESIUM CARBONATE

**Sample solution:** Use a portion of the filtrate from the *Sample solution* in the *Calcium Carbonate* test.

**Analysis:** Transfer the *Sample solution*, equivalent to 120 mg of calcium carbonate and magnesium carbonate combined, to a suitable container. Dilute with water to 100 mL, and add 10 mL of ammonia–ammonium chloride buffer TS, 5 mL of triethanolamine, and 0.3 mL of eriochrome black TS. Titrate with 0.05 M edetate disodium VS to a blue endpoint. From the volume of

0.05 M edetate disodium consumed, subtract the volume of 0.05 M edetate disodium corresponding to the content of calcium carbonate in the portion of the *Sample solution* taken. The difference is the volume of 0.05 M edetate disodium equivalent to the quantity of magnesium carbonate present. Each mL of 0.05 M edetate disodium is equivalent to 4.216 mg of  $\text{MgCO}_3$ .

**Acceptance criteria:** 85.0%–115.0%

### PERFORMANCE TESTS

- **DELIVERABLE VOLUME <698>:** Meets the requirements

### SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS <61> and TESTS FOR SPECIFIED MICROORGANISMS <62>:** The total aerobic microbial count is NMT 100 cfu/mL, and it meets the requirements of the tests for absence of *Escherichia coli* and *Pseudomonas aeruginosa*.
- **PH <791>:** 7.0–8.6
- **ACID-NEUTRALIZING CAPACITY <301>:** NLT 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and NLT the number of mEq calculated:

$$\text{Result} = [(F_M \times M) \times 0.8] + [(F_C \times C) \times 0.9]$$

$F_M$  = theoretical acid-neutralizing capacity of  $\text{MgCO}_3$ , 0.024 mEq

$M$  = quantity of  $\text{MgCO}_3$  in the specimen tested, based on the labeled quantity (mg)

$F_C$  = theoretical acid-neutralizing capacity of  $\text{CaCO}_3$ , 0.02 mEq

$C$  = quantity of  $\text{CaCO}_3$  in the specimen tested, based on the labeled quantity (mg)

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and avoid freezing.

## Calcium and Magnesium Carbonates Tablets

### DEFINITION

Calcium and Magnesium Carbonates Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of calcium carbonate ( $\text{CaCO}_3$ ) and NLT 85.0% and NMT 115.0% of the labeled amount of magnesium carbonate ( $\text{MgCO}_3$ ).

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Calcium <191>:** The addition of 1 N hydrochloric acid to 1 Tablet produces effervescence, and the resulting solution, after having been filtered, meets the requirements of the tests.
- **B. IDENTIFICATION TESTS—GENERAL, Magnesium <191>:**  
**Sample solution:** Heat 2 Tablets in 20 mL of 1 N sulfuric acid. Cool, add 20 mL of alcohol, mix, and allow to stand for 30 min. Filter this solution, and add 2 mL of 1 N hydrochloric acid to the filtrate.  
**Acceptance criteria:** Meet the requirements

### ASSAY

#### • CALCIUM CARBONATE

**Sample solution:** Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 400 mg of calcium carbonate, to a beaker with the aid of 25 mL of water, and add 10 mL of 1 N hydrochloric acid. Heat on a steam bath for 30 min, allow to cool, and transfer to a 100-mL volumetric flask with the aid of water. Dilute with water to volume, mix, filter, and use the filtrate. [NOTE—Reserve a portion of the filtrate for the *Sample solution* in the *Magnesium Carbonate* test.]

**Analysis:** Transfer 20.0 mL of *Sample solution* to a suitable container. Dilute with water to 100 mL, and add

15 mL of 1 N sodium hydroxide, 5 mL of triethanolamine, and 100 mg of hydroxy naphthol blue. Titrate with 0.05 M edetate disodium VS until the solution is deep blue. Each mL of 0.05 M edetate disodium is equivalent to 5.004 mg of  $\text{CaCO}_3$ .

Acceptance criteria: 90.0%–110.0%

#### • MAGNESIUM CARBONATE

**Sample solution:** Use a portion of the filtrate from the *Sample solution* in the *Calcium Carbonate* test.

**Analysis:** Transfer the *Sample solution* equivalent to 120 mg of calcium carbonate and magnesium carbonate combined to a suitable container. Dilute with water to 100 mL, and add 10 mL of ammonia–ammonium chloride buffer TS, 5 mL of triethanolamine, and 0.3 mL of eriochrome black TS. Titrate with 0.05 M edetate disodium VS to a blue endpoint. From the volume of 0.05 M edetate disodium consumed, subtract the volume of 0.05 M edetate disodium corresponding to the content of calcium carbonate in the portion of the *Sample solution* taken. The difference is the volume of 0.05 M edetate disodium equivalent to the quantity of magnesium carbonate present. Each mL of 0.05 M edetate disodium is equivalent to 4.216 mg of  $\text{MgCO}_3$ .

Acceptance criteria: 85.0%–115.0%

#### PERFORMANCE TESTS

##### • DISINTEGRATION <701>

**Time:** NMT 10 min, except that where Tablets are labeled as gelatin-coated, the time is NMT 30 min, simulated gastric fluid TS being substituted for water in the test

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Weight Variation* with respect to calcium carbonate and to magnesium carbonate

#### SPECIFIC TESTS

##### • ACID-NEUTRALIZING CAPACITY <301>

**Analysis:** NLT 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and NLT the number of mEq calculated:

$$\text{Result} = [(F_M \times M) \times 0.8] + [(F_C \times C) \times 0.9]$$

$F_M$  = theoretical acid-neutralizing capacity of  $\text{MgCO}_3$ , 0.024 mEq

$M$  = quantity of  $\text{MgCO}_3$  in the specimen tested, based on the labeled quantity (mg)

$F_C$  = theoretical acid-neutralizing capacity of  $\text{CaCO}_3$ , 0.02 mEq

$C$  = quantity of  $\text{CaCO}_3$  in the specimen tested, based on the labeled quantity (mg)

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Tablets that are gelatin-coated are so labeled.

## Calcium Chloride

$\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$  147.01  
Calcium chloride dihydrate [10035-04-8].

$\text{CaCl}_2$  110.98  
Anhydrous [10043-52-4].

#### DEFINITION

Calcium Chloride contains an amount of  $\text{CaCl}_2$  equivalent to NLT 99.0% and NMT 107.0% of  $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$ .

#### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Calcium <191>**  
**Sample solution:** 100 mg/mL  
**Acceptance criteria:** Meets the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Chloride <191>**  
**Sample solution:** 100 mg/mL  
**Acceptance criteria:** Meets the requirements

#### ASSAY

##### • PROCEDURE

**Sample solution:** Dissolve 1 g of Calcium Chloride in a mixture of water and 3 N hydrochloric acid (100:5). Transfer the solution to a 250-mL volumetric flask, and dilute with water to volume.

**Analysis:** Pipet 50 mL of the *Sample solution* into a suitable container, and add 100 mL of water, 15 mL of 1 N sodium hydroxide, and 300 mg of hydroxy naphthol blue. Titrate with 0.05 M edetate disodium VS until the solution is deep blue. Each mL of 0.05 M edetate disodium is equivalent to 7.351 mg of calcium chloride dihydrate ( $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$ ).

Acceptance criteria: 99.0%–107.0% of  $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$

#### IMPURITIES

##### • ALUMINUM <206>

[NOTE—Perform if labeled as intended for use in hemodialysis.]

**Test preparation:** Use a 2.0-g sample.

Acceptance criteria: NMT 1 ppm

##### • HEAVY METALS <231>

**Sample solution:** 80 mg/mL

Acceptance criteria: NMT 10 ppm

##### • IRON, ALUMINUM, AND PHOSPHATE

**Sample solution:** 50 mg/mL

**Analysis:** Add 2 drops of 3 N hydrochloric acid and 1 drop of phenolphthalein TS to the *Sample solution*.

Then add ammonium chloride–ammonium hydroxide TS, dropwise, until the solution is faintly pink. Add 2 drops in excess, and heat the liquid to boiling.

Acceptance criteria: No turbidity or precipitate is produced.

##### • LIMIT OF MAGNESIUM AND ALKALI SALTS

**Sample solution:** 20 mg/mL

**Analysis:** To 50 mL of *Sample solution* add 500 mg of ammonium chloride. Heat the solution, and boil for 1 min. Rapidly add 40 mL of oxalic acid TS, and stir vigorously until precipitation is well established. Add immediately to the warm mixture 2 drops of methyl red TS and then 6 N ammonium hydroxide, dropwise, until the mixture is just alkaline. Cool to room temperature. Transfer to a 100-mL graduated cylinder, dilute with water to 100 mL, mix, and allow to stand for 4 h or overnight. Filter, and to 50 mL of the clear filtrate in a platinum dish, add 0.5 mL of sulfuric acid, and evaporate the mixture on a steam bath to a small volume. Carefully heat over a free flame to dryness, and continue heating to complete decomposition and volatilization of ammonium salts. Finally, ignite the residue to constant weight.

Acceptance criteria: The weight of the residue is NMT 5 mg (1.0%).

#### SPECIFIC TESTS

##### • PH <791>

**Sample solution:** 50 mg/mL

Acceptance criteria: 4.5–9.2

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Where Calcium Chloride is intended for use in hemodialysis, it is so labeled.

## Calcium Chloride Injection

» Calcium Chloride Injection is a sterile solution of Calcium Chloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$ .

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—

USP Endotoxin RS

**Identification**—It responds to the tests for *Calcium* and *Chloride* (191).

**Bacterial endotoxins** (85)—It contains not more than 0.2 USP Endotoxin Unit per mg of calcium chloride.

**pH** (791): between 5.5 and 7.5 in the undiluted Injection, except where the concentration is greater than 1 in 20, in which case this range applies to the Injection diluted with water to yield a concentration of 1 in 20.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 1 g of calcium chloride, to a 250-mL volumetric flask, add 5 mL of 3 N hydrochloric acid, dilute with water to volume, and mix. Pipet 50 mL of the resulting solution into a suitable container, add 100 mL of water, 15 mL of 1 N sodium hydroxide, and 300 mg of hydroxy naphthol blue, and titrate with 0.05 M edetate disodium VS until the solution is deep blue. Each mL of 0.05 M edetate disodium is equivalent to 7.351 mg of  $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$ .

## Calcium Citrate

$\text{C}_{12}\text{H}_{10}\text{Ca}_3\text{O}_{14} \cdot 4\text{H}_2\text{O}$  570.49  
1,2,3-Propanetricarboxylic acid, 2-hydroxy-, calcium salt (2:3), tetrahydrate;  
Calcium citrate (3:2), tetrahydrate [5785-44-4].

### DEFINITION

Calcium Citrate contains four molecules of water of hydration. When dried at 150° to constant weight, it contains NLT 97.5% and NMT 100.5% of  $\text{Ca}_3(\text{C}_6\text{H}_5\text{O}_7)_2$ .

### IDENTIFICATION

#### • A.

**Analysis:** Dissolve 0.5 g in a mixture of 10 mL of water and 2.5 mL of 2 N nitric acid. Add 1 mL of mercuric sulfate TS, heat to boiling, and add 1 mL of potassium permanganate TS.

**Acceptance criteria:** A white precipitate is formed.

#### • B.

**Sample:** 0.5 g of Calcium Citrate

**Analysis:** Ignite completely the *Sample* at as low a temperature as possible, cool, and dissolve the residue in dilute glacial acetic acid (1:10). Filter, and add 10 mL of ammonium oxalate TS to the filtrate.

**Acceptance criteria:** A voluminous white precipitate that is soluble in hydrochloric acid is formed.

### ASSAY

#### • PROCEDURE

**Sample solution:** Dissolve 350 mg of Calcium Citrate, previously dried at 150° to constant weight, in 12 mL of 0.5 M hydrochloric acid, and dilute with water to about 100 mL.

**Analysis:** While stirring the *Sample solution*, add 30 mL of 0.05 M edetate disodium VS from a 50-mL buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 8.307 mg of calcium citrate ( $\text{Ca}_3(\text{C}_6\text{H}_5\text{O}_7)_2$ ).

**Acceptance criteria:** 97.5%–100.5% on the dried basis

### IMPURITIES

#### • ARSENIC, Method I (211)

**Test preparation:** Dissolve 1 g of Calcium Citrate in 5 mL of 3 N hydrochloric acid, and dilute with water to 35 mL.

**Acceptance criteria:** NMT 3 ppm

#### • HEAVY METALS, Method I (231)

**Test preparation:** Dissolve 1 g of Calcium Citrate in a mixture of hydrochloric acid and water (2:20). Add 1.5 mL of ammonium hydroxide, and dilute with water to 25 mL.

**Acceptance criteria:** NMT 20 ppm

#### • LEAD (251)

**Test preparation:** Dissolve 0.5 g of Calcium Citrate in 20 mL of 3 N hydrochloric acid. Evaporate this solution on a steam bath to 10 mL, dilute with water to 20 mL, and cool. Use 5 mL of *Diluted Standard Lead Solution* (5 µg of Pb) for the test.

**Acceptance criteria:** NMT 10 ppm

#### • LIMIT OF FLUORIDE

[NOTE—Prepare and store all solutions in plastic containers.]

**Standard stock solution:** 1000 µg/mL of fluoride ion from USP Sodium Fluoride RS in water

**Standard solution:** 5 µg/mL of fluoride ion from *Standard stock solution*. [NOTE—Prepare on the day of use.]

**Linearity solution A:** Transfer 1.0 mL of the *Standard solution* to a 250-mL plastic beaker. Add 50 mL of water, 5 mL of 1 N hydrochloric acid, 10 mL of 1.0 M sodium citrate, and 10 mL of 0.2 M edetate disodium. If necessary, adjust with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of 5.5. Transfer to a 100-mL volumetric flask, and dilute with water to volume. This solution contains 0.05 µg/mL of fluoride.

**Linearity solution B:** Transfer 5.0 mL of the *Standard solution* to a 250-mL plastic beaker, and proceed as directed for *Linearity solution A* beginning with "Add 50 mL of water,". This solution contains 0.25 µg/mL of fluoride.

**Linearity solution C:** Transfer 10.0 mL of the *Standard solution* to a 250-mL plastic beaker, and proceed as directed for *Linearity solution A* beginning with "Add 50 mL of water,". This solution contains 0.50 µg/mL of fluoride.

**Sample solution:** Transfer 1.0 g of Calcium Citrate to a 100-mL beaker. Add 10 mL of water and, while stirring, 10 mL of 1 N hydrochloric acid. When dissolved, boil rapidly for 1 min, transfer the solution to a 250-mL plastic beaker, and cool in ice water. Add 15 mL of 1.0 M sodium citrate and 10 mL of 0.2 M edetate disodium.

dium, and adjust with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of 5.5. Transfer this solution to a 100-mL volumetric flask, and dilute with water to volume.

**Electrode system:** Use a fluoride-specific, ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of  $\pm 0.2$  mV (see pH <791>).

#### Analysis

**Samples:** *Linearity solution A*, *Linearity solution B*, *Linearity solution C*, and *Sample solution*

Transfer 50 mL of each *Linearity solution A*, *Linearity solution B*, and *Linearity solution C* to separate 250-mL plastic beakers, and measure the potential of each solution with the *Electrode system*. Between each reading wash the electrodes with water, and absorb any residual water by blotting the electrodes dry. Plot the logarithms of the fluoride concentrations (0.05, 0.25, and 0.50  $\mu\text{g/mL}$ , respectively) versus potential to obtain a Standard response line.

Transfer 50 mL of the *Sample solution* to a 250-mL plastic beaker, and measure the potential with the *Electrode system*. From the measured potential and the Standard response line determine the concentration, *C*, in  $\mu\text{g/mL}$ , of fluoride ion in the *Sample solution*. Calculate the percentage of fluoride in the specimen taken by multiplying *C* by 0.01.

**Acceptance criteria:** NMT 0.003%

#### • LIMIT OF ACID-INSOLUBLE SUBSTANCES

**Sample solution:** Dissolve 5 g of Calcium Citrate by heating with a mixture of hydrochloric acid and water (10:50) for 30 min.

**Analysis:** Filter, wash, and dry at 105° for 2 h the residue so obtained.

**Acceptance criteria:** The weight of the residue is NMT 10 mg (0.2%).

#### SPECIFIC TESTS

- **LOSS ON DRYING** <731>: Dry a sample at 150° for 4 h: it loses from 10.0% to 13.3% of its weight.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** <11>  
USP Sodium Fluoride RS

## Calcium Glubionate Syrup

#### DEFINITION

Calcium Glubionate Syrup is a solution containing equimolar amounts of Calcium Gluconate and Calcium Lactobionate or with Calcium Lactobionate predominating. It contains NLT 95.0% and NMT 105.0% of the labeled amount of calcium (Ca).

#### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, *Calcium* <191>  
**Sample solution:** Syrup in water (1 in 10)  
**Acceptance criteria:** Meets the requirements
- **B. THIN-LAYER CHROMATOGRAPHY**  
**Standard solution:** 2 mg/mL of calcium gluconate and 4 mg/mL of calcium lactobionate in water  
**Sample solution:** Equivalent to 0.4 mg/mL of calcium, from Syrup in water  
**Chromatographic system**  
(See *Chromatography* <621>, *Thin-Layer Chromatography*.)  
**Adsorbent:** 0.25-mm layer of chromatographic silica gel  
**Application volume:** 5  $\mu\text{L}$   
**Developing solvent system:** Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)

**Spray reagent:** Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask. Add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber and dry at 100° for 20 min. Allow to cool, and spray with *Spray reagent*. Heat the plate at 110° for 10 min.

**Acceptance criteria:** The two principal spots of the *Sample solution* correspond in color, size, and  $R_f$  value to those obtained from the *Standard solution*. [NOTE—Sucrose, if present in the *Sample solution*, appears in the chromatogram as a spot between the two principal spots.]

#### ASSAY

##### • PROCEDURE

**Sample solution:** Transfer a portion of Syrup equivalent to 70 mg of Ca into a suitable beaker. Add 2 mL of 3 N hydrochloric acid, and dilute with water to 150 mL.

**Analysis:** While stirring the *Sample solution* with a magnetic stirrer, add 20 mL of 0.05 M edetate disodium VS from a 50-mL buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 2.004 mg of calcium (Ca).

**Acceptance criteria:** 95.0%–105.0%

#### SPECIFIC TESTS

- **pH** <791>: 3.4–4.5

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, at a temperature not exceeding 30°, and avoid freezing.

## Calcium Gluceptate

$\text{C}_{14}\text{H}_{26}\text{CaO}_{16}$  (anhydrous) 490.42  
Glucoheptonic acid, calcium salt (2:1);  
Calcium glucoheptonate (1:2) [29039-00-7].

#### DEFINITION

Calcium Gluceptate is anhydrous or contains varying amounts of water of hydration. It consists of the calcium salt of the alpha epimer of glucoheptonic acid or of a mixture of the alpha and beta epimers of glucoheptonic acid. It contains NLT 95.0% and NMT 102.0% of calcium gluceptate ( $\text{C}_{14}\text{H}_{26}\text{CaO}_{16}$ ), calculated on the dried basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B. IDENTIFICATION TESTS—GENERAL**, *Calcium* <191>: A 20-mg/mL solution meets the requirements.

#### ASSAY

##### • PROCEDURE

**Sample:** 800 mg of Calcium Gluceptate

**Blank:** 150 mL of water containing 2 mL of 3 N hydrochloric acid

**Titrimetric system**

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* with 150 mL of water containing 2 mL of 3 N hydrochloric acid. While stirring, preferably with a magnetic stirrer, add 25 mL of *Titrant* from the titration buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue endpoint. Perform the *Blank* determination.

Calculate the percentage of calcium gluceptate ( $C_{14}H_{26}CaO_{16}$ ) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times M \times F]/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$M$  = actual molarity of the *Titrant* (mM/mL)

$F$  = equivalency factor, 490.4 mg/mM

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 95.0%–102.0% on the dried basis

#### IMPURITIES

##### • CHLORIDE AND SULFATE, *Chloride* <221>

**Standard:** 1.0 mL of 0.020 N hydrochloric acid

**Sample:** 1.0 g

**Acceptance criteria:** NMT 0.07%

##### • CHLORIDE AND SULFATE, *Sulfate* <221>

**Standard:** 1.0 mL of 0.020 N sulfuric acid

**Sample:** 2.0 g

**Acceptance criteria:** NMT 0.05%

##### • HEAVY METALS <231>

**Test preparation:** Dissolve 1 g in 25 mL of water.

**Acceptance criteria:** NMT 20 ppm

##### • REDUCING SUGARS

**Sample:** 0.50 g

**Analysis:** Dissolve the *Sample* in 10 mL of hot water, add 2 mL of 3 N hydrochloric acid, boil for about 2 min, and cool. Add 5 mL of sodium carbonate TS, allow to stand for 5 min, dilute with water to 20 mL, and filter. Add 5 mL of the clear filtrate to 2 mL of alkaline cupric tartrate TS, and boil for 1 min.

**Acceptance criteria:** No red precipitate is formed immediately.

#### SPECIFIC TESTS

##### • PH <791>

**Sample solution:** 100 mg/mL

**Acceptance criteria:** 6.0–8.0

##### • LOSS ON DRYING <731>

(See *Thermal Analysis* <891>.)

[NOTE—The quantity taken for the determination may be adjusted, if necessary, for instrument sensitivity. Weight loss occurring at temperatures above about 160°, indicative of decomposition, is not to be interpreted as *Loss on Drying*.]

**Sample:** 10–25 mg

**Analysis:** Determine the percentage of volatile substances by thermogravimetric analysis on an appropriately calibrated instrument. Heat the specimen under test at a rate of 5°/min in an atmosphere of nitrogen, at a flow rate of 40 mL/min. Record the thermogram to 150°.

**Acceptance criteria:** See *Table 1*.

Table 1

Form	Loss on Drying (%)
Anhydrous	NMT 1.0
2H <sub>2</sub> O (dihydrate)	NMT 6.9
3 1/2 H <sub>2</sub> O	NMT 11.4

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **LABELING:** Label to indicate whether hydrous or anhydrous; if hydrous, label to indicate also the degree of hydration.

##### • USP REFERENCE STANDARDS <11>

USP Calcium Gluceptate RS

## Calcium Gluceptate Injection

» Calcium Gluceptate Injection is a sterile solution of Calcium Gluceptate in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of calcium (Ca).

**Packaging and storage—**Preserve in tight, single-dose containers, preferably of Type I or Type II glass.

**Labeling—**The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

##### USP Reference standards <11>—

USP Calcium Gluceptate RS

USP Endotoxin RS

##### Identification—

**A: Infrared Absorption <197K>—**Prepare the test specimen as follows. Transfer 5 mL of Injection to a separator, add 10 mL of chloroform, shake, and allow the layers to separate. Draw off and discard the chloroform layer, and repeat the extraction with a second 10-mL portion of chloroform. Drain the water layer into a small beaker, evaporate to dryness, and dry in vacuum at 60° for 16 hours.

**B:** A dilution of the Injection with water (1 in 5) responds to the tests for *Calcium* <191>.

**Bacterial endotoxins <85>—**It contains not more than 0.32 USP Endotoxin Unit per mg of calcium gluceptate.

**pH <791>:** between 5.6 and 7.0.

**Particulate matter <788>:** meets the requirements for small-volume injections.

**Other requirements—**It meets the requirements under *Injections* <1>.

**Assay—**To an accurately measured volume of Injection, equivalent to about 45 mg of calcium, add 2 mL of 3 N hydrochloric acid and 148 mL of water. While stirring, preferably with a magnetic stirrer, add about 15 mL of 0.05 M edetate disodium VS from a 50-mL buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 2.004 mg of calcium (Ca).

## Calcium Gluconate

$C_{12}H_{22}CaO_{14}$

430.37

$C_{12}H_{22}CaO_{14} \cdot H_2O$

448.39

D-Gluconic acid, calcium salt (2:1);  
Calcium D-gluconate (1:2) [299-28-5].  
Monohydrate [18016-24-5].

**DEFINITION**

Calcium Gluconate is anhydrous or contains one molecule of water of hydration. The anhydrous form contains NLT 98.0% and NMT 102.0% of calcium gluconate ( $C_{12}H_{22}CaO_{14}$ ), calculated on the dried basis. The monohydrate form contains NLT 99.0% and NMT 101.0% of calcium gluconate monohydrate ( $C_{12}H_{22}CaO_{14} \cdot H_2O$ ) where labeled as intended for use in preparing injectable dosage forms, and NLT 98.5% and NMT 102.0% of calcium gluconate monohydrate ( $C_{12}H_{22}CaO_{14} \cdot H_2O$ ) where labeled as not intended for use in preparing injectable dosage forms.

**IDENTIFICATION**

- **A. IDENTIFICATION TESTS—GENERAL**, *Calcium* <191>: A 20 mg/mL solution meets the requirements.
- **B. THIN-LAYER CHROMATOGRAPHY**  
**Standard solution:** 10 mg/mL of USP Potassium Gluconate RS  
**Sample solution:** 10 mg/mL of Calcium Gluconate, heating in a water bath at 60°, if necessary, to dissolve  
**Chromatographic system**  
 (See *Chromatography* <621>, *Thin-Layer Chromatography*).  
**Mode:** TLC  
**Adsorbent:** 0.25-mm layer of chromatographic silica gel  
**Application volume:** 5  $\mu$ L  
**Developing solvent system:** Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)  
**Spray reagent:** Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask. Add 1.0 g of ceric sulfate, swirl to dissolve, dilute with 2 N sulfuric acid to volume, and mix.  
**Analysis**  
**Samples:** *Standard solution* and *Sample solution*  
 Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, and spray with the *Spray reagent*. Heat the plate at 110° for about 10 min.  
**Acceptance criteria:** The principal spot of the *Sample solution* corresponds in color, size, and  $R_f$  value to that of the *Standard solution*.

**ASSAY**

- **PROCEDURE**  
**Sample:** 800 mg of Calcium Gluconate  
**Blank:** 150 mL of water containing 2 mL of 3 N hydrochloric acid  
**Titrimetric system**  
 (See *Titrimetry* <541>).  
**Mode:** Direct titration  
**Titrant:** 0.05 M edetate disodium VS  
**Endpoint detection:** Visual  
**Analysis:** Dissolve the *Sample* in 150 mL of water containing 2 mL of 3 N hydrochloric acid. While stirring, add 30 mL of *Titrant* from the titration buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue endpoint. Perform the *Blank* determination. Calculate the percentage of calcium gluconate ( $C_{12}H_{22}CaO_{14}$ ) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times M \times F]/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)  
 $V_B$  = *Titrant* volume consumed by the *Blank* (mL)  
 $M$  = *Titrant* molarity (mM/mL)  
 $F$  = equivalency factor, 430.4 mg/mM  
 $W$  = *Sample* weight (mg)

**Acceptance criteria:** Anhydrous form, 98.0%–102.0% on the dried basis; monohydrate form, 99.0%–101.0% where labeled as intended for use in preparing injectable dosage forms; and monohydrate form, 98.5%–102.0% where labeled as not intended for use in preparing injectable dosage forms

**IMPURITIES**

- **ARSENIC**, *Method I* <211>  
**Test preparation:** Dissolve 1.0 g in a mixture of 10 mL of hydrochloric acid and 20 mL of water, and dilute with water to 55 mL.  
**Analysis:** Proceed as directed in the chapter, except to omit the addition of 20 mL of 7 N sulfuric acid.  
**Acceptance criteria:** NMT 3 ppm
- **CHLORIDE AND SULFATE**, *Chloride* <221>: A 1.0-g portion shows no more chloride than corresponds to 0.07 mL of 0.020 N hydrochloric acid (0.005%). Where it is labeled as not intended for use in the preparation of injectable dosage forms, a 1.0-g portion shows no more chloride than corresponds to 1 mL of 0.020 N hydrochloric acid (0.07%).
- **CHLORIDE AND SULFATE**, *Sulfate* <221>: A 2.0-g portion dissolved in boiling water shows no more sulfate than corresponds to 0.1 mL of 0.020 N sulfuric acid (0.005%). Where it is labeled as not intended for use in the preparation of injectable dosage forms, a 2.0-g portion dissolved in boiling water shows no more sulfate than corresponds to 1 mL of 0.020 N sulfuric acid (0.05%).
- **HEAVY METALS**, *Method II* <231>: NMT 10 ppm; NMT 20 ppm where Calcium Gluconate is labeled as not intended for use in the preparation of injectable dosage forms
- **LIMIT OF IRON**

[NOTE—Calcium Gluconate labeled as not intended for use in the preparation of injectable dosage forms is exempt from this requirement.]

**Standard solutions:** 0.2, 0.4, and 1.0  $\mu$ g/mL of iron, prepared as follows. Separately transfer 2.0, 4.0, and 10.0 mL of *Standard Iron Solution*, prepared as directed under *Iron* <241>, to individual 100-mL volumetric flasks, each containing 1.37 g of calcium chloride, previously tested and shown to contain less than 5 ppm of iron, and dilute with 2 N hydrochloric acid to volume.

**Sample solution:** Transfer 1.0 g of Calcium Gluconate to a 100-mL quartz glass flask. Add 20 mL of 12 N nitric acid, and heat to boiling until fumes are evolved. Add 0.5 mL of 30% hydrogen peroxide, and heat again until fumes are evolved. Repeat this process until the volume is reduced to about 5 mL. Cool, add 1.0 mL of perchloric acid, and heat to boiling. [CAUTION—Do not heat above 190° or evaporate to dryness because of danger of explosion.] Transfer this solution to a 25-mL volumetric flask, and dilute with 2 N hydrochloric acid to volume.

**Blank solution:** Use 0.34 g of calcium chloride, previously tested and shown to contain less than 5 ppm of iron, instead of Calcium Gluconate, and prepare as directed under *Sample solution*.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 248.3 nm

**Lamp:** Iron hollow-cathode

**Flame:** Air-acetylene

**Analysis**

**Samples:** *Standard solutions*, *Sample solution*, and *Blank solution*

Determine the absorbances of the *Standard solutions* and the *Sample solution*, using the *Blank solution* as the blank and making deuterium background corrections. Plot the absorbances of the *Standard solutions* versus concentration, in  $\mu$ g/mL, of iron, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration,  $C$ , in  $\mu$ g/mL, of iron in the *Sample solution*.

Calculate the concentration of iron, in ppm, in the portion of Calcium Gluconate taken:

$$\text{Result} = (C \times V)/W$$

- C = concentration of iron in the *Sample solution* obtained from the regression equation ( $\mu\text{g/mL}$ )  
 V = volume of *Sample solution* (mL)  
 W = weight of Calcium Gluconate taken to prepare the *Sample solution* (g)

**Acceptance criteria:** NMT 5 ppm

• **LIMIT OF MAGNESIUM AND ALKALI METALS**

[NOTE—Calcium Gluconate labeled as not intended for use in preparing injectable dosage forms is exempt from this requirement.]

**Sample:** 1.0 g

**Analysis:** Dissolve completely the *Sample* in 100 mL of boiling water. Add 10 mL of ammonium chloride TS, 1 mL of ammonium hydroxide, and 50 mL of hot (maintained at 70°–80°) ammonium oxalate TS. Allow to stand for 4 h, dilute with water to 200 mL, and filter. Evaporate 100 mL of the filtrate to dryness, and ignite to constant weight.

**Acceptance criteria:** NMT 0.4%: The weight of the residue does not exceed 2 mg.

• **LIMIT OF PHOSPHATE**

[NOTE—Calcium Gluconate labeled as not intended for use in the preparation of injectable dosage forms is exempt from this requirement.]

**Standard stock solution 1:** 0.716 mg/mL of monobasic potassium phosphate

**Standard stock solution 2:** Dilute 1.0 mL of *Standard stock solution 1* with water to 100 mL.

**Standard solution:** Dilute 2.0 mL of *Standard stock solution 2* with water to 100 mL.

**Sample stock solution:** To 10.0 g of Calcium Gluconate add 90 mL of hot water (70°–80°), and heat to boiling, with swirling, for 10 s to obtain a clear solution.

**Sample solution:** Dilute 1 mL of the hot *Sample stock solution* with water to 100 mL.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 To the *Standard solution* and *Sample solution* add 4 mL of sulfomolybdic acid TS, and mix. To both solutions add 0.1 mL of a freshly prepared mixture of 3 N hydrochloric acid and stronger acid stannous chloride TS (10:1), and mix.

**Acceptance criteria:** NMT 0.01%: After 10 min any color in the *Sample solution* is not more intense than that in the *Standard solution*.

• **LIMIT OF OXALATE**

[NOTE—Calcium Gluconate labeled as not intended for use in the preparation of injectable dosage forms is exempt from this requirement.]

[NOTE—Use deionized water where water is indicated.]

**Mobile phase:** 0.0017 M sodium bicarbonate and 0.0018 M sodium carbonate in water

**Solution A:** 0.0125 M sulfuric acid in water

**Solution B:** Dilute 1 mL of hydrochloric acid with water to 1200 mL.

**Standard solution:** 1.5  $\mu\text{g/mL}$  of sodium oxalate in *Solution B*

**Sample solution:** 20 mg/mL of Calcium Gluconate in *Solution B*. Sonicate if necessary.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** Ion chromatography

**Detector:** Conductance

**Columns**

**Analytical:** 4-mm  $\times$  25-cm; 15- $\mu\text{m}$  packing L12

**Guard:** 4-mm  $\times$  5-cm; 15- $\mu\text{m}$  packing L12

**Anion suppressor:** Micromembrane anion suppressor column connected in series with the guard and analytical columns. The anion suppressor column is equipped with a micromembrane that separates the *Mobile phase* from the *Solution A* flowing counter-current to the *Mobile phase* at a rate of about 7 mL/min.

[NOTE—Condition the system for about 15 min with *Mobile phase* at a flow rate of 2 mL/min.]

**Flow rate:** 2 mL/min

**Injection size:** 50  $\mu\text{L}$

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 2500 theoretical plates

**Tailing factor:** NMT 1.2

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of oxalate in the portion of Calcium Gluconate taken:

$$\text{Result: } (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times F \times 100$$

$r_U$  = peak response for oxalate from the *Sample solution*

$r_S$  = peak response for oxalate from the *Standard solution*

$C_S$  = concentration of sodium oxalate in the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = concentration of Calcium Gluconate in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of oxalate, 88.03

$M_{r2}$  = molecular weight of sodium oxalate, 134.00

$F$  = conversion factor, 0.001 mg/ $\mu\text{g}$

**Acceptance criteria:** NMT 0.01%

• **REDUCING SUBSTANCES**

**Sample:** 1.0 g of Calcium Gluconate

**Blank:** 20 mL of water

**Titrimetric system**

(See *Titrimetry* <541>.)

**Mode:** Residual titration

**Titrant:** 0.1 N iodine VS

**Back titrant:** 0.1 N sodium thiosulfate VS

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* to a 250-mL conical flask, dissolve in 20 mL of hot water, cool, and add 25 mL of alkaline cupric citrate TS. Cover the flask, boil gently for 5 min, accurately timed, and cool rapidly to room temperature. Add 25 mL of 0.6 N acetic acid, 10.0 mL of *Titrant*, and 10 mL of 3 N hydrochloric acid, and titrate with the *Back titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform the *Blank* determination.

Calculate the percentage of reducing substances (as dextrose) in the *Sample* taken:

$$\text{Result} = \{(V_B - V_S) \times N \times F\} / W \times 100$$

$V_B$  = *Back titrant* volume consumed by the *Blank* (mL)

$V_S$  = *Back titrant* volume consumed by the *Sample* (mL)

$N$  = *Back titrant* normality (mEq/mL)

$F$  = equivalency factor, 27 mg/mEq

$W$  = *Sample weight* (mg)

**Acceptance criteria:** NMT 1.0%

**SPECIFIC TESTS**

- **LOSS ON DRYING** <731>: Dry a sample at 105° for 16 h: the anhydrous form loses NMT 3.0% of its weight; the monohydrate form, where labeled as intended for use in preparing injectable dosage forms, loses NMT 1.0% of its weight, and where labeled as not intended for use in preparing injectable dosage forms, loses NMT 2.0% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate whether it is anhydrous or monohydrate. Where the quantity of calcium gluconate is indicated in the labeling of any solution containing Calcium Gluconate, this shall be understood to be in terms of anhydrous calcium gluconate ( $\text{C}_{12}\text{H}_{22}\text{CaO}_{14}$ ).

Calcium Gluconate intended for use in preparing injectable dosage forms is so labeled. Calcium Gluconate not intended for use in preparing injectable dosage forms is so labeled; in addition, it may be labeled also as intended for use in preparing oral dosage forms.

- **USP REFERENCE STANDARDS** (11)  
USP Potassium Gluconate RS

## Calcium Gluconate Injection

» Calcium Gluconate Injection is a sterile solution of Calcium Gluconate in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of total Ca. The calcium is in the form of calcium gluconate, except that a small amount may be replaced with an equal amount of calcium in the form of Calcium Saccharate, or other suitable calcium salts, for the purpose of stabilization. It may contain sodium hydroxide added for adjustment of the pH.

Injection intended for veterinary use only may be prepared from Calcium Gluconate solubilized with Boric Acid, or from Glyconolactone, Boric Acid, and Calcium Carbonate.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

**Labeling**—Label the Injection to indicate its content, if any, of added calcium salts, calculated as percentage of calcium in the Injection. The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL. The labeling indicates that the Injection must be clear at the time of use, and that if crystallization has occurred, warming may redissolve the precipitate. Injection intended for veterinary use only is so labeled. If Injection contains Boric Acid, it is so labeled.

**USP Reference standards** (11)—

USP Endotoxin RS  
USP Potassium Gluconate RS

**Identification**—

**A:** A volume of Injection diluted, if necessary, with water to obtain a test solution of calcium gluconate (1 in 100) responds to Identification test *B* under *Calcium Gluconate*.

**B:** A dilution of the Injection with water (1 in 5) responds to the tests for *Calcium* (191).

**Bacterial endotoxins** (85)—It contains not more than 0.17 USP Endotoxin Unit per mg of calcium gluconate.

**pH** (791): between 6.0 and 8.2, except that in the case where it is labeled as intended for veterinary use only and as containing boric acid, it is between 2.5 and 4.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—To an accurately measured volume of Injection, equivalent to about 500 mg of calcium gluconate, add 2 mL of 3 N hydrochloric acid, and dilute with water to 150 mL. While stirring, preferably with a magnetic stirrer, add about 20 mL of 0.05 M edetate disodium VS from a 50-mL buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue

endpoint. Each mL of 0.05 M edetate disodium is equivalent to 2.004 mg of calcium (Ca).

## Calcium Gluconate Tablets

### DEFINITION

Calcium Gluconate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of calcium gluconate ( $C_{12}H_{22}CaO_{14}$ ).

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, *Calcium* (191)

**Sample stock solution:** A warm, filtered solution in water, equivalent to 100 mg/mL of calcium gluconate from powdered Tablets

**Sample solution:** Equivalent to 20 mg/mL of calcium gluconate from a dilution of the *Sample stock solution*

**Acceptance criteria:** Meet the requirements

- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

**Standard solution:** 10 mg/mL of USP Potassium Gluconate RS

**Sample solution:** Equivalent to 10 mg/mL of calcium gluconate from a dilution of the *Sample stock solution* obtained from *Identification* test A

**Chromatographic system**

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 5  $\mu$ L

**Developing solvent system:** Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)

**Spray reagent:** Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask, add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Develop until the solvent front has moved about three-fourths of the length of the plate. Remove the plate, and dry at 110° for 20 min. Allow to cool, and spray with *Spray reagent*. Heat the plate at 110° for about 10 min.

**Acceptance criteria:** The principal spot of the *Sample solution* corresponds in color, size, and  $R_f$  value to that of the *Standard solution*.

### ASSAY

- **PROCEDURE**

**Sample:** A portion of the powder from NLT 20 finely powdered Tablets, equivalent to 500 mg of calcium gluconate

**Blank:** Proceed as directed in the *Analysis*, without the *Sample*.

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Indicator:** Hydroxy naphthol blue, 300 mg

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* to a suitable crucible. Ignite, gently at first, until free from carbon. Cool the crucible. Add 10 mL of water, and dissolve the residue by adding sufficient 3 N hydrochloric acid, dropwise, to achieve complete solution. Transfer the solution to a suitable container, and add about 150 mL of water. While stirring, preferably with a magnetic stirrer, add 20 mL of *Titrant* from a 50-mL buret. Add 15 mL of 1 N sodium hydroxide, then add the *Indicator*. Continue the titration to a blue endpoint. Perform a *Blank* determination.

Calculate the percentage of the labeled amount of calcium gluconate ( $C_{12}H_{22}CaO_{14}$ ) in the portion of Tablets taken:

$$\text{Result} = \{(V_s - V_b) \times M \times F / W\} \times 100$$

$V_s$  = Titrant volume consumed by the Sample (mL)  
 $V_b$  = Titrant volume consumed by the Blank (mL)  
 $M$  = actual molarity of the Titrant (mM/mL)  
 $F$  = equivalency factor, 430.4 (mg/mM)  
 $W$  = nominal weight of calcium gluconate in the Sample (mg)

Acceptance criteria: 95.0%–105.0%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: Solution having a known concentration of calcium in Medium

Sample solution: Filtered portion of the solution under test, suitably diluted with Medium if necessary

### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 422.8 nm

Lamp: Calcium hollow-cathode

Flame: Air-acetylene

### Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of calcium gluconate ( $C_{12}H_{22}CaO_{14}$ ) dissolved:

$$\text{Result} = (A_u/A_s) \times (C_s \times D \times V/L) \times (M_r/A_r) \times 100$$

$A_u$  = absorbance of the Sample solution

$A_s$  = absorbance of the Standard solution

$C_s$  = concentration of calcium in the Standard solution (mg/mL)

$D$  = dilution factor for the Sample solution

$V$  = volume of Medium, 900 mL

$L$  = label claim (mg/Tablet)

$M_r$  = molecular weight of calcium gluconate, 430.4

$A_r$  = atomic weight of calcium, 40.078

Tolerances: NLT 75% (Q) of the labeled amount of calcium gluconate ( $C_{12}H_{22}CaO_{14}$ ) is dissolved.

### • UNIFORMITY OF DOSAGE UNITS <905>: Meet the requirements

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** <11>  
 USP Potassium Gluconate RS

## Calcium Hydroxide

$Ca(OH)_2$  74.09

Calcium hydroxide.

Calcium hydroxide [1305-62-0].

» Calcium Hydroxide contains not less than 95.0 percent and not more than 100.5 percent of  $Ca(OH)_2$ .

**Packaging and storage**—Preserve in tight containers.

### Identification—

A: When mixed with from three to four times its weight of water, it forms a smooth magma. The clear, supernatant from the magma is alkaline to litmus.

B: Mix 1 g with 20 mL of water, and add sufficient 6 N acetic acid to effect solution: the resulting solution responds to the tests for Calcium <191>.

**Limit of acid-insoluble substances**—Dissolve 2.0 g in 30 mL of 4 N hydrochloric acid, and heat to boiling. Filter the mixture, wash the residue with hot water, and ignite: the weight of the residue does not exceed 10 mg (0.5%).

**Carbonate**—Mix 2 g with 50 mL of water: the addition of an excess of 3 N hydrochloric acid to the mixture does not cause more than a slight effervescence.

**Heavy metals** <231>—Dissolve 2.0 g in 20 mL of 3 N hydrochloric acid, and evaporate on a steam bath to dryness. Dissolve the residue in 20 mL of water, and filter. Dilute the filtrate with water to 40 mL, and to 20 mL of the resulting solution add 1 mL of 0.1 N hydrochloric acid, then add water to make 25 mL: the limit is 20 µg per g.

**Limit of magnesium and alkali salts**—Dissolve 0.50 g in a mixture of 30 mL of water and 10 mL of 3 N hydrochloric acid, and proceed as directed in the test for *Magnesium and alkali salts* under *Calcium Carbonate*, beginning with "heat the solution, and boil for 1 minute." The weight of the residue does not exceed 12 mg (4.8%).

**Assay**—Transfer about 1.5 g of Calcium Hydroxide, accurately weighed, to a beaker, and gradually add 30 mL of 3 N hydrochloric acid. When the solution is dissolved, transfer it to a 500-mL volumetric flask, rinse the beaker thoroughly, adding the rinsings to the flask, dilute with water to volume, and mix. Pipet 50 mL of the solution into a suitable container, add 100 mL of water, 15 mL of 1 N sodium hydroxide, and 300 mg of hydroxy naphthol blue, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 3.705 mg of  $Ca(OH)_2$ .

## Calcium Hydroxide Topical Solution

» Calcium Hydroxide Topical Solution is a solution containing, in each 100 mL, not less than 140 mg of calcium hydroxide [ $Ca(OH)_2$ ].

Prepare Calcium Hydroxide Topical Solution as follows (see *Pharmaceutical Compounding—Non-sterile Preparations* <795>):

Calcium Hydroxide .....	3 g
Purified Water .....	1000 mL

Add the Calcium Hydroxide to 1000 mL of cool Purified Water, and agitate the mixture vigorously and repeatedly during 1 hour. Allow the excess calcium hydroxide to settle. Dispense only the clear supernatant.

NOTE—The solubility of calcium hydroxide, which varies with the temperature at which the solution is stored, is about 170 mg per 100 mL at 15° and less at a higher temperature. The official concentration is based upon a temperature of 25°.

The undissolved portion of the mixture is not suitable for preparing additional quantities of Calcium Hydroxide Topical Solution.

**Packaging and storage**—Preserve in well-filled, tight containers, at a temperature not exceeding 25°.

**Identification—**

**A:** It absorbs carbon dioxide from the air, a film of calcium carbonate forming on the surface of the liquid.

**B:** When heated, it becomes turbid, owing to the separation of calcium hydroxide.

**C:** It responds to the tests for *Calcium* <191>.

**Alkalies and their carbonates—**A portion of it, saturated with carbon dioxide and subsequently boiled, is neutral in reaction.

**Assay—**Pipet 100 mL of Topical Solution into a suitable container, add 50 mL of water, 15 mL of 1 N sodium hydroxide, and 300 mg of hydroxy naphthol blue, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 3.705 mg of calcium hydroxide  $[\text{Ca}(\text{OH})_2]$ .

## Calcium Lactate

$\text{C}_6\text{H}_{10}\text{CaO}_6 \cdot 5\text{H}_2\text{O}$  308.30

$\text{C}_6\text{H}_{10}\text{CaO}_6$  218.22

Propanoic acid, 2-hydroxy-, calcium salt (2:1), hydrate;

Calcium lactate (1:2) hydrate [41372-22-9].

Calcium lactate (1:2) pentahydrate [5743-47-5].

Anhydrous [814-80-2].

**DEFINITION**

Calcium Lactate contains NLT 98.0% and NMT 101.0% of calcium lactate ( $\text{C}_6\text{H}_{10}\text{CaO}_6$ ), calculated on the dried basis.

**IDENTIFICATION**

• **A. IDENTIFICATION TESTS—GENERAL,** *Calcium* <191>: Meets the requirements

• **B. INFRARED ABSORPTION** <197K>

**ASSAY****• PROCEDURE**

**Sample:** Weighed portion of Calcium Lactate equivalent to 350 mg of  $\text{C}_6\text{H}_{10}\text{CaO}_6$

**Blank:** 150 mL of water and 2 mL of 3 N hydrochloric acid

**Titrimetric system**

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in a mixture of water and 3 N hydrochloric acid (150:2). While stirring with a magnetic stirrer, add 30 mL of *Titrant* from the titration buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue endpoint. Perform the *Blank* determination.

Calculate the percentage of calcium lactate ( $\text{C}_6\text{H}_{10}\text{CaO}_6$ ) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times M \times F]/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$M$  = *Titrant* molarity (mM/mL)

$F$  = equivalency factor, 218.2 mg/mM

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 98.0%–101.0% on the dried basis

**IMPURITIES****• HEAVY METALS** <231>

**Test preparation:** Dissolve 1 g in 2.5 mL of 1 N acetic acid, and dilute with water to 25 mL.

**Acceptance criteria:** NMT 20 ppm

**• LIMIT OF MAGNESIUM AND ALKALI SALTS**

**Sample:** 1.0 g Calcium Lactate

**Analysis:** Mix the *Sample* with 40 mL of water, carefully add 1 mL of hydrochloric acid, and heat the solution to boiling. Rapidly add 40 mL of oxalic acid TS, and stir vigorously until precipitation is well established. Add immediately to the warm mixture 2 drops of methyl red TS and then 6 N ammonium hydroxide, dropwise, until the mixture is just alkaline. Cool to room temperature, transfer to a 100-mL graduated cylinder, dilute with water to 100 mL, mix, and allow to stand for 4 h or overnight. Filter, and to 50 mL of the clear filtrate in a platinum dish add 0.5 mL of sulfuric acid. Evaporate the mixture on a steam bath to a small volume. Carefully heat over a free flame to dryness, and continue heating to complete decomposition and volatilization of ammonium salts. Finally, ignite the residue to constant weight.

**Acceptance criteria:** NMT 1.0%: The weight of the residue does not exceed 5.0 mg.

**• VOLATILE FATTY ACID**

**Sample solution:** Stir 500 mg of Calcium Lactate with 1 mL of sulfuric acid, and warm.

**Acceptance criteria:** The mixture does not emit an odor of volatile fatty acid.

**SPECIFIC TESTS****• ACIDITY**

**Sample solution:** 50 mg/mL

**Analysis:** Titrate 20 mL of *Sample solution* with 0.10 N sodium hydroxide, using phenolphthalein TS as the indicator.

**Acceptance criteria:** NMT 0.50 mL is required for neutralization, equivalent to NMT 0.45% as lactic acid.

**• LOSS ON DRYING** <731>

**Sample:** 1–2 g

**Analysis:** Distribute the *Sample* evenly in a suitable weighing dish to a depth of NMT 3 mm, and dry at 120° for 4 h.

**Acceptance criteria:** See *Table 1*.

**Table 1**

Form	Loss on Drying (%)
Pentahydrate	22.0–27.0
Trihydrate	15.0–20.0
Monohydrate	5.0–8.0
Anhydrous	NMT 3.0

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **LABELING:** The label indicates whether it is the dried form or is hydrous; if the latter, the label indicates the degree of hydration. Where the quantity of Calcium Lactate is indicated in the labeling of any solution containing Calcium Lactate, this shall be understood to be in terms of calcium lactate pentahydrate ( $\text{C}_6\text{H}_{10}\text{CaO}_6 \cdot 5\text{H}_2\text{O}$ ).

• **USP REFERENCE STANDARDS** <11>

USP Calcium Lactate RS

## Calcium Lactate Tablets

### DEFINITION

Calcium Lactate Tablets contain NLT 94.0% and NMT 106.0% of the labeled amount of calcium lactate pentahydrate ( $C_6H_{10}CaO_6 \cdot 5H_2O$ ).

[NOTE—An equivalent amount of Calcium Lactate with less water of hydration may be used in place of calcium lactate pentahydrate ( $C_6H_{10}CaO_6 \cdot 5H_2O$ ) in preparing Calcium Lactate Tablets.]

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Calcium (191)**  
**Sample solution:** A filtered solution, equivalent to 50 mg/mL of calcium lactate pentahydrate from powdered Tablets  
**Acceptance criteria:** Meet the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Lactate (191)**  
**Sample solution:** A filtered solution, equivalent to 50 mg/mL of calcium lactate pentahydrate from powdered Tablets  
**Acceptance criteria:** Meet the requirements

### ASSAY

#### • PROCEDURE

**Sample:** A portion of the powder from NLT 20 finely powdered Tablets, equivalent to 350 mg of calcium lactate pentahydrate ( $C_6H_{10}CaO_6 \cdot 5H_2O$ )

**Blank:** Proceed as directed in the *Analysis* without the *Sample*.

#### Titrimetric system

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Indicator:** Hydroxy naphthol blue, 300 mg

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* to a suitable container, and add 150 mL of water and 2 mL of 3 N hydrochloric acid. Stir, using a magnetic stirrer, for 3–5 min. While stirring, add 30 mL of *Titrant* from a 50-mL buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue endpoint. Perform a *Blank* determination.

Calculate the percentage of the labeled amount of calcium lactate pentahydrate ( $C_6H_{10}CaO_6 \cdot 5H_2O$ ) in the portion of Tablets taken:

$$\text{Result} = \left\{ \frac{(V_S - V_B) \times M \times F}{W} \right\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$M$  = actual molarity of the *Titrant* (mM/mL)

$F$  = equivalency factor, 308.4 (mg/mM)

$W$  = nominal weight of calcium lactate pentahydrate in the *Sample* taken (mg)

**Acceptance criteria:** 94.0%–106.0%

### PERFORMANCE TESTS

- **DISSOLUTION, Procedure for a Pooled Sample (711)**  
**Medium:** Water; 500 mL  
**Apparatus 1:** 100 rpm  
**Time:** 45 min  
**Analysis:** Determine the amount of calcium lactate pentahydrate ( $C_6H_{10}CaO_6 \cdot 5H_2O$ ) dissolved, as directed in the *Assay*, making any necessary modifications.  
**Tolerances:** NLT 75% (Q) of the labeled amount of calcium lactate pentahydrate ( $C_6H_{10}CaO_6 \cdot 5H_2O$ ) is dissolved.
- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** The quantity of Calcium Lactate stated in the labeling is in terms of calcium lactate pentahydrate.

## Calcium Lactobionate

$C_{24}H_{42}CaO_{24} \cdot 2H_2O$  790.68  
D-Gluconic acid, 4-O-β-D-galactopyranosyl-, calcium salt (2:1), dihydrate;  
Lactobionic acid, calcium salt (2:1), dihydrate;  
Calcium lactobionate (1:2), dihydrate [110638-68-1].

### DEFINITION

Calcium Lactobionate contains NLT 96.0% and NMT 102.0% of calcium lactobionate ( $C_{24}H_{42}CaO_{24} \cdot 2H_2O$ ).

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Calcium (191):** A 20 mg/mL solution meets the requirements.
- **B. INFRARED ABSORPTION (197K)**
- **C. THIN LAYER CHROMATOGRAPHY**  
**Standard solution:** 10 mg/mL of USP Calcium Lactobionate RS in water  
**Sample solution:** 10 mg/mL of Calcium Lactobionate in water  
**Chromatographic system**  
(See *Chromatography* (621), *Thin-Layer Chromatography*.)  
**Mode:** TLC  
**Adsorbent:** 0.25-mm layer of chromatographic silica gel  
**Application volume:** 5 μL  
**Developing solvent system:** Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)  
**Spray reagent:** Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask. Add 1.0 g of ceric sulfate, swirl to dissolve, dilute with 2 N sulfuric acid to volume, and mix.

#### Analysis:

**Samples:** *Standard solution* and *Sample solution*  
Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 100° for 20 min. Allow to cool, and spray with the *Spray reagent*. Heat the plate at 110° for about 10 min.

**Acceptance criteria:** The principal spot of the *Sample solution* corresponds in color, size, and  $R_f$  value to that of the *Standard solution*.

### ASSAY

#### • PROCEDURE

**Sample:** 800 mg of Calcium Lactobionate

**Blank:** 150 mL of water and 2 mL of 3 N hydrochloric acid

#### Titrimetric system

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in a mixture of water and 3 N hydrochloric acid (150:2). While stirring with a magnetic stirrer, add 15 mL of *Titrant* from the titration buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the

titration to a blue endpoint. Perform the *Blank* determination.  
Calculate the percentage of calcium lactobionate ( $C_{24}H_{42}CaO_{24} \cdot 2H_2O$ ) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times M \times F]/W\} \times 100$$

- $V_S$  = Titrant volume consumed by the *Sample* (mL)  
 $V_B$  = Titrant volume consumed by the *Blank* (mL)  
 $M$  = Titrant molarity (mM/mL)  
 $F$  = equivalency factor, 790.7 mg/mmol  
 $W$  = *Sample* weight (mg)  
 Acceptance criteria: 96.0%–102.0%

## IMPURITIES

### • HALIDES

**Standard solution:** 0.7 mL of 0.020 N hydrochloric acid  
**Sample:** 1.2 g  
**Analysis:** Proceed as directed for *Chloride and Sulfate* <221>, *Chloride*.

**Acceptance criteria:** NMT 0.04%

### • CHLORIDE AND SULFATE, *Sulfate* <221>

**Standard solution:** 1 mL of 0.020 N sulfuric acid  
**Sample:** 2.0 g

**Analysis:** Dissolve the *Sample* in boiling water.

**Acceptance criteria:** NMT 0.05%

### • HEAVY METALS <231>

**Test preparation:** Mix 1 g in 4 mL of 1.2 N hydrochloric acid. Add water to make 25 mL, warm gently until dissolved, and cool to room temperature.

**Acceptance criteria:** NMT 20 ppm

### • REDUCING SUBSTANCES

**Sample:** 1.0 g of Calcium Lactobionate

**Blank:** 20 mL of water

**Titrimetric system**

(See *Titrimetry* <541>.)

**Mode:** Residual titration

**Titrant:** 0.1 N iodine VS

**Back-titrant:** 0.1 N sodium thiosulfate VS

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* to a 250-mL conical flask, dissolve in the *Blank*, and add 25 mL of alkaline cupric citrate TS. Cover the flask, boil gently for 5 min, accurately timed, and cool rapidly to room temperature. Add 25 mL of 0.6 N acetic acid, 10.0 mL of *Titrant*, and 10 mL of 3 N hydrochloric acid, and titrate with *Back-titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform the *Blank* determination.

Calculate the percentage of reducing substances (as dextrose) in the *Sample* taken:

$$\text{Result} = \{[(V_B - V_S) \times N \times F]/W\} \times 100$$

- $V_B$  = Back-titrant volume consumed by the *Blank* (mL)  
 $V_S$  = Back-titrant volume consumed by the *Sample* (mL)  
 $N$  = Back-titrant normality (mEq/mL)  
 $F$  = equivalency factor, 27 mg/mEq  
 $W$  = *Sample* weight (mg)  
 Acceptance criteria: NMT 1.0%

## SPECIFIC TESTS

### • OPTICAL ROTATION, *Specific Rotation* <781S>

**Sample solution:** 100 mg/mL

**Acceptance criteria:** +22.0° to +26.5°

### • pH <791>

**Sample solution:** 50 mg/mL

**Acceptance criteria:** 5.4–7.4

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS <11>**  
USP Calcium Lactobionate RS

## Calcium Levulinate

$C_{10}H_{14}CaO_6 \cdot 2H_2O$  306.32

$C_{10}H_{14}CaO_6$  270.30

Pentanoic acid, 4-oxo-, calcium salt (2:1), dihydrate;  
 Calcium levulinate (1:2) dihydrate [5743-49-7].

Anhydrous [591-64-0].

## DEFINITION

Calcium Levulinate contains NLT 97.5% and NMT 100.5% of calcium levulinate ( $C_{10}H_{14}CaO_6$ ), calculated on the dried basis.

## IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, *Calcium* <191>:** A 100 mg/mL solution meets the requirements.

### • B.

**Sample solution:** 0.5 g in 5 mL of water

**Analysis:** To the *Sample solution* add 5 mL of 1 N sodium hydroxide, and filter. To the filtrate add 5 mL of iodine TS.

**Acceptance criteria:** A precipitate of iodoform is produced.

## ASSAY

### • PROCEDURE

**Sample:** 600 mg of Calcium Levulinate

**Blank:** 150 mL of water containing 2 mL of 3 N hydrochloric acid

**Titrimetric system**

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in 150 mL of water containing 2 mL of 3 N hydrochloric acid. While stirring with a magnetic stirrer, add 30 mL of *Titrant* from the titration buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration to a blue endpoint. Perform the *Blank* determination.

Calculate the percentage of calcium levulinate ( $C_{10}H_{14}CaO_6$ ) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times M \times F]/W\} \times 100$$

- $V_S$  = Titrant volume consumed by the *Sample* (mL)  
 $V_B$  = Titrant volume consumed by the *Blank* (mL)  
 $M$  = Titrant molarity (mM/mL)  
 $F$  = equivalency factor, 270.3 mg/mmol  
 $W$  = *Sample* weight (mg)  
 Acceptance criteria: 97.5%–100.5% on the dried basis

## IMPURITIES

### • CHLORIDE AND SULFATE, *Chloride* <221>

**Standard:** 1.0 mL of 0.020 N hydrochloric acid

**Sample:** 1.0 g

**Acceptance criteria:** NMT 0.07%

### • CHLORIDE AND SULFATE, *Sulfate* <221>

**Standard:** 1.0 mL of 0.020 N sulfuric acid

**Sample:** 2.0 g

**Acceptance criteria:** NMT 0.05%

### • HEAVY METALS <231>: NMT 20 ppm

### • REDUCING SUGARS

**Sample:** 0.50 g

**Analysis:** Dissolve the *Sample* in 10 mL of water, add 2 mL of 3 N hydrochloric acid, boil for about 2 min, and cool. Add 5 mL of sodium carbonate TS, allow to

stand for 5 min, dilute with water to 20 mL, and filter. Add 5 mL of the clear filtrate to 2 mL of alkaline cupric tartrate TS, and boil for 1 min.

**Acceptance criteria:** No red precipitate is formed immediately.

#### SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, *Class I* (741): 119°–125°
- **PH** (791)  
Sample solution: 100 mg/mL  
Acceptance criteria: 7.0–8.5
- **LOSS ON DRYING** (731): Dry a sample at a pressure not exceeding 5 mm of mercury at 60° for 5 h: it loses 10.5%–12.0% of its weight.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

### Calcium Levulinate Injection

» Calcium Levulinate Injection is a sterile solution of Calcium Levulinate in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_{10}H_{14}CaO_6 \cdot 2H_2O$ .

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

#### USP Reference standards (11)—

USP Endotoxin RS

**Identification**—It responds to the *Identification* tests under *Calcium Levulinate*.

**Bacterial endotoxins** (85)—It contains not more than 35.70 USP Endotoxin Units per mg of calcium levulinate.

**pH** (791): between 6.0 and 8.0.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 600 mg of calcium levulinate, to a 400-mL beaker, add 2 mL of hydrochloric acid, and proceed as directed in the *Assay* under *Calcium Levulinate*, beginning with “While stirring with a magnetic stirrer.” Each mL of 0.05 M edetate disodium is equivalent to 15.32 mg of  $C_{10}H_{14}CaO_6 \cdot 2H_2O$ .

### Calcium Pantothenate

$C_{18}H_{32}CaN_2O_{10}$  476.53  
β-Alanine, *N*-(2,4-dihydroxy-3,3-dimethyl-1-oxobutyl)-, calcium salt (2:1), (*R*)-;

Calcium D-pantothenate (1:2) [137-08-6].

#### DEFINITION

Calcium Pantothenate is the calcium salt of the dextrorotatory isomer of pantothenic acid. It contains NLT 5.7% and NMT 6.0% of nitrogen (N), and NLT 8.2% and NMT 8.6% of calcium (Ca), both calculated on the dried basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. IDENTIFICATION TESTS—GENERAL**, *Calcium* (191): A 50-mg/mL solution meets the requirements.

#### COMPOSITION

- **NITROGEN DETERMINATION**, *Method I* (461)  
Sample: 500 mg  
Analysis: Proceed as directed in the chapter.  
Acceptance criteria: 5.7%–6.0% on the dried basis
- **CONTENT OF CALCIUM**  
Sample: 800 mg of Calcium Pantothenate  
Blank: 150 mL of water containing 2 mL of 3 N hydrochloric acid  
Titrimetric system  
(See *Titrimetry* (541).)  
Mode: Direct titration  
Titrant: 0.05 M edetate disodium VS  
Endpoint detection: Visual  
Analysis: Dissolve the *Sample* in 150 mL of water containing 2 mL of 3 N hydrochloric acid. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and titrate with *Titrant* to a distinct blue endpoint. Perform the *Blank* determination.  
Calculate the percentage of calcium (Ca) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times M \times F] / W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)  
 $V_B$  = *Titrant* volume consumed by the *Blank* (mL)  
 $M$  = actual molarity of the *Titrant* (mM/mL)  
 $F$  = equivalency factor, 40.08 mg/mM  
 $W$  = *Sample* weight (mg)

**Acceptance criteria:** 8.2%–8.6% on the dried basis

#### IMPURITIES

- **HEAVY METALS** (231)  
Test preparation: 1.0 g in 25 mL of water  
Acceptance criteria: NMT 20 ppm
- **ORDINARY IMPURITIES** (466)  
Standard solution: Use water as the solvent. Use USP Beta Alanine RS, in place of USP Calcium Pantothenate RS, as the Standard.  
Test solution: Use water as the solvent.  
Eluant: Alcohol and water (65:35)  
Visualization: 4  
Acceptance criteria: NMT 1.0%

#### SPECIFIC TESTS

- **OPTICAL ROTATION**, *Specific Rotation* (781S)  
Sample solution: 50 mg/mL in water  
Acceptance criteria: +25.0° to +27.5°
- **ALKALINITY**  
Sample: 1.0 g  
Analysis: Dissolve the *Sample* in 15 mL of carbon dioxide-free water in a small flask. As soon as the solution is complete, add 1.0 mL of 0.10 N hydrochloric acid, then add 0.05 mL of phenolphthalein TS.  
Acceptance criteria: No pink color is produced within 5 s.
- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 5.0% of its weight.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **USP REFERENCE STANDARDS** <11>  
USP Beta Alanine RS  
3-Aminopropionic acid.  
USP Calcium Pantothenate RS

## Calcium Pantothenate Tablets

### DEFINITION

Calcium Pantothenate Tablets contain NLT 95.0% and NMT 115.0% of the labeled amount of the dextrorotatory isomer of calcium pantothenate ( $C_{18}H_{32}CaN_2O_{10}$ ).

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Calcium** <191>  
**Sample solution:** Digest a quantity of powdered Tablets, equivalent to 150 mg of calcium pantothenate, with 15 mL of 1 N sodium hydroxide, and filter.  
**Acceptance criteria:** Meet the requirements
- **B.**  
**Sample solution:** 5 mL of the filtrate obtained in *Identification test A*  
**Analysis:** Add 5 mL of 1 N hydrochloric acid and 2 drops of ferric chloride TS to the *Sample solution*.  
**Acceptance criteria:** A strong yellow color is produced.

### ASSAY

#### Change to read:

- **▲CALCIUM PANTOTHENATE**  
**Buffer solution:** Dissolve 10.0 g of monobasic potassium phosphate in 2000 mL of water, and adjust with phosphoric acid to a pH of 3.5.  
**Mobile phase:** Methanol and *Buffer solution* (1:9)  
**System suitability solution:** 0.5 mg/mL of USP Calcium Pantothenate RS and 0.1 mg/mL of USP Racemic Panthenol RS in water  
**Standard solution:** 0.5 mg/mL of USP Calcium Pantothenate RS in water  
**Sample solution:** Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 50 mg of calcium pantothenate, to a 100-mL volumetric flask. Add 5 mL of methanol, and swirl the flask to disperse. Dilute with water to volume, mix, and filter.  
**Chromatographic system**  
(See *Chromatography* <621>, *System Suitability*.)  
**Mode:** LC  
**Detector:** UV 205 nm  
**Column:** 4.6-mm × 25-cm; 5-μm packing L1  
**Column temperature:** 50°  
**Flow rate:** 2 mL/min  
**Injection volume:** 25 μL  
**System suitability**  
**Sample:** *System suitability solution*  
[NOTE—The relative retention times for pantothenate and panthenol are 1.0 and 1.1, respectively.]  
**Suitability requirements**  
**Resolution:** NLT 1.5 between pantothenate and panthenol  
**Relative standard deviation:** NMT 2.0%  
**Analysis**  
**Samples:** *Standard solution* and *Sample solution*  
Measure the peak areas for calcium pantothenate. Calculate the percentage of the labeled amount of calcium pantothenate ( $C_{18}H_{32}CaN_2O_{10}$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*  
 $r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Calcium Pantothenate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of calcium pantothenate in the *Sample solution* (mg/mL)▲<sup>USP36</sup>

**Acceptance criteria:** 95.0%–115.0%

### OTHER COMPONENTS

#### • CONTENT OF CALCIUM

**Sample:** A portion of the powder from NLT 20 finely powdered Tablets, equivalent to 500 mg of calcium pantothenate

**Blank:** Proceed as directed in the *Analysis*, without the *Sample*.

#### Titrimetric system

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Indicator:** Hydroxy naphthol blue, 300 mg

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* to a suitable crucible. Ignite, gently at first, until free from carbon. Cool the crucible. Add 10 mL of water, and dissolve the residue by adding sufficient 3 N hydrochloric acid, dropwise, to completely dissolve. Transfer the solution to a suitable container, and dilute with water to 150 mL. Add 15 mL of 1 N sodium hydroxide, then add the *Indicator*. Titrate with *Titrant* to a distinct blue endpoint. Perform a blank determination.

Calculate the percentage of calcium in the content of calcium pantothenate, as determined by the *Assay*, in the portion of Tablets taken:

$$\text{Result} = \{[(V_S - V_B) \times M \times F]/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$M$  = actual molarity of the *Titrant* (mM/mL)

$F$  = equivalency factor, 40.08 mg/mM

$W$  = weight of calcium pantothenate in the *Sample* taken, as determined by the *Assay* (mg)

**Acceptance criteria:** 7.9%–9.7% of the weight of calcium pantothenate ( $C_{18}H_{32}CaN_2O_{10}$ ) in the Tablets, as determined by the *Assay*

### PERFORMANCE TESTS

#### • DISSOLUTION, Procedure for a Pooled Sample <711>

**Medium:** Water; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Mobile phase:** Phosphoric acid and water (1:1000)

**Standard solution:** A known concentration of USP Calcium Pantothenate RS in *Medium*

**Sample solution:** A filtered portion of the solution under test, suitably diluted with *Medium* if necessary, having a concentration of  $C_{18}H_{32}CaN_2O_{10}$  similar to that of the *Standard solution*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 3.9-mm × 15-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 10 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 3.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of calcium pantothenate ( $C_{18}H_{32}CaN_2O_{10}$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times [C_S \times D \times (V/L)] \times 100$$

- $r_U$  = peak area of calcium pantothenate from the *Sample solution*  
 $r_S$  = peak area of calcium pantothenate from the *Standard solution*  
 $C_S$  = concentration of the *Standard solution* (mg/mL)  
 $D$  = dilution factor for the *Sample solution*  
 $V$  = volume of *Medium*, 900 mL  
 $L$  = label claim (mg/Tablet)  
**Tolerances:** NLT 75% ( $Q$ ) of the labeled amount of calcium pantothenate ( $C_{18}H_{32}CaN_2O_{10}$ ) is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label the Tablets to indicate the content of dextrorotatory calcium pantothenate.

**Change to read:**

- **USP REFERENCE STANDARDS** (11)  
 USP Calcium Pantothenate RS  
 ▲USP Racemic Panthenol RS▲<sup>USP36</sup>

**Racemic Calcium Pantothenate**

$C_{18}H_{32}CaN_2O_{10}$  476.53  
 $\beta$ -Alanine, *N*-(2,4-dihydroxy-3,3-dimethyl-1-oxobutyl)-, calcium salt (2:1), ( $\pm$ );  
 Calcium DL-pantothenate (1:2) [6381-63-1].

**DEFINITION**

Racemic Calcium Pantothenate is a mixture of the calcium salts of the dextrorotatory and levorotatory isomers of pantothenic acid. It contains NLT 5.7% and NMT 6.0% of nitrogen (N), and NLT 8.2% and NMT 8.6% of calcium (Ca), both calculated on the dried basis.

[NOTE—The physiological activity of Racemic Calcium Pantothenate is approximately one-half that of Calcium Pantothenate.]

$CaHPO_4 \cdot 2H_2O$  172.09  
 Phosphoric acid, calcium salt (1:1);  
 Calcium phosphate, dihydrate (1:1) [7789-77-7].

**DEFINITION**

Dibasic Calcium Phosphate Dihydrate contains two molecules of water of hydration. It contains NLT 98.0% and NMT 105.0% of dibasic calcium phosphate dihydrate ( $CaHPO_4 \cdot 2H_2O$ ).

**IDENTIFICATION**

- **A.**  
 Sample: 0.1 g of Dibasic Calcium Phosphate Dihydrate

**Analysis:** Dissolve the *Sample* by warming in 10 mL of 2 N hydrochloric acid. Add 2.5 mL of ammonia TS dropwise, with shaking, and then add 5 mL of ammonium oxalate TS.

**Acceptance criteria:** A white precipitate is formed.

• **B.**

**Sample:** 0.1 g of Dibasic Calcium Phosphate Dihydrate

**Analysis:** Dissolve the *Sample* in 5 mL of diluted nitric acid. Warm the solution to 70°, and add 2 mL of 10% ammonium molybdate solution (freshly prepared).

**Acceptance criteria:** A yellow precipitate of ammonium phosphomolybdate is formed.

## ASSAY

### • PROCEDURE

**Buffer:** Dissolve 53.5 g of ammonium chloride with sufficient water in a 1000-mL volumetric flask. Add 570 mL of ammonia water, stronger, and dilute with water to volume. The pH of this solution is 10.7.

**Sample solution:** Transfer 400 mg of Dibasic Calcium Phosphate Dihydrate to a 200-mL volumetric flask. Dissolve in 12 mL of diluted hydrochloric acid with the aid of gentle heat, if necessary, and dilute with water to volume.

**Blank:** 20 mL of water containing 1.2 mL of diluted hydrochloric acid

#### Titrimetric system

(See *Titrimetry* (541).)

**Mode:** Residual titration

**Titrant:** 0.02 M edetate disodium VS

**Back-titrant:** 0.02 M zinc sulfate VS

**Endpoint detection:** Visual

**Analysis:** To 20.0 mL of the *Sample solution* add 25.0 mL of *Titrant*, 50 mL of water, and 5 mL of *Buffer*. Add 25 mg of eriochrome black T–sodium chloride indicator. Titrate the excess *Titrant* with the *Back-titrant*. Perform a *Blank* determination in the same manner.

Calculate the percentage of dibasic calcium phosphate dihydrate ( $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$ ) in the sample taken:

$$\text{Result} = \{[(V_B - V_S) \times M \times F] / W\} \times 100$$

$V_B$  = Back-titrant volume consumed by the *Blank* (mL)

$V_S$  = Back-titrant volume consumed by the *Sample* (mL)

$M$  = actual molarity of the *Back-titrant* (mM/mL)

$F$  = equivalency factor, 172.1 mg/mM

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 98.0%–105.0%

## IMPURITIES

### • CARBONATE

**Sample:** 1.0 g of Dibasic Calcium Phosphate Dihydrate

**Analysis:** Mix the *Sample* with 5 mL of carbon dioxide-free water, and immediately add 2 mL of hydrochloric acid.

**Acceptance criteria:** No effervescence occurs.

### • CHLORIDE AND SULFATE, Chloride (221)

**Standard:** 0.70 mL of 0.010 N hydrochloric acid

**Sample:** 0.2 g of Dibasic Calcium Phosphate Dihydrate

**Analysis:** To the *Sample* add 20 mL of water and 13 mL of diluted nitric acid, and warm gently, if necessary, to completely dissolve. Dilute with water to 100 mL, and filter if necessary. To 50 mL of the filtrate add 1 mL of silver nitrate TS.

**Acceptance criteria:** The turbidity of the *Sample* does not exceed that of the *Standard* (NMT 0.25%).

### • CHLORIDE AND SULFATE, Sulfate (221)

**Standard:** 1.0 mL of 0.010 N sulfuric acid

**Sample:** 0.5 g of Dibasic Calcium Phosphate Dihydrate

**Analysis:** To the *Sample* add 5 mL of water and 5 mL of diluted hydrochloric acid, and warm gently, if necessary, to completely dissolve. Dilute with water to

100 mL, and filter if necessary. To 20 mL of the filtrate add 1 mL of diluted hydrochloric acid, and dilute with water to 50 mL. Add 1 mL of barium chloride TS.

**Acceptance criteria:** The turbidity of the *Sample* does not exceed that of the *Standard* (NMT 0.5%).

### • ARSENIC, Method I (211)

**Test preparation:** 1.0 g in 25 mL of 3 N hydrochloric acid, diluted with water to 55 mL. Omit the addition of 20 mL of 7 N sulfuric acid specified in *Procedure*.

**Acceptance criteria:** NMT 3 µg/g

### • BARIUM

**Sample:** 0.5 g Dibasic Calcium Phosphate Dihydrate

**Analysis:** Heat the *Sample* to boiling with 10 mL of water, and add 1 mL of hydrochloric acid dropwise, stirring after each addition. Allow to cool, and filter, if necessary. To the filtrate add 2 mL of potassium sulfate TS.

**Acceptance criteria:** No turbidity is produced within 10 min.

### • HEAVY METALS, Method I (231)

**Test preparation:** Warm 1.3 g with 3 mL of 3 N hydrochloric acid to completely dissolve. Cool, dilute with water to 50 mL, and filter.

**Acceptance criteria:** NMT 30 ppm

### • LIMIT OF ACID-INSOLUBLE SUBSTANCES

**Sample solution:** Dissolve 5.0 g in a mixture of 40 mL of water and 10 mL of hydrochloric acid by boiling gently for 5 min.

**Analysis:** After cooling, collect the insoluble substance on ashless filter paper, and wash with water until the last washing does not give a reaction for chloride (no turbidity results from the addition of silver nitrate TS). Ignite to completely incinerate the residue and the ashless filter paper at  $600 \pm 50^\circ$ .

**Acceptance criteria:** The weight of the residue does not exceed 10 mg (NMT 0.2%).

### • LIMIT OF FLUORIDE

[NOTE—Prepare and store all solutions in plastic containers.]

**Buffer solution:** 294 mg/mL of sodium citrate dihydrate in water

**Standard stock solution:** 1.1052 mg/mL of USP Sodium Fluoride RS in water

**Standard solution:** Transfer 20.0 mL of *Standard stock solution* to a 100-mL volumetric flask containing 50.0 mL of *Buffer solution*, dilute with water to volume, and mix. Each mL of this solution contains 100 µg of fluoride ion.

**Sample solution:** Transfer 2.0 g of Dibasic Calcium Phosphate dihydrate to a beaker containing a plastic-coated stirring bar. Add 20 mL of water and 2.0 mL of hydrochloric acid, and stir until dissolved. Add 50.0 mL of *Buffer solution* and sufficient water to make 100 mL.

**Electrode system:** Use a fluoride-specific ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of  $\pm 0.2$  mV (see pH (791)).

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

**Standard response line:** Transfer 50.0 mL of *Buffer solution* and 2.0 mL of hydrochloric acid to a beaker, and add water to make 100 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, stir for 15 min, and read the potential in mV. Continue stirring, and at 5-min intervals add 100, 100, 300, and 500 µL of *Standard solution*, reading the potential 5 min after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1, 0.2, 0.5, and 1.0 µg/mL) versus potential in mV.

Rinse and dry the electrodes, insert them into the *Sample solution*, stir for 5 min, and read the potential in mV. From the measured potential and the *Standard response line* determine the concentration,  $C$  (in µg/mL), of fluoride ion in the *Sample solution*.

Calculate the content of fluoride (ppm) in the portion of Dibasic Calcium Phosphate Dihydrate taken:

$$\text{Result} = (V \times C)/W$$

- $V$  = Sample solution volume (mL)  
 $C$  = concentration of fluoride ion, determined from the *Standard response line*, in the *Sample solution* (µg/mL)  
 $W$  = weight of Dibasic Calcium Phosphate Dihydrate taken to prepare the *Sample solution* (g)

**Acceptance criteria:** NMT 50 ppm

### SPECIFIC TESTS

#### • LOSS ON IGNITION (733)

**Sample:** 1 g of Dibasic Calcium Phosphate Dihydrate

**Analysis:** Ignite the *Sample* at 800°–825° to constant weight.

**Acceptance criteria:** 24.5%–26.5%

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.
- **USP REFERENCE STANDARDS (11)**  
USP Sodium Fluoride RS

## Anhydrous Dibasic Calcium Phosphate

### Pharmacopeial Discussion Group Sign-Off Document

**Legend:** + will adopt and implement; - will not stipulate.

**Nonharmonized attributes:** *Packaging and storage, Heavy metals, Limit of fluoride, Iron*

**Specific local attributes:** Identification C (EP), Lead (USP), Description (JP)

CaHPO<sub>4</sub> 136.06  
 Phosphoric acid, calcium salt (1:1);  
 Calcium phosphate (1:1) [7757-93-9].

### DEFINITION

Anhydrous Dibasic Calcium Phosphate contains NLT 98.0% and NMT 103.0% of anhydrous dibasic calcium phosphate (CaHPO<sub>4</sub>).

### IDENTIFICATION

- **A.**  
**Sample:** 0.1 g of Anhydrous Dibasic Calcium Phosphate  
**Analysis:** Dissolve the *Sample* by warming in 10 mL of 2 N hydrochloric acid. Add 2.5 mL of ammonia TS dropwise, with shaking, and then add 5 mL of ammonium oxalate TS.  
**Acceptance criteria:** A white precipitate is formed.
- **B.**  
**Sample:** 0.1 g of Anhydrous Dibasic Calcium Phosphate  
**Analysis:** Dissolve the *Sample* in 5 mL of diluted nitric acid. Warm the solution to 70°, and add 2 mL of 10% ammonium molybdate solution (freshly prepared).

**Acceptance criteria:** A yellow precipitate of ammonium phosphomolybdate is formed.

### ASSAY

#### • PROCEDURE

**Buffer:** Dissolve 53.5 g of ammonium chloride with sufficient water in a 1000-mL volumetric flask. Add 570 mL of ammonia water, stronger, and dilute with water to volume. The pH of this solution is 10.7.

**Sample solution:** Transfer 400 mg of Anhydrous Dibasic Calcium Phosphate to a 200-mL volumetric flask. Dissolve in 12 mL of diluted hydrochloric acid with the aid of gentle heat, if necessary, and dilute with water to volume.

**Blank:** 20 mL of water containing 1.2 mL of diluted hydrochloric acid

#### Titrimetric system

(See *Titrimetry* (541).)

**Mode:** Residual titration

**Titrant:** 0.02 M edetate disodium VS

**Back-titrant:** 0.02 M zinc sulfate VS

**Endpoint detection:** Visual

**Analysis:** To 20.0 mL of the *Sample solution* add 25.0 mL of *Titrant*, 50 mL of water, and 5 mL of *Buffer*. Add 25 mg of eriochrome black T–sodium chloride indicator. Titrate the excess *Titrant* with the *Back-titrant*. Perform a *Blank* determination in the same manner.

Calculate the percentage of anhydrous dibasic calcium phosphate (CaHPO<sub>4</sub>) in the sample taken:

$$\text{Result} = \{[(V_B - V_S) \times M \times F]/W\} \times 100$$

$V_B$  = Back-titrant volume consumed by the *Blank* (mL)

$V_S$  = Back-titrant volume consumed by the *Sample* (mL)

$M$  = actual molarity of the *Back-titrant* (mM/mL)

$F$  = equivalency factor, 136.06 mg/mM

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 98.0%–103.0%

### IMPURITIES

#### • CARBONATE

**Sample:** 1.0 g of Anhydrous Dibasic Calcium Phosphate

**Analysis:** Mix the *Sample* with 5 mL of carbon dioxide-free water, and immediately add 2 mL of hydrochloric acid.

**Acceptance criteria:** No effervescence occurs.

#### • CHLORIDE AND SULFATE, Chloride (221)

**Standard:** 0.70 mL of 0.010 N hydrochloric acid

**Sample:** 0.2 g of Anhydrous Dibasic Calcium Phosphate

**Analysis:** To the *Sample* add 20 mL of water and 13 mL of diluted nitric acid, and warm gently, if necessary, to completely dissolve. Dilute with water to 100 mL, and filter if necessary. To 50 mL of the filtrate add 1 mL of silver nitrate TS.

**Acceptance criteria:** The turbidity of the *Sample* does not exceed that of the *Standard* (NMT 0.25%).

#### • CHLORIDE AND SULFATE, Sulfate (221)

**Standard:** 1.0 mL of 0.010 N sulfuric acid

**Sample:** 0.5 g of Anhydrous Dibasic Calcium Phosphate

**Analysis:** To the *Sample* add 5 mL of water and 5 mL of diluted hydrochloric acid, and warm gently, if necessary, to completely dissolve. Dilute with water to 100 mL, and filter if necessary. To 20 mL of the filtrate add 1 mL of diluted hydrochloric acid, and dilute with water to 50 mL. Add 1 mL of barium chloride TS.

**Acceptance criteria:** The turbidity of the *Sample* does not exceed that of the *Standard* (NMT 0.5%).

#### • ARSENIC, Method I (211)

**Test preparation:** 1.0 g in 25 mL of 3 N hydrochloric acid, diluted with water to 55 mL. Omit the addition of 20 mL of 7 N sulfuric acid specified in *Procedure*.

**Acceptance criteria:** NMT 3 µg/g

• **BARIUM**

**Sample:** 0.5 g Anhydrous Dibasic Calcium Phosphate

**Analysis:** Heat the *Sample* to boiling with 10 mL of water, and add 1 mL of hydrochloric acid dropwise, stirring after each addition. Allow to cool, and filter if necessary. To the filtrate add 2 mL of potassium sulfate TS. **Acceptance criteria:** No turbidity is produced within 10 min.

• **HEAVY METALS, Method I (231)**

**Test preparation:** Warm 1.3 g with 3 mL of 3 N hydrochloric acid to completely dissolve. Cool, dilute with water to 50 mL, and filter.

**Acceptance criteria:** NMT 30 ppm

• **LIMIT OF ACID-INSOLUBLE SUBSTANCES**

**Sample solution:** Dissolve 5.0 g in a mixture of 40 mL of water and 10 mL of hydrochloric acid by boiling gently for 5 min.

**Analysis:** After cooling, collect the insoluble substance on ashless filter paper, and wash with water until the last washing does not give a reaction for chloride (no turbidity results from the addition of silver nitrate TS). Ignite to completely incinerate the residue and the ashless filter paper at  $600 \pm 50^\circ$ .

**Acceptance criteria:** The weight of the residue does not exceed 10 mg (NMT 0.2%).

• **LIMIT OF FLUORIDE**

[NOTE—Prepare and store all solutions in plastic containers.]

**Buffer solution:** 294 mg/mL of sodium citrate dihydrate in water

**Standard stock solution:** 1.1052 mg/mL of USP Sodium Fluoride RS in water

**Standard solution:** Transfer 20.0 mL of *Standard stock solution* to a 100-mL volumetric flask containing 50.0 mL of *Buffer solution*, dilute with water to volume, and mix. Each mL of this solution contains 100 µg of fluoride ion.

**Sample solution:** Transfer 2.0 g of Anhydrous Dibasic Calcium Phosphate to a beaker containing a plastic-coated stirring bar. Add 20 mL of water and 2.0 mL of hydrochloric acid, and stir until dissolved. Add 50.0 mL of *Buffer solution* and sufficient water to make 100 mL.

**Electrode system:** Use a fluoride-specific ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of  $\pm 0.2$  mV (see pH (791)).

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Standard response line:** Transfer 50.0 mL of *Buffer solution* and 2.0 mL of hydrochloric acid to a beaker, and add water to make 100 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, stir for 15 min, and read the potential in mV. Continue stirring, and at 5-min intervals add 100, 100, 300, and 500 µL of *Standard solution*, reading the potential 5 min after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1, 0.2, 0.5, and 1.0 µg/mL) versus potential in mV.

Rinse and dry the electrodes, insert them into the *Sample solution*, stir for 5 min, and read the potential in mV. From the measured potential and the *Standard response line* determine the concentration, *C* (in µg/mL), of fluoride ion in the *Sample solution*.

Calculate the content of fluoride (ppm) in the portion of Anhydrous Dibasic Calcium Phosphate taken:

$$\text{Result} = (V \times C)/W$$

*V* = *Sample solution* volume (mL)

*C* = concentration of fluoride ion, determined from the *Standard response line*, in the *Sample solution* (µg/mL)

*W* = weight of Anhydrous Dibasic Calcium Phosphate taken to prepare the *Sample solution* (g)

**Acceptance criteria:** NMT 50 ppm

**SPECIFIC TESTS**

• **LOSS ON IGNITION (733)**

**Sample:** 1 g of Anhydrous Dibasic Calcium Phosphate

**Analysis:** Ignite the *Sample* at  $800^\circ$ – $825^\circ$  to constant weight.

**Acceptance criteria:** 6.6%–8.5%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.

• **USP REFERENCE STANDARDS (11)**

USP Sodium Fluoride RS

## Dibasic Calcium Phosphate Tablets

**DEFINITION**

Dibasic Calcium Phosphate Tablets contain NLT 92.5% and NMT 107.5% of the labeled amount of dibasic calcium phosphate dihydrate ( $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$ ).

[NOTE—An equivalent amount of Dibasic Calcium Phosphate with less water of hydration may be used in place of  $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$  in preparing Dibasic Calcium Phosphate Tablets.]

**IDENTIFICATION**

• **A. IDENTIFICATION TESTS—GENERAL, Calcium (191)**

**Sample solution:** A filtered portion of the *Sample solution* from the *Assay*

**Acceptance criteria:** Meets the requirements

• **B. IDENTIFICATION TESTS—GENERAL, Phosphate (191)**

**Sample solution:** A filtered portion of the *Sample solution* from the *Assay*, neutralized with ammonium hydroxide

**Acceptance criteria:** Meets the requirements

**ASSAY**

• **PROCEDURE**

**Sample solution:** Transfer a portion of powder, equivalent to 1 g of dibasic calcium phosphate dihydrate, from NLT 20 powdered Tablets, to a 100-mL volumetric flask containing 15 mL of hydrochloric acid and 10 mL of water. Heat on a steam bath, with occasional mixing, to dissolve the dibasic calcium phosphate, but not longer than 30 min. Cool, add water to volume, and mix. If the solution is not clear, filter, discarding the first 10 mL of the filtrate.

**Blank:** Water

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.05 M edetate disodium VS

**Indicator:** Hydroxy naphthol blue

**Endpoint detection:** Visual

**Analysis:** Transfer 25.0 mL of the *Sample solution* to a 250-mL beaker equipped with a magnetic stirrer. With constant stirring, add, in the order named, 0.5 mL of triethanolamine, 300 mg of *Indicator*, and from a 50-mL buret, about 23 mL of *Titrant*. Add sodium hydroxide solution (45 in 100) until the initial red color changes to clear blue. Continue to add it dropwise until the color changes to violet, and add an additional 0.5 mL. The pH is 12.3–12.5. Continue the titration dropwise with the *Titrant* to the appearance of a clear blue endpoint that persists for NLT 60 s. Perform a blank determination.

Calculate the percentage of the labeled amount of dibasic calcium phosphate dihydrate ( $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$ ) in the portion of Tablets taken:

$$\text{Result} = \{[(V_s - V_b) \times N \times F]/W\} \times 100$$

- $V_s$  = Titrant volume consumed by the *Sample solution* (mL)  
 $V_b$  = Titrant volume consumed by the *Blank* (mL)  
 $M$  = actual molarity of the *Titrant* (mM/mL)  
 $F$  = equivalency factor, 172.08 mg/mM  
 $W$  = nominal weight of dibasic calcium phosphate dihydrate in the *Sample solution* taken for Analysis (mg)

Acceptance criteria: 92.5%–107.5%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 45 min

**Standard solution:** Solution having a known concentration of calcium in *Medium*

**Sample solution:** Filtered portion of the solution under test, suitably diluted with *Medium* if necessary

### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Atomic absorption spectrophotometry

**Analytical wavelength:** 422.7 nm

**Lamp:** Calcium hollow-cathode

**Flame:** Air-acetylene

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the concentration of calcium (Ca) in the *Sample solution* in comparison with a *Standard solution*.

Calculate the percentage of the labeled amount of dibasic calcium phosphate dihydrate ( $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$ ) dissolved:

$$\text{Result} = (A_u/A_s) \times (C_s \times D \times V/L) \times (M_r/A_r) \times 100$$

- $A_u$  = absorbance of the *Sample solution*  
 $A_s$  = absorbance of the *Standard solution*  
 $C_s$  = concentration of calcium in the *Standard solution* (mg/mL)  
 $D$  = dilution factor for the *Sample solution*  
 $V$  = volume of *Medium*, 900 mL  
 $L$  = label claim (mg/Tablet)  
 $M_r$  = molecular weight of dibasic calcium phosphate, 172.08  
 $A_r$  = atomic weight of calcium, 40.08

**Tolerances:** NLT 75% (Q) of the labeled amount of dibasic calcium phosphate dihydrate ( $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** The quantity of dibasic calcium phosphate stated in the labeling is in terms of dibasic calcium phosphate dihydrate ( $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$ ).

## Calcium Polycarbophil

Calcium polycarbophil [9003-97-8].

» Calcium Polycarbophil is the calcium salt of polyacrylic acid cross-linked with divinyl glycol.

**Packaging and storage**—Preserve in tight containers.

**Identification**—When tested as directed in the test for *Absorbing power*, it absorbs about 35 times its original weight.

**Loss on drying** <731>—Dry it in vacuum at 130° for 4 hours: it loses not more than 10.0% of its weight.

**Absorbing power**—Transfer about 250 mg, accurately weighed, to a tared 50-mL centrifuge tube fitted with a tight closure. Add 35 mL of 0.1 N hydrochloric acid to the tube, seal the tube, and shake by mechanical means for 30 minutes. Centrifuge at 2000 rpm for 20 minutes, and decant and discard the supernatant. [NOTE—Exercise care to avoid any loss of particles.] Add 35 mL of 0.1 N hydrochloric acid, and shake for 30 minutes. Centrifuge, decanting and discarding the supernatant. Repeat the foregoing steps, using water instead of acid. Add 35 mL of a sodium bicarbonate solution (15 in 1000), and shake, venting as necessary to release any carbon dioxide liberated. Shake for 1 hour, centrifuge, and decant the supernatant. Add 35 mL of sodium bicarbonate solution (15 in 1000), and shake for 1 hour. Allow the tube and contents to stand overnight or until the contents have settled, and centrifuge. Withdraw the supernatant, and weigh the tube and contents. Calculate the weight of sodium bicarbonate solution absorbed: not less than 35.0 g of the sodium bicarbonate solution is absorbed by 1.0 g of Calcium Polycarbophil, calculated on the dried basis.

**Content of calcium**—Transfer about 2 g of Calcium Polycarbophil, accurately weighed, to a tared crucible. Cover, leaving the lid slightly ajar, and place in a muffle furnace. Heat to 600° over 2 hours, increase the temperature to 1000° over 1 hour, and maintain at 1000° for 1 hour. Allow to cool slowly. Dissolve the residue in dilute hydrochloric acid (1 in 5), quantitatively transfer with the aid of dilute hydrochloric acid (1 in 5) to a 100-mL volumetric flask, and dilute with dilute hydrochloric acid (1 in 5) to volume. Pipet 15 mL of this solution into a 250-mL beaker, and add, while stirring with a magnetic stirrer, 100 mL of water, 20.0 mL of 0.05 M edetate disodium VS, and 300 mg of hydroxy naphthol blue. Adjust with 1 N sodium hydroxide solution to a pH of 9.0 to 9.5. Adjust with about 10 mL of 2 N sodium hydroxide to a pH of 12.4. Titrate with 0.05 M edetate disodium VS to a persistent blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 2.004 mg of calcium (Ca). The content of Ca found is not less than 18.0% and not more than 22.0%, calculated on the dried basis.

## Calcium Saccharate

$\text{C}_6\text{H}_8\text{CaO}_8 \cdot 4\text{H}_2\text{O}$

320.26

D-Glucaric acid, calcium salt (1:1) tetrahydrate;

Calcium D-glucarate (1:1), tetrahydrate [5793-89-5].

## DEFINITION

Calcium Saccharate is the calcium salt of D-saccharic acid. It contains NLT 98.5% and NMT 102.0% of  $\text{C}_6\text{H}_8\text{CaO}_8 \cdot 4\text{H}_2\text{O}$ .

## IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Calcium** <191>

**Sample:** 0.2 g

**Analysis:** Dissolve the *Sample* in 10 mL of water by the addition of 2 mL of hydrochloric acid.

Acceptance criteria: Meets the requirements

- **B. INFRARED ABSORPTION** (197M): Meets the requirements

## ASSAY

### PROCEDURE

Sample: 600 mg

Blank: 150.0 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.05 M edetate disodium VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 150 mL of water with the aid of a sufficient volume of hydrochloric acid.

While stirring, preferably with a magnetic stirrer, add 30 mL of *Titrant* from a 50-mL buret. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue. Continue the titration to a blue endpoint. Perform a *Blank* determination and make any necessary corrections.

Calculate the percentage of calcium saccharate ( $\text{C}_6\text{H}_8\text{CaO}_8 \cdot 4\text{H}_2\text{O}$ ) in the portion of Calcium Saccharate taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 320.2 mg/mEq

$W$  = *Sample* weight (mg)

Acceptance criteria: 98.5%–102.0%

## IMPURITIES

- **CHLORIDE AND SULFATE, Chloride** (221)

Standard: 0.50 mL of 0.020 N hydrochloric acid

Sample: 0.50 g dissolved in 10 mL of water by the addition of 2 mL of nitric acid

Acceptance criteria: NMT 0.07%

- **CHLORIDE AND SULFATE, Sulfate** (221)

Standard: 0.6 mL of 0.020 N sulfuric acid

Sample: 0.50 g dissolved in 10 mL of water by the addition of 2 mL of hydrochloric acid

Acceptance criteria: NMT 0.12%

- **HEAVY METALS, Method II** (231): NMT 20 ppm

- **SUCROSE AND REDUCING SUGARS**

Sample: 0.5 g

Analysis: Dissolve the *Sample* in 10 mL of water with the addition of 2 mL of hydrochloric acid, and boil the solution for about 2 min. Cool, add 15 mL of sodium carbonate TS, allow to stand for 5 min, and filter. Add 5 mL of the clear filtrate to about 2 mL of alkaline cupric tartrate TS, and boil for 1 min.

Acceptance criteria: No red precipitate is formed immediately.

## SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation** (781S)

Sample solution: 60 mg/mL in 4.8 N hydrochloric acid that has been allowed to stand for 1 h

Acceptance criteria: +18.5° to +22.5°

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
USP Calcium Saccharate RS

## Calcium Undecylenate

$\text{C}_{22}\text{H}_{38}\text{O}_4\text{Ca}$  406.61

10-Undecenoic acid, calcium (2+) salt.

Calcium 10-undecenoate.

» Calcium Undecylenate contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_{22}\text{H}_{38}\text{O}_4\text{Ca}$  (calcium undecylenate), calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

### Identification—

**A:** A filtered solution (1 in 20) in 3 N hydrochloric acid responds to the tests for *Calcium* (191).

**B:** Transfer 40 mL of water and 10 g of calcium undecylenate to a 250-mL separator. Cautiously and slowly add 10 mL of hydrochloric acid, while swirling. Insert the stopper, and shake. [NOTE—The separator will become quite warm, and pressure must be carefully and frequently relieved through the stopcock. If a curdy, white material remains after 5 minutes of shaking, add additional hydrochloric acid, 1 mL at a time, and shake until a clear oily phase is formed.] Allow the phases to separate, drain, and discard the bottom aqueous layer. Drain and discard the middle oily layer, if present. Filter the top layer of undecylenic acid through a pledget of cotton into a 10-mL graduated cylinder, noting the volume obtained. Transfer the filtrate to a 250-mL flask, and add an equal volume of aniline. Reflux for 1 hour, swirling the flask occasionally. Allow to cool, and pour 60 mL of alcohol through the condenser into the flask. Remove the flask from the condenser, add 1 g of charcoal, and stir. Filter the slurry into a 250-mL beaker. Add water dropwise until a few crystals form or the solution becomes slightly cloudy. [NOTE—If too much water is added, an oil will form. Add alcohol dropwise until the oil dissolves.] Allow the mixture to stand or refrigerate until crystals are formed. Collect the crystals on a filter paper inserted in a 45-mm porous glass filter funnel. Wash the crystals with 75 mL of 25% alcohol: the crystals have a clean, white, glossy appearance. If not, recrystallize by dissolving the crystals in about 50 mL of alcohol. Add about 1 g of charcoal, stir, filter into a 150-mL beaker, and continue as directed above, beginning with "Add water dropwise." Dry the crystals in vacuum at 50° for 2 hours: the crystals so obtained melt between 66° and 67.5°, the procedure for *Class Ia* being used (see *Melting Range or Temperature* (741)). [NOTE—If the melting point is low, additional drying or recrystallization may be necessary.]

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses between 2.0% and 5.7% of its weight.

**Particle size** (786)—Test in accordance with this procedure, except to use not more than 25 g, and except that a single No. 100 sieve is used and is to be shaken for not less than 30 minutes or until sifting is practically complete: not less than 99.0% of it passes through a No. 100 sieve.

**Limit of free undecylenic acid**—Transfer 10 g of Calcium Undecylenate, accurately weighed, to a 400-mL beaker, add 250 mL of solvent hexane, and mix for 2 hours using a magnetic stirrer. Filter into a 500-mL flask, evaporate with the aid of a current of air to about 20 mL, and add 100 mL of neutralized alcohol. Add 3 drops of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sodium hydroxide is equivalent to 18.43 mg of  $\text{C}_{11}\text{H}_{20}\text{O}_2$ : not more than 0.1% is found.

**Assay**—Boil 40.0 mL of 0.1 N hydrochloric acid VS with about 600 mg of Calcium Undecylenate, accurately weighed, for 10 minutes, or until the undecylenic acid layer is clear, adding water, as necessary, to maintain the original volume. Transfer the mixture, with the aid of water, to a 500-mL separator. Dilute with water to about 75 mL, and extract with two 100-mL portions of solvent hexane. Wash the combined extracts with water until the last washing is neutral to litmus, add the washings to the original water layer. Cool, add 3 drops of methyl orange TS, and titrate the excess hydrochloric acid with 0.1 N sodium hydroxide VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.1 N sodium hydroxide is equivalent to 20.33 mg of  $C_{22}H_{38}O_4Ca$ .

## Camphor

$C_{10}H_{16}O$  152.23  
Bicyclo[2.2.1]heptane-2-one, 1,7,7-trimethyl-;  
Camphor;  
2-Bornanone [76-22-2].

### DEFINITION

Camphor is a ketone of *Cinnamomum camphora* (L.) Nees et Ebermaier (Fam. Lauraceae) (natural Camphor), or is produced synthetically (synthetic Camphor).

### IMPURITIES

#### • LIMIT OF NONVOLATILE RESIDUE

**Sample:** 2.0 g of Camphor

**Analysis:** Heat the *Sample* in a tared dish on a steam bath until sublimation is complete. Dry the residue at 120° for 3 h, cool, and weigh.

**Acceptance criteria:** 0.05%; the weight of the residue does not exceed 1.0 mg.

#### • HALOGENS

**Sample:** Mix 100 mg of finely divided Camphor with 200 mg of sodium peroxide in a clean, dry, hard glass test tube about 25 mm in internal diameter and 20 cm in length. Suspend the tube at an angle of about 45°, using a clamp placed at the upper end. Gently heat the tube, starting near the upper end, but not heating the clamp. Gradually bring the heat toward the lower part of the tube until incineration is complete.

**Analysis:** Dissolve the residue in 25 mL of warm water, acidify with nitric acid, and filter the solution into a comparison tube. Wash the test tube and the filter with two 10-mL portions of hot water, adding the washings to the filtered solution. To the filtrate add 0.50 mL of 0.10 N silver nitrate, dilute with water to 50 mL, and mix.

**Acceptance criteria:** 0.035%; the turbidity does not exceed that produced in a blank test with the same quantities of the same reagents and 0.050 mL of 0.020 N hydrochloric acid.

### SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE** (741): 174°–179°

• **OPTICAL ROTATION, Specific Rotation** (781S)

**Sample solution:** 100 mg/mL in alcohol  
Synthetic Camphor is optically inactive.

**Acceptance criteria:** +41° to +43° for natural Camphor

• **APPEARANCE OF SOLUTION:** A 100-mg/mL solution in solvent hexane is clear.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and avoid exposure to excessive heat.
- **LABELING:** Label it to indicate whether it is of natural sources or is prepared synthetically.

## Camphor Spirit

» Camphor Spirit is an alcohol solution containing, in each 100 mL, not less than 9.0 g and not more than 11.0 g of camphor ( $C_{10}H_{16}O$ ).

Camphor .....	100 g
Alcohol, a sufficient quantity,	
to make .....	1000 mL

Dissolve the camphor in about 800 mL of the alcohol, and add alcohol to make 1000 mL. Filter, if necessary.

**Packaging and storage**—Preserve in tight containers.

**Alcohol content, Method II** (611): between 80.0% and 87.0% of  $C_2H_5OH$ , the dilution to approximately 2% alcohol being made with methanol instead of with water.

**Assay**—Transfer 2.0 mL of Camphor Spirit to a suitable pressure bottle containing 50 mL of freshly prepared dinitrophenylhydrazine TS. Close the pressure bottle, immerse it in a water bath, and maintain at about 75° for 16 hours. Cool to room temperature, and transfer the contents to a beaker with the aid of 100 mL of 3 N sulfuric acid. Allow to stand at room temperature for not less than 12 hours, transfer the precipitate to a tared filter crucible, and wash with 100 mL of 3 N sulfuric acid followed by 75 mL of cold water in divided portions. Continue the suction until the excess water is removed, dry the crucible and precipitate at 80° for 2 hours, cool, and weigh. The weight of the precipitate so obtained, multiplied by 0.4581, represents the weight of  $C_{10}H_{16}O$  in the specimen taken.

## Candesartan Cilexetil

$C_{33}H_{34}N_6O_6$

1*H*-Benzimidazole-7-carboxylic acid, 2-ethoxy-1-[[2'-(1*H*-tetrazol-5-yl)[1,1'-biphenyl]-4-yl]methyl]-, 1-[[[(cyclohexyloxy)carbonyl]oxy]ethyl ester, (±);

(±)-1-Hydroxyethyl 2-ethoxy-1-[*p*-(*o*-1*H*-tetrazol-5-ylphenyl)benzyl]-7-benzimidazolecarboxylate, cyclohexyl carbonate (ester). 610.66  
[145040-37-5].

### DEFINITION

Candesartan Cilexetil contains NLT 98.7% and NMT 101.0% of  $C_{33}H_{34}N_6O_6$ , calculated on anhydrous basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K): If the spectra obtained show differences, proceed with the samples prepared as follows. Separately dissolve a quantity of USP Candesartan Cilexetil RS and Candesartan Cilexetil in alcohol. [NOTE—Heating the solution may be necessary for complete dissolution.] Cool the solution in an ice bath, filter the crystals, and dry at 105°.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the procedure for *Organic Impurities*.

**ASSAY**• **PROCEDURE**

**Sample solution:** 8.33 mg/mL of Candesartan Cilexetil in glacial acetic acid

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Potentiometric

**Titrant:** 0.1 N perchloric acid

**Analysis:** Titrate with 8 mL of 0.1 N perchloric acid VS using a blank determination under the same conditions. Each mL of the *Titrant* is equivalent to 61.07 mg of C<sub>33</sub>H<sub>34</sub>N<sub>6</sub>O<sub>6</sub>.

**Acceptance criteria:** 98.7%–101.0% on the anhydrous basis

**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.1%, determined from a 1-g sample

**Organic Impurities**• **PROCEDURE**

**Diluent:** Acetonitrile and water (3:2)

**Solution A:** Acetonitrile, glacial acetic acid, and water (57:1:43)

**Solution B:** Acetonitrile, glacial acetic acid, and water (90:1:10)

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
30	0	100

[NOTE—Equilibration for about 10 min may be necessary between injections.]

**System suitability solution:** 0.04 mg/mL of USP Candesartan Cilexetil RS and 0.125 mg/mL of acenaphthene in *Diluent*

**Standard solution:** 4 µg/mL of USP Candesartan Cilexetil RS in *Diluent*

**Sample solution:** 0.4 mg/mL of Candesartan Cilexetil in *Diluent*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 15-cm; 4-µm packing L1

**Flow rate:** 0.8 mL/min

**Injection size:** 10 µL

**System suitability**

[NOTE—The *Mobile phase* used for testing system suitability is 100% *Solution A* in an isocratic mode.]

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 5.0 between candesartan cilexetil and acenaphthene

**Tailing factor:** NMT 1.5 for candesartan cilexetil

**Relative standard deviation:** NMT 3.0% for the candesartan cilexetil peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Candesartan Cilexetil taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of candesartan cilexetil from the *Standard solution*

$C_S$  = concentration of USP Candesartan Cilexetil RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Candesartan Cilexetil in the *Sample solution* (mg/mL)

**Acceptance criteria**

**Individual impurities:** See *Table 1*.

**Total impurities:** NMT 0.6%. [NOTE— Calculate the total impurities from the sum of all impurity peaks greater than or equal to 0.05%.]

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Ethyl candesartan <sup>a</sup>	0.4	0.2
Desethyl candesartan cilexetil <sup>b</sup>	0.5	0.3
Candesartan cilexetil	1.0	—
N <sup>2</sup> -Ethyl candesartan cilexetil <sup>c</sup>	2.0	0.2
Any other unknown impurity	—	0.10

<sup>a</sup> Ethyl 1-[[2'-(1*H*-tetrazol-5-yl)biphenyl-4-yl]methyl]-2-ethoxybenzimidazole-7-carboxylate.

<sup>b</sup> ±1-(Cyclohexyloxycarbonyloxy)ethyl 1-[[2'-(1*H*-tetrazol-5-yl)biphenyl-4-yl]methyl]-2-oxobenzimidazole-7-carboxylate.

<sup>c</sup> ±1-(Cyclohexyloxycarbonyloxy)ethyl 2-ethoxy-1-[[2'-(*N*-ethyl-tetrazol-5-yl)biphenyl-4-yl]methyl]benzimidazole-7-carboxylate.

**SPECIFIC TESTS**

- **WATER DETERMINATION, Method 1** (921): NMT 0.3%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS** (11)

USP Candesartan Cilexetil RS

1*H*-Benzimidazole-7-carboxylic acid, 2-ethoxy-1-[[2'-(1*H*-tetrazol-5-yl)[1,1'-biphenyl]-4-yl]methyl]-, 1-[[cyclohexyloxy]carbonyloxy]ethyl ester, (±); (±)-1-Hydroxyethyl 2-ethoxy-1-[*p*-(*o*-1*H*-tetrazol-5-ylphenyl)benzyl]-7-benzimidazolecarboxylate, cyclohexyl carbonate (ester).  
610.66

**Capecitabine**

C<sub>15</sub>H<sub>22</sub>FN<sub>3</sub>O<sub>6</sub>

359.35

Carbamic acid, [1-(5-deoxy-β-D-ribofuranosyl)-5-fluoro-1,2-dihydro-2-oxo-4-pyrimidinyl]-, pentyl ester;  
Pentyl 1-(5-deoxy-β-D-ribofuranosyl)-5-fluoro-1,2-dihydro-2-oxo-4-pyrimidinecarbamate [154361-50-9].

**DEFINITION**

Capecitabine contains NLT 98.0% and NMT 102.0% of  $C_{15}H_{22}FN_3O_6$ , calculated on the anhydrous and solvent-free basis.

**IDENTIFICATION**• **A. INFRARED ABSORPTION** (197K)

**Sample:** 2 mg of sample in 300 mg of potassium bromide

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Diluent:** Methanol, acetonitrile, and water (7:1:12)

**Solution A:** 0.1% mixture of glacial acetic acid in water

**Solution B:** Methanol, acetonitrile, and *Solution A* (7:1:12)

**Solution C:** Methanol, acetonitrile, and *Solution A* (16:1:3)

**Mobile phase:** See the gradient table below.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{15}H_{22}FN_3O_6$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Capecitabine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of capecitabine in the *Sample solution* (mg/mL)

## Capecitabine Tablets

**DEFINITION**

Capecitabine Tablets contain NLT 93.0% and NMT 105.0% of the labeled amount of capecitabine ( $C_{15}H_{22}FN_3O_6$ ).

**IDENTIFICATION**• **A. INFRARED ABSORPTION** (197K)

**Analytical wave number:** 1500–1760  $\text{cm}^{-1}$

**Sample:** Grind 1 Tablet to a fine powder with a mortar and pestle. Mix 1 mg of this sample with 300 mg of potassium bromide.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Diluent:** Methanol, acetonitrile, and water (7:1:12)

**Solution A:** 0.1% mixture of glacial acetic acid in water

**Solution B:** Methanol, acetonitrile, and *Solution A* (7:1:12)

**Solution C:** Methanol, acetonitrile, and *Solution A* (16:1:3)

**Mobile phase:** See the gradient table below.

Time (min)	Solution B (%)	Solution C (%)
0	100	0
5	100	0

Acceptance criteria: 93.0%–105.0%

## PERFORMANCE TESTS

### • DISSOLUTION (711)

Medium: Water; 900 mL, degassed

Apparatus 2: 50 rpm

Time: 30 min

#### Standard solutions

For Tablets labeled to contain 150 mg: 17 mg of USP Capecitabine RS in 100 mL of Medium

For Tablets labeled to contain 500 mg: 28 mg of USP Capecitabine RS in 50 mL of Medium

Sample solution: Pass a portion of the solution under test through a fiberglass filter of 0.45-μm pore size.

Analysis: Determine the amount of C<sub>15</sub>H<sub>22</sub>FN<sub>3</sub>O<sub>6</sub> dissolved by selecting a wavelength with appropriate sensitivity between 300 and 330 nm on portions of the Sample solution, suitably diluted with Medium, if necessary, in comparison with the appropriate Standard solution, using a 1-mm quartz cell. Calculate the percentage of C<sub>15</sub>H<sub>22</sub>FN<sub>3</sub>O<sub>6</sub> dissolved in each Tablet:

$$\text{Result} = (A_U/A_S) \times C_S \times (V/L) \times 100$$

A<sub>U</sub> = absorbance of the Sample solution

A<sub>S</sub> = absorbance of the Standard solution

C<sub>S</sub> = concentration of capecitabine in the Standard solution (mg/mL)

V = volume of medium, 900 mL

L = Tablet label claim (mg)

Tolerances: NLT 80% (Q) of the labeled amount of C<sub>15</sub>H<sub>22</sub>FN<sub>3</sub>O<sub>6</sub> is dissolved.

### • UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

## IMPURITIES

### Organic Impurities

#### • PROCEDURE

Diluent, Solution A, Solution B, Solution C, Mobile phase, System suitability solution, Standard solution, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

## Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

r<sub>U</sub> = peak response for each impurity from the Sample solution

r<sub>S</sub> = peak response for capecitabine from the Standard solution

C<sub>S</sub> = concentration of USP Capecitabine RS in the Standard solution (mg/mL)

C<sub>U</sub> = nominal concentration of capecitabine in the Sample solution (mg/mL)

F = relative response factor for each impurity, from Impurity Table 1

## Acceptance criteria

Individual impurities: See Impurity Table 1.

Total degradation products: NMT 2.0%

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.

### • USP REFERENCE STANDARDS (11)

The impurities marked with an "\*" are process impurities and are not included in the total degradation products.

## Capreomycin Sulfate

Capreomycin sulfate [1405-37-4].

$\text{C}_{25}\text{H}_{44}\text{N}_{14}\text{O}_8$  668.71

Capreomycin 1A (free base);

3,6-Diamino-*N*-[[(2*S*,5*S*,11*S*,15*S*,*Z*)-15-amino-2-(hydroxymethyl)-11-[(*R*)-iminohexahydropyrimidin-4-yl]-3,6,9,12,16-pentaoxo-8-(ureidomethylene)-1,4,7,10,13-pentaazacyclohexadecan-5-yl]methyl]hexanamide [37290-35-6].

$\text{C}_{25}\text{H}_{44}\text{N}_{14}\text{O}_7$  652.71

Capreomycin 1B (free base);

3,6-Diamino-*N*-[[(2*S*,5*S*,11*S*,15*S*,*Z*)-15-amino-11-[(*R*)-iminohexahydropyrimidin-4-yl]-2-methyl-3,6,9,12,16-pentaoxo-8-(ureidomethylene)-1,4,7,10,13-pentaazacyclohexadecan-5-yl]methyl]hexanamide [33490-33-4].

### DEFINITION

Capreomycin Sulfate is the disulfate salt of capreomycin, a polypeptide mixture produced by the growth of *Streptomyces capreolus*, suitable for parenteral use. It has a potency equivalent to NLT 700 µg/mg and NMT 1050 µg/mg of capreomycin.

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Sulfate** <191>
- **B.** The retention times of the major peaks of the *Sample solution* correspond to those of the *System suitability solution*, as obtained in the test for *Capreomycin 1 Content*.

### ASSAY

- **PROCEDURE:** Proceed as directed in *Antibiotics—Microbial Assays* <81>.
- Acceptance criteria: 700–1050 µg/mg

### IMPURITIES

#### Inorganic Impurities

- **RESIDUE ON IGNITION** <281>: NMT 3.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid
- **HEAVY METALS, Method II** <231>: NMT 30 ppm

### SPECIFIC TESTS

#### CAPREOMYCIN 1 CONTENT

**Solution A:** 0.4 mg/mL of ammonium bisulfate in water. Pass through a filter of 0.5-µm or less pore size.

**Mobile phase:** Methanol and *Solution A* (2:3)

**System suitability solution:** 0.25 mg/mL of USP Capreomycin Sulfate RS in water

**Sample solution:** 0.25 mg/mL of Capreomycin Sulfate in water

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 268 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L10

**Column temperature:** 30°

**Flow rate:** 1.5 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times of capreomycin 1A and capreomycin 1B are 0.85 and 1.0, respectively.]

### Suitability requirements

**Resolution:** NLT 1.5 between capreomycin 1A and capreomycin 1B

**Tailing factor:** NMT 3.5 for the major peaks (capreomycin 1A and capreomycin 1B)

### Analysis

[NOTE—The chromatographic run time is at least five times the retention time of the capreomycin 1A peak.]

**Sample:** *Sample solution*

Calculate the percentage of capreomycin 1 in the portion of Capreomycin Sulfate taken:

$$\text{Result} = [(r_{1A} + r_{1B})/r_T] \times 100$$

$r_{1A}$  = peak area response of capreomycin 1A

$r_{1B}$  = peak area response of capreomycin 1B

$r_T$  = total response for all peaks

**Acceptance criteria:** NLT 90.0%

#### • pH <791>: 4.5–7.5

**Sample solution:** 30 mg/mL

- **LOSS ON DRYING** <731>: Dry 100 mg in a vacuum at a pressure not exceeding 5 mm of mercury at 100° for 4 h; it loses NMT 10.0% of its weight.

- **BACTERIAL ENDOTOXINS TEST** <85>: Where it is intended for use in preparing injectable dosage forms: NMT 0.35 USP Endotoxin Unit/mg of capreomycin

- **OTHER REQUIREMENTS:** Where the label states that Capreomycin Sulfate is sterile, it meets the requirements under *Injections* <1>.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP REFERENCE STANDARDS** <11>
  - USP Capreomycin Sulfate RS
  - USP Endotoxin RS

## Capreomycin for Injection

### DEFINITION

Capreomycin for Injection contains an amount of Capreomycin Sulfate equivalent to NLT 90.0% and NMT 115.0% of the labeled amount of capreomycin.

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Sulfate** <191>
- **B.** The retention times of the major peaks of the *Sample solution* correspond to those of the *System suitability solution*, as obtained in the test for *Capreomycin 1 Content*.

### ASSAY

- **PROCEDURE:** Proceed as directed in *Antibiotics—Microbial Assays* <81>.

Acceptance criteria: 90.0%–115.0%

### IMPURITIES

#### Inorganic Impurities

- **RESIDUE ON IGNITION** <281>: NMT 3.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid
- **HEAVY METALS, Method II** <231>: NMT 30 ppm

### SPECIFIC TESTS

#### • CAPREOMYCIN 1 CONTENT

**Solution A:** 0.4 mg/mL of ammonium bisulfate in water. Pass through a filter of 0.5-µm or less pore size.

**Mobile phase:** Methanol and *Solution A* (2:3)

**System suitability solution:** 0.25 mg/mL of USP Capreomycin Sulfate RS in water

**Sample solution:** 0.25 mg/mL of Capreomycin for Injection in water

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 268 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L10

**Column temperature:** 30°

**Flow rate:** 1.5 mL/min

**Injection size:** 20 μL

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times of capreomycin 1A and capreomycin 1B are 0.85 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.5 between capreomycin 1A and capreomycin 1B

**Tailing factor:** NMT 3.5 for the major peaks (capreomycin 1A and capreomycin 1B)

**Analysis**

[NOTE—The chromatographic run time is at least five times the retention time of the capreomycin 1A peak.]

**Sample:** *Sample solution*

Calculate the percentage of capreomycin 1 in the portion of Capreomycin for Injection taken:

$$\text{Result} = (r_{1A} + r_{1B})/r_T \times 100$$

$r_{1A}$  = peak area response for capreomycin 1A

$r_{1B}$  = peak area response for capreomycin 1B

$r_T$  = total response for all peaks

**Acceptance criteria:** The capreomycin 1 content is NLT 90.0%.

• **PH <791>:** 4.5–7.5

**Sample solution:** 30 mg/mL

• **Loss on Drying <731>:** Dry 100 mg in a vacuum at a pressure not exceeding 5 mm of mercury at 100° for 4 h: it loses NMT 10.0% of its weight.

• **BACTERIAL ENDOTOXINS TEST <85>:** NMT 0.35 USP Endotoxin Unit/mg of capreomycin

• **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections* <1>, *Constituted Solutions*.

• **OTHER REQUIREMENTS:** It meets the requirements under *Injections* <1>.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in *Containers for Sterile Solids* as described under *Injections* <1>.

• **USP REFERENCE STANDARDS <11>**

USP Capreomycin Sulfate RS

USP Endotoxin RS

noids is not more than 15 percent, all calculated on the dried basis.

**Caution—Handle Capsaicin with care. Prevent inhalation of particles of it and prevent its contact with any part of the body.**

**Packaging and storage—**Preserve in tight containers, protected from light, and store in a cool place.

**Labeling—**Label it to state the percentage content of total capsaicinoids.

**USP Reference standards <11>—**

USP Capsaicin RS

USP Dihydrocapsaicin RS

**Identification—**Prepare a test solution of Capsaicin in methanol containing 1 mg per mL. Prepare a Standard solution of USP Capsaicin RS in methanol containing 1 mg per mL. Separately apply 10-μL portions of the test solution and the Standard solution to a thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatograms in a solvent system consisting of a mixture of ether and methanol (19:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and allow it to air-dry. Spray the plate with a 0.5% solution of 2,6-dibromoquinone-chlorimide in methanol, allow to stand in a chamber containing ammonia fumes, and examine the chromatograms: the blue color and the  $R_f$  value of the principal spot obtained from the test solution correspond to those properties of the principal spot obtained from the Standard solution.

**Melting range <741>:** between 57° and 66°, but the range between beginning and end of melting does not exceed 5°.

**Loss on drying <731>:** Dry it in vacuum over phosphorus pentoxide at 40° for 5 hours: it loses not more than 1.0% of its weight.

**Residue on ignition <281>:** not more than 1.0%.

**Content of capsaicin, dihydrocapsaicin, and other capsaicinoids—**

**Mobile phase—**Prepare a mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (600:400). Pass through a filter having a porosity of 0.5 μm or finer, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard capsaicin solution—**Quantitatively dissolve an accurately weighed quantity of USP Capsaicin RS in methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

**Standard dihydrocapsaicin solution—**Quantitatively dissolve an accurately weighed quantity of USP Dihydrocapsaicin RS in methanol to obtain a solution having a known concentration of about 0.025 mg per mL.

**Test solution—**Transfer about 25 mg of Capsaicin, accurately weighed, to a 250-mL volumetric flask, dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 281-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L11 and is maintained at a constant temperature of about 30°. Adjust the flow rate to obtain a retention time of about 20 minutes for the main capsaicin peak. Chromatograph the *Standard capsaicin solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2%.

**Procedure—**Separately inject equal volumes (about 20 μL) of the *Standard capsaicin solution*, the *Standard dihydrocapsaicin solution*, and the *Test solution* into the chromatograph, record the chromatogram for a period of time that is twice that of the retention time of capsaicin, and measure the areas of the responses for all of the peaks. Calculate the

## Capsaicin

$C_{18}H_{27}NO_3$  305.41

6-Nonenamide, (*E*)-*N*-[(4-Hydroxy-3-methoxyphenyl)methyl]-8-methyl.

(*E*)-8-Methyl-*N*-vanillyl-6-nonenamide [404-86-4].

» Capsaicin contains not less than 90.0 percent and not more than 110.0 percent of the labeled percentage of total capsaicinoids. The content of capsaicin ( $C_{18}H_{27}NO_3$ ) is not less than 55 percent, and the sum of the contents of capsaicin and dihydrocapsaicin ( $C_{18}H_{29}NO_3$ ) is not less than 75 percent, and the content of other capsaici-

percentage of capsaicin ( $C_{18}H_{27}NO_3$ ) in the portion of Capsaicin taken by the formula:

$$25,000(C / W)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Capsaicin RS in the *Standard capsaicin solution*;  $W$  is the weight, in mg, of Capsaicin taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the capsaicin peak responses obtained from the *Test solution* and the *Standard capsaicin solution*, respectively. Not less than 55% is found. Calculate the percentage of dihydrocapsaicin ( $C_{18}H_{29}NO_3$ ) in the portion of Capsaicin taken by the formula:

$$25,000(C / W)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Dihydrocapsaicin RS in the *Standard dihydrocapsaicin solution*;  $W$  is the weight, in mg, of Capsaicin taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the dihydrocapsaicin peak responses obtained from the *Test solution* and the *Standard dihydrocapsaicin solution*, respectively. The sum of the percentage of capsaicin found and of the percentage of dihydrocapsaicin found is not less than 75%. Using the chromatograms obtained from the *Standard capsaicin solution* and the *Test solution*, calculate the percentage of other capsaicinoids in the portion of Capsaicin taken by the formula:

$$25,000(C / W)(r_T / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Capsaicin RS in the *Standard capsaicin solution*;  $W$  is the weight, in mg, of Capsaicin taken to prepare the *Test solution*;  $r_T$  is the sum of the peak responses of the capsaicinoids other than capsaicin and dihydrocapsaicin in the chromatogram obtained from the *Test solution*; and  $r_S$  is the capsaicin peak response obtained from the *Standard capsaicin solution*. Not more than 15% of other capsaicinoids is found.

## Capsicum

### DEFINITION

Capsicum is the dried ripe fruit of *Capsicum frutescens* L., known in commerce as African chillies or as Tabasco pepper; or of *Capsicum annuum* L. var. *conoides* Irish; or of *Capsicum annuum* var. *longum* Sendt, known in commerce as Louisiana Long Pepper, or of a hybrid between the Honka variety of Japanese Capsicum and the Old Louisiana Sport Capsicum known in commerce as Louisiana Sport Pepper (Fam. Solanaceae).

### SPECIFIC TESTS

#### • BOTANIC CHARACTERISTICS

##### Macroscopic

**Unground Capsicum:** Occurs as oblong-conical fruits, often curved (Louisiana Long Pepper), usually laterally compressed, from 10 to 25 mm in length and from 4 to 8 mm in diameter (African Chillies), or up to 15 cm in length and 2.5 cm in diameter (Louisiana Long Pepper), or up to 5.5 cm in length and up to 13 mm in diameter (Louisiana Sport Pepper), or up to 4 cm in length and up to 9 mm in diameter (Tabasco Pepper). The fruit is two to three locular, the dissepiments being united at the base to a conical, central placenta. The pericarp is thin and membranous, its outer surface dark reddish brown to dusky yellowish orange, glabrous, shriveled, its inner surface striate with two to three distinct longitudinal ridges representing the parietal placentae; the seeds are light brown to weak yellowish orange, suborbicular or irregular, flattened, from 2 to 4 mm in diameter, with a thickened edge

and a prominent, pointed micropyle. The calyx is gamosepalous, inferior, five-toothed, and sometimes attached to a long, straight peduncle. Capsicum has a characteristic odor, and is sternutatory.

**Powdered Capsicum:** A dark orange or dark reddish orange to strong yellowish brown powder

##### Microscopic

**Unground Capsicum:** The epicarp of Capsicum consists of mostly quadrangular or rectangular cells up to 80  $\mu$ m in length and up to 20  $\mu$ m deep, arranged in regular rows, with thickened and cutinized outer and radial walls, the surface of the cuticle finely striated, the radial walls somewhat wavy (African Chillies), or of polygonal, quadrangular, triangular, or irregular cells up to 76  $\mu$ m in length and up to 30.5  $\mu$ m deep (Tabasco Pepper), or up to 125  $\mu$ m in length and up to 38  $\mu$ m deep (Louisiana Long Pepper), or up to 76  $\mu$ m in length and up to 38  $\mu$ m deep (Louisiana Sport Pepper), with cuticularized outer and radial walls, the latter usually prominently beaded. The mesocarp consists of thin-walled parenchyma (African Chillies), or an outer hypodermis of tangentially elongated collenchymatous cells (Louisiana Long Pepper and Tabasco Pepper), or of from one to three rows of hypodermal cells with cuticularized walls (Louisiana Sport Pepper), a broad middle zone of thin-walled parenchyma containing yellow to red chromoplasts, oil droplets, and elaioplasts, occasionally microcrystals, and traversed by vascular bundles, and an inner zone consisting of a layer of giant cells. The endocarp consists of a layer of elongated cells, some of them very thin-walled and containing chromoplasts and others in large oval areas with thickened, beaded, lignified walls. Epidermal cells of the seed are irregular in outline and up to 342  $\mu$ m in length, and have very sinuous, contorted, lignified walls, the cells from the edge of the seed being much thicker walled than those from the flat surface of the seed. The embryo is curved and embedded in the endosperm, the latter consisting of small-celled parenchyma containing fixed oil droplets and aleurone grains.

**Powdered Capsicum:** It shows numerous fragments of thin-walled parenchyma containing oil globules and orange, red, or yellow chromoplasts; and fragments of epicarp with either striated, rectangular cells arranged in parallel series (African Chillies), or with polygonal, triangular, or irregular cells, with or without beaded walls. The endocarp contains stone cells with slightly wavy, lignified walls and broad lumina. Numerous fragments of spermoderm composed of stone cells are present, showing in surface view, deeply sinuate, greatly thickened and lignified vertical walls containing numerous pore canals. Fragments of small-celled parenchyma of the endosperm containing fixed oil and aleurone grains, the latter up to 5.5  $\mu$ m in diameter, are also present, as well as occasional fibrovascular elements and calyx tissues.

- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter** (561): NMT 1%, other than stems and calyces, the proportion of which does not exceed 3%

#### • NONVOLATILE ETHER-SOLUBLE EXTRACTIVE

**Analysis:** Dry a sample of Capsicum, taken as directed under *Articles of Botanical Origin* (561), *Sampling*, over phosphorus pentoxide for NLT 12 h. Extract 2.0 g of dried Capsicum with anhydrous ether for 20 h in a continuous extraction apparatus. Transfer the ether solution to a tared porcelain dish, and allow it to evaporate spontaneously. Dry the residue, still in the tared dish, over phosphorus pentoxide for 18 h, and weigh to obtain the weight of the total ether extractive. Then heat the dish gradually up to 105°, until a constant weight is obtained.

**Acceptance criteria:** NLT 12% of nonvolatile ether-soluble extractive

- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 1.25%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. A few drops of chloroform may be added from time to time to prevent attack by insects.
- **LABELING:** Label each container to indicate which variety of Capsicum is contained therein.

### Capsicum Oleoresin

#### DEFINITION

Capsicum Oleoresin is an alcoholic extract of the dried ripe fruits of *Capsicum annum* var. *minimum* and small fruited varieties of *C. frutescens* (Fam. Solanaceae). It contains NLT 8.0% of total capsaicins [capsaicin ( $C_{18}H_{27}NO_3$ ), dihydrocapsaicin ( $C_{18}H_{29}NO_3$ ), and nordihydrocapsaicin ( $C_{17}H_{27}NO_3$ )].

[**CAUTION**—Capsicum Oleoresin is a powerful irritant, and even in minute quantities produces an intense burning sensation when it comes in contact with the eyes and tender parts of the skin. Care should be taken to protect the eyes and to prevent contact of the skin with Capsicum Oleoresin.]

#### IDENTIFICATION

- **A.**

**Sample:** 0.5 g of Capsicum Oleoresin

**Analysis:** To the *Sample*, add 5 mL of water and 10 mL of a mixture of water, 0.2 M potassium chloride, and 0.2 N hydrochloric acid (135:50:13). Mix. Add 5.0 mL of 0.5 M sodium nitrite and 5.0 mL of 0.02 M sodium tungstate, and mix. Heat the *Sample* at 55°–60° for 15 min, allow to cool, and filter. To the filtrate add 10 mL of 1 N sodium hydroxide.

**Acceptance criteria:** A bright yellow color is produced (presence of capsaicin).

#### ASSAY

- **PROCEDURE**

**Mobile phase:** Methanol and 2% acetic acid (56:44). Pass through a filter of 0.5- $\mu$ m or finer pore size.

**Standard solution:** 0.5 mg/mL of USP Capsaicin RS in methanol. Pass a portion of this solution through a filter of 0.2- $\mu$ m pore size, and use the filtrate as the *Standard solution*.

**Sample solution:** 10 mg/mL of Capsicum Oleoresin in methanol. Pass a portion of this solution through a filter of 0.2- $\mu$ m pore size, and use the filtrate as the *Sample solution*.

**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 2 mL/min

**Injection size:** 10  $\mu$ L

**System suitability**

**Samples:** *Standard solution* and *Sample solution*  
[NOTE—The relative retention times for nordihydrocapsaicin, capsaicin, and dihydrocapsaicin are about 0.9, 1.0, and 1.6, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.2 between nordihydrocapsaicin and capsaicin, *Sample solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 2.0% in repeated injections, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of total capsaicins in the portion of Capsicum Oleoresin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = sum of the peak areas for nordihydrocapsaicin, capsaicin, and dihydrocapsaicin from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Capsaicin RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Capsicum Oleoresin in the *Sample solution* (mg/mL)

**Acceptance criteria:** NLT 8.0%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate that if separation occurs, it should be warmed and mixed before use.
- **USP REFERENCE STANDARDS (11)**  
USP Capsaicin RS

### Captopril

$C_9H_{15}NO_3S$  217.29  
L-Proline, 1-[(2S)-3-mercapto-2-methyl-1-oxopropyl]-.  
1-[(2S)-3-Mercapto-2-methylpropionyl]-L-proline  
[62571-86-2].

» Captopril contains not less than 97.5 percent and not more than 102.0 percent of  $C_9H_{15}NO_3S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards (11)**—

USP Captopril RS

USP Captopril Disulfide RS

**Identification, Infrared Absorption (197K).**

**Specific rotation (781S):** between  $-125^\circ$  and  $-134^\circ$ .

*Test solution:* 10 mg per mL, in dehydrated alcohol.

**Loss on drying (731)**—Dry it in vacuum at 60° for 3 hours; it loses not more than 1.0% of its weight.

**Residue on ignition (281):** not more than 0.2%.

**Heavy metals, Method II (231):** 0.003%.

**Related compounds**—

**Mobile phase**—Prepare a filtered and degassed mixture of a 9 in 100 solution of tetrahydrofuran in methanol and a 1 in 2000 solution of phosphoric acid in water (33:67). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Resolution solution**—Dissolve USP Captopril RS, USP Captopril Disulfide RS, and 3-acetylthio-2-methylpropanoic acid in methanol to obtain a stock solution containing about 0.1 mg of each per mL. Quantitatively dilute a portion of this stock solution with methanol to obtain a solution containing about 10  $\mu$ g of each Reference Standard per mL.

**Standard solution**—[NOTE—Use low-actinic glassware.] Dissolve an accurately weighed quantity of USP Captopril Disulfide RS in methanol and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of 10  $\mu$ g per mL.

**Test solution**—[NOTE—Use low-actinic glassware.] Transfer 50 mg of Captopril, accurately weighed, to a 25-mL volumetric flask. Dissolve the specimen in methanol, dilute with methanol to volume, mix, and use the solution promptly.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution* (about 20 µL), and record the peak responses as directed for *Procedure*: the relative retention times are about 0.32 for captopril, 0.42 for 3-acetylthio-2-methylpropanoic acid, and 1.0 for captopril disulfide; and the resolution, *R*, between captopril and 3-acetylthio-2-methylpropanoic acid is not less than 3.0.

**Procedure**—[NOTE—Use the peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of captopril disulfide in the portion of Captopril taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in µg per mL, of USP Captopril Disulfide RS in the *Standard solution*;  $C_U$  is the concentration, in µg per mL, of Captopril in the *Test solution*; and  $r_U$  and  $r_S$  are the captopril disulfide peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1.0% of the captopril disulfide is found. Compare the peak responses, excluding those of the solvent, captopril, and captopril disulfide, in the chromatogram of the *Test solution* with the main peak response in the chromatogram of the *Standard solution*: the peak response of each impurity does not exceed 40% of the main peak response in the chromatogram of the *Standard solution* (0.2%), and the sum of the impurity peak responses does not exceed the main peak response in the chromatogram of the *Standard solution* (0.5%).

#### Assay—

**0.1 N Potassium iodate titrant**—Dissolve 3.567 g of potassium iodate, previously dried at 110° to constant weight, in water to make 1000.0 mL.

**Procedure**—Dissolve about 300 mg of Captopril, accurately weighed, in 100 mL of water in a suitable glass-stoppered flask, add 10 mL of 3.6 N sulfuric acid, 1 g of potassium iodide, and 2 mL of starch TS. Titrate with 0.1 N Potassium iodate titrant to a faint blue endpoint that persists for not less than 30 seconds. Perform a blank determination (see *Titrimetry* <541>), and make any necessary correction. Each mL of 0.1 N Potassium iodate titrant is equivalent to 21.73 mg of  $C_9H_{15}NO_3S$ .

### Captopril Oral Solution

» Captopril Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of captopril ( $C_9H_{15}NO_3S$ ). Prepare Captopril Oral Solution 0.75 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>). See also *Captopril Oral Suspension*:

Captopril powder . . . . .	75 mg
Vehicle for Oral Solution (regular or sugar-free), <i>NF</i> , a sufficient quantity to make . . . . .	100 mL

Add Captopril powder and about 10 mL of Vehicle to a mortar, and mix. Add the Vehicle in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough Vehicle to bring to final volume, and mix well.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store in a cold place.

**Labeling**—Label it to state the beyond-use date.

**USP Reference standards** <11>—

USP Captopril RS

**pH** <791>: between 3.8 and 4.3.

**Beyond-use date:** 7 days after the day on which it was compounded.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (11:9) containing 0.5 mL of phosphoric acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve USP Captopril RS in water to obtain a solution having a known concentration of 7.5 µg per mL.

**Assay preparation**—Agitate the container of Oral Solution for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at −70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the retention time is about 5.0 minutes; and the relative standard deviation for replicate injections is not more than 0.9%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of captopril ( $C_9H_{15}NO_3S$ ) in the volume of Oral Solution taken by the formula:

$$100(C / V)(r_U / r_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Captopril RS in the *Standard preparation*;  $V$  is the volume, in mL, of Oral Solution taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Captopril Oral Suspension

» Captopril Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of captopril

(C<sub>9</sub>H<sub>15</sub>NO<sub>3</sub>S). Prepare Captopril Oral Suspension 0.75 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795). See also *Captopril Oral Solution*):

Captopril .....	75 mg
Vehicle: a mixture of Vehicle for Oral Solution, (regular or sugar-free), <i>NF</i> and Vehicle for Oral Suspension, <i>NF</i> (1:1), a sufficient quantity to make .....	100 mL

If using Tablets place the required number of Captopril Tablets in a suitable mortar and comminute to a fine powder, or add Captopril powder to the mortar. Add about 10 mL of the Vehicle, and mix to a uniform paste. Add the Vehicle in small portions, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient Vehicle to bring to final volume, and mix well.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store in a cold place.

**Labeling**—Label it to state that it is to be well shaken, and to state the beyond-use date.

**USP Reference standards** (11)—

USP Captopril RS

**pH** (791): between 3.8 and 4.3.

**Beyond-use date:** 7 days after the day on which it was compounded.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (11:9) containing 0.5 mL of phosphoric acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve USP Captopril RS in water to obtain a solution having a known concentration of 7.5 µg per mL.

**Assay preparation**—Agitate the container of Oral Suspension for 30 minutes on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at –70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 seconds. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the retention time is about 5.0 minutes, and the relative standard deviation for replicate injections is not more than 0.9%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of captopril (C<sub>9</sub>H<sub>15</sub>NO<sub>3</sub>S) in the volume of Oral Suspension taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Captopril RS in the *Standard preparation*; V is the volume, in mL, of Oral Suspension taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Captopril Tablets

» Captopril Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of captopril (C<sub>9</sub>H<sub>15</sub>NO<sub>3</sub>S).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Captopril RS

USP Captopril Disulfide RS

**Thin-layer chromatographic identification test** (201)—

**Test solution**—Transfer a portion of powdered Tablets, equivalent to about 100 mg of captopril, to a conical flask. Add 25 mL of methanol, stir for 30 minutes using a magnetic stirrer, and centrifuge. Use the clear supernatant.

**Standard solution:** 4 mg per mL, in methanol.

**Application volume:** 50 µL, as streaks.

**Developing solvent system:** a mixture of toluene, glacial acetic acid, and methanol (75:25:1).

**Procedure**—Proceed as directed in the chapter. Locate the spots on the plate by lightly spraying with a freshly prepared mixture of 1 volume of ammonium hydroxide and 6 volumes of a solution of 0.04% 5,5'-dithiobis(2-nitrobenzoic acid) in methanol.

**Dissolution** (711)—[NOTE—Completely deaerate the *Dissolution Medium* to minimize exposure of captopril to air, and analyze the samples immediately.]

**Medium:** 0.01 N hydrochloric acid; 900 mL.

**Apparatus 1:** 50 rpm.

**Time:** 20 minutes.

**Procedure**—Determine the amount of C<sub>9</sub>H<sub>15</sub>NO<sub>3</sub>S dissolved by employing UV absorption at the wavelength of maximum absorbance at about 205 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Captopril RS in the same *Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of C<sub>9</sub>H<sub>15</sub>NO<sub>3</sub>S is dissolved in 20 minutes.

**Uniformity of dosage units** (905): meets the requirements.

**Limit of captopril disulfide**—[NOTE—Protect solutions from exposure to air. Use within 8 hours of preparation.]

**Mobile phase**—Proceed as directed in the *Assay*.

**System suitability solution**—Dissolve suitable quantities of USP Captopril RS and USP Captopril Disulfide RS in *Mobile phase* to obtain a solution having known concentrations of about 1 mg per mL and 0.05 mg per mL, respectively.

**Standard solution**—Dissolve an accurately weighed quantity of USP Captopril Disulfide RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

**Test solution**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the

powder, equivalent to about 25 mg of captopril, to a suitable centrifuge tube. Add 25.0 mL of *Mobile phase*, sonicate for 15 minutes, and centrifuge. Use the clear supernatant as the *Test solution*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1 with about 15% hydrocarbon load. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution* and the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for captopril and 1.0 for captopril disulfide; the resolution, *R*, between captopril and captopril disulfide in the *System suitability solution* is not less than 2.0; and the relative standard deviation for replicate injections of the *Standard solution* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of captopril disulfide in the portion of Tablets taken by the formula:

$$2500C / W(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Captopril Disulfide RS in the *Standard solution*; *W* is the quantity, in mg, of captopril in the portion of Tablets taken to prepare the *Test solution*, based on the labeled amount per Tablet; and *r<sub>U</sub>* and *r<sub>S</sub>* are the captopril disulfide peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 3.0% is found.

**Assay**—[NOTE—Protect solutions from exposure to air. Use within 8 hours of preparation.]

**Mobile phase**—Prepare a filtered and degassed mixture of 550 mL of methanol and 450 mL of water containing 0.50 mL of phosphoric acid. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve suitable quantities of USP Captopril RS and USP Captopril Disulfide RS in *Mobile phase* to obtain a solution having known concentrations of about 1 mg per mL and 0.05 mg per mL, respectively.

**Assay preparation**—Transfer not fewer than 20 Tablets to a suitable volumetric flask, add *Mobile phase* to fill the flask to about half of its capacity, and sonicate for 15 minutes. Dilute with *Mobile phase* to volume, shake by mechanical means for 15 minutes, and filter. Dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 1 mg of captopril per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1 with about 15% hydrocarbon load. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for captopril and 1.0 for captopril disulfide; the resolution, *R*, between captopril and captopril disulfide is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of captopril (C<sub>9</sub>H<sub>15</sub>NO<sub>3</sub>S) in the portion of Tablets taken by the formula:

$$(L / D)C(r_U / r_S)$$

in which *L* is the labeled amount, in mg, of captopril in each Tablet; *D* is the concentration, in mg per mL, of captopril in the *Assay preparation* based on the labeled quantity per Tablet and the extent of dilution; *C* is the con-

centration, in mg per mL, of USP Captopril RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the captopril peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Captopril and Hydrochlorothiazide Tablets

» Captopril and Hydrochlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of captopril (C<sub>9</sub>H<sub>15</sub>NO<sub>3</sub>S) and hydrochlorothiazide (C<sub>7</sub>H<sub>8</sub>ClN<sub>3</sub>O<sub>4</sub>S<sub>2</sub>).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Benzothiadiazine Related Compound A RS  
4-Amino-6-chloro-1,3-benzenedisulfonamide.  
C<sub>6</sub>H<sub>8</sub>ClN<sub>3</sub>O<sub>4</sub>S<sub>2</sub> 285.73

USP Captopril RS

USP Captopril Disulfide RS

USP Hydrochlorothiazide RS

**Identification**—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those of the *Standard preparation* obtained as directed in the *Assay*.

**Dissolution** <711>—

*Medium*: 0.1 N hydrochloric acid; 900 mL.

*Apparatus 1*: 50 rpm.

*Times*: 20 minutes for captopril; 30 minutes for hydrochlorothiazide.

**Procedure**—Determine the amounts of C<sub>9</sub>H<sub>15</sub>NO<sub>3</sub>S and C<sub>7</sub>H<sub>8</sub>ClN<sub>3</sub>O<sub>4</sub>S<sub>2</sub> dissolved, employing the procedure set forth in the *Assay*. Use filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, and compare with a *Standard solution* having known concentrations of USP Captopril RS and USP Hydrochlorothiazide RS in the same medium.

**Tolerances**—Not less than 80% (*Q*) of the labeled amount of captopril (C<sub>9</sub>H<sub>15</sub>NO<sub>3</sub>S) is dissolved in 20 minutes, and not less than 60% (*Q*) of the labeled amount of hydrochlorothiazide (C<sub>7</sub>H<sub>8</sub>ClN<sub>3</sub>O<sub>4</sub>S<sub>2</sub>) is dissolved in 30 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Limit of captopril disulfide**—

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and phosphoric acid (550:450:0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard solution**—Dissolve an accurately weighed quantity of USP Captopril Disulfide RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 15 µg per mL.

**Test solution**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 25 mg of captopril, to a 50-mL volumetric flask, add about 20 mL of *Mobile phase*, and sonicate for 15 minutes, with occasional shaking. Dilute with *Mobile phase* to volume, mix, and centrifuge. Use the clear supernatant as the *Test solution*.

**System suitability solution**—Prepare a solution in *Mobile phase* containing about 0.0075 mg per mL of USP Captopril RS and USP Hydrochlorothiazide RS, and 0.015 mg per mL of USP Captopril Disulfide RS.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 210-nm detector

and a column that contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.3 for captopril and 1.0 for captopril disulfide. The resolution,  $R$ , between the captopril and captopril disulfide peaks is not less than 4.0, and both peaks are resolved from the hydrochlorothiazide peak. Chromatograph the *Standard solution*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the captopril disulfide peaks. Calculate the percentage of captopril disulfide in the portion of Tablets taken by the formula:

$$(5C/W)(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Captopril Disulfide RS in the *Standard solution*;  $W$  is the quantity, in mg, of captopril in the portion of Tablets taken to prepare the *Test solution*, based on the labeled amount per Tablet; and  $r_U$  and  $r_S$  are the captopril disulfide peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 3.0% is found.

#### Limit of benzothiadiazine related compound A—

*Mobile phase*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the Assay.

**Standard solution**—Dissolve an accurately weighed quantity of USP Benzothiadiazine Related Compound A RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 10  $\mu$ g per mL.

**Test solution**—Use the Assay preparation

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the benzothiadiazine related compound A peaks. Calculate the percentage of benzothiadiazine related compound A in the portion of Tablets taken by the formula:

$$(5C/W)(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Benzothiadiazine Related Compound A RS in the *Standard solution*;  $W$  is the quantity, in mg, of hydrochlorothiazide in the portion of Tablets taken to prepare the *Test solution*, based on the labeled amount per Tablet; and  $r_U$  and  $r_S$  are the benzothiadiazine related compound A peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1.0% is found.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and phosphoric acid (750:250:0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve accurately weighed quantities of USP Captopril RS and USP Hydrochlorothiazide RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 0.3 mg of USP Hydrochlorothiazide RS per mL and about 0.3/  $J$  mg of USP Captopril RS per mL,  $J$  being the ratio of the labeled amount, in mg, of captopril to the labeled amount, in mg, of hydrochlorothiazide per Tablet.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 15 mg of hydrochlorothiazide, to a 50-mL volumetric flask, add *Mobile phase*, and sonicate for 15 minutes with occasional shaking. Dilute with *Mobile phase* to volume, mix, and centrifuge.

**System suitability solution**—Prepare a solution in *Mobile phase* containing about 0.3 mg each of USP Captopril RS, USP Hydrochlorothiazide RS, and USP Benzothiadiazine Related Compound A RS per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm  $\times$  30-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.4 for benzothiadiazine related compound A, 0.5 for hydrochlorothiazide, and 1.0 for captopril. The resolution,  $R$ , between the void volume and the benzothiadiazine related compound A peak is not less than 1.7, the resolution,  $R$ , between the benzothiadiazine related compound A and hydrochlorothiazide peaks is not less than 1.8, and the resolution,  $R$ , between the captopril and hydrochlorothiazide peaks is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg, of captopril ( $C_9H_{15}NO_3S$ ) and hydrochlorothiazide ( $C_7H_8ClN_3O_4S_2$ ) in the portion of Tablets taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the responses of the corresponding analyte peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Carbachol

$C_6H_{15}ClN_2O_2$  182.65  
Ethanaminium, 2-[(aminocarbonyl)oxy]-*N,N,N*-trimethyl-, chloride.  
Choline chloride, carbamate [51-83-2].

» Carbachol contains not less than 99.0 percent and not more than 101.0 percent of  $C_6H_{15}ClN_2O_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Carbachol RS

**Identification**—

A: *Infrared Absorption* (197K).

B: A solution (1 in 20) meets the requirements for the silver nitrate precipitate test for *Chloride* (191).

**Melting range** (741): between 200° and 204°, with some decomposition.

**Loss on drying** (731)—Dry about 1 g, accurately weighed, at 105° for 2 hours: it loses not more than 2.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Ordinary impurities** (466)—

**Test solution**: a mixture of methanol and water (4:1).

**Standard solution**: a mixture of methanol and water (4:1).

*Eluant:* alcohol.

*Visualization:* 16.

**Assay**—Dissolve about 400 mg of Carbachol, accurately weighed, in a mixture of 10 mL of glacial acetic acid and 10 mL of mercuric acetate TS. Add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 18.27 mg of  $C_6H_{15}ClN_2O_2$ .

## Carbachol Intraocular Solution

» Carbachol Intraocular Solution is a sterile solution of Carbachol in an aqueous medium. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of  $C_6H_{15}ClN_2O_2$ . It contains no preservatives or antimicrobial agents.

**Packaging and storage**—Preserve in tight containers, at controlled room temperature, and protect from freezing.

**Labeling**—Label it to indicate that it is for single-dose intraocular use only, and that the unused portion is to be discarded.

**USP Reference standards** (11)—  
USP Carbachol RS

**Identification**—To 5 mL of Intraocular Solution, add 4 or 5 drops of saturated (filtered) ammonium reineckate solution: a pink precipitate is formed that is soluble in acetone; the acetone solution is red.

**Sterility** (71): meets the requirements.

**pH** (791): between 5.0 and 7.5.

**Assay**—

*Hypochlorite reagent and Standard preparation*—Prepare as directed in the Assay under Carbachol Ophthalmic Solution.

*Assay preparation*—Dilute, if necessary, an accurately measured volume of Intraocular Solution quantitatively and stepwise with water to obtain a solution containing about 100  $\mu$ g of carbachol per mL.

*Procedure*—Proceed as directed for Procedure in the Assay under Carbachol Ophthalmic Solution.

## Carbachol Ophthalmic Solution

» Carbachol Ophthalmic Solution is a sterile solution of Carbachol in an isotonic, aqueous medium. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_6H_{15}ClN_2O_2$ . It may contain suitable preservatives and antimicrobial agents.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—  
USP Carbachol RS

**Identification**—Dilute the test article to a concentration of about 1 mg of carbachol per mL. Add 5 mL of ammonium reineckate solution (1 in 30), and shake vigorously for 1 minute: a red precipitate soluble in acetone is formed.

**Sterility** (71): meets the requirements.

**pH** (791): between 5.0 and 7.0.

**Assay**—

*Hypochlorite reagent*—Dilute 1 volume of sodium hypochlorite TS with water to 15 volumes, allow to stand for 30 minutes, then mix equal volumes of the resulting solution and 1 N sodium hydroxide. Prepare fresh daily.

*Standard preparation*—Dissolve a suitable quantity of USP Carbachol RS, accurately weighed, in water, and dilute quantitatively and stepwise with water to obtain a solution having a known concentration of about 100  $\mu$ g per mL.

*Assay preparation*—Dilute an accurately measured volume of Ophthalmic Solution quantitatively and stepwise with water to obtain a solution containing about 100  $\mu$ g of carbachol per mL.

*Procedure*—Transfer 2.0-mL portions each of the Assay preparation and the Standard preparation, and of water to provide a blank, to separate 50-mL conical flasks. To each flask add 1.0 mL of 0.1 N hydrochloric acid, and mix. Treat each as follows. Add 4.0 mL of Hypochlorite reagent, rinsing the inner walls of the flask with small portions of water, mix, and allow to stand for 15 minutes, accurately timed. Add 2.0 mL of phenol solution (1 in 200), rinsing the walls of the flask with the solution and with additional small portions of water. Mix, and allow to stand for 5 minutes. Add 2.0 mL of 3.5 N hydrochloric acid, washing the sides of the flask upon addition. Rinse the flask sparingly with 0.1 N hydrochloric acid to assure complete acidification of all contents, then mix. Add 1.0 mL of potassium iodide solution (3 in 1000), mix, and allow to stand for 5 minutes. Add 3.0 mL of starch TS, mix, transfer the solutions to 50-mL volumetric flasks with the aid of several small portions of water, and dilute each solution with water to volume. Concomitantly determine the absorbances of the solutions from the Assay preparation and the Standard preparation in 1-cm cells at the wavelength of maximum absorbance at about 590 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of  $C_6H_{15}ClN_2O_2$  in each mL of the Ophthalmic Solution taken by the formula:

$$0.001 CD(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Carbachol RS in the Standard preparation, D is the dilution factor used in the Assay preparation, and  $A_U$  and  $A_S$  are the absorbances of the solutions from the Assay preparation and the Standard preparation, respectively.

## Carbamazepine

$C_{15}H_{12}N_2O$  236.27

5*H*-Dibenz[*b,f*]azepine-5-carboxamide.

5*H*-Dibenz[*b,f*]azepine-5-carboxamide [298-46-4].

» Carbamazepine contains not less than 98.0 percent and not more than 102.0 percent of  $C_{15}H_{12}N_2O$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Carbamazepine RS

USP Carbamazepine Related Compound A RS  
10,11-Dihydrocarbamazepine.

USP Carbamazepine Related Compound B RS  
Iminostilbene.

**Identification, Infrared Absorption** (197M).

**X-ray diffraction** (941)—The X-ray diffraction pattern conforms to that of USP Carbamazepine RS, similarly determined.

**Acidity**—Add 2.0 g to 40.0 mL of water, mix for 15 minutes, and filter through paper. To a 10.0-mL aliquot of the solution so obtained add 1 drop of phenolphthalein TS, and titrate with 0.01 N sodium hydroxide VS from a 10-mL buret. Perform a blank determination, and make any necessary correction. Not more than 1.0 mL of 0.010 N sodium hydroxide is required for each 1.0 g of Carbamazepine.

**Alkalinity**—To a 10.0-mL aliquot of the solution prepared in the test for *Acidity* add 1 drop of methyl red TS, and titrate with 0.01 N hydrochloric acid VS from a 10-mL buret. Perform a blank determination, and make any necessary correction. Not more than 1.0 mL of 0.010 N hydrochloric acid is required for each 1.0 g of Carbamazepine.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%, a 2.0-g test specimen being used.

**Chloride** (221)—Boil 1.0 g with 20.0 mL of water for 10 minutes, cool, again adjust the volume, and filter: a 10.0-mL portion of the filtrate shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (0.014%).

**Heavy metals, Method II** (231): 0.001%.

**Related compounds—**

*Mobile phase and System suitability solution*—Proceed as directed in the Assay.

*Standard solution*—Dissolve accurately weighed quantities of USP Carbamazepine RS, USP Carbamazepine Related Compound A RS, and USP Carbamazepine Related Compound B RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having known concentrations of about 0.02 mg per mL of each component. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with a mixture of methanol and water (50:50) to volume, and mix.

*Test solution*—Transfer about 100 mg of Carbamazepine, accurately weighed, to a 50-mL volumetric flask, and dissolve in and dilute with methanol to volume. Transfer 25.0 mL of this solution to a 50-mL volumetric flask, add about 20 mL of water, and shake. Allow the mixture to cool to room temperature, and dilute with water to volume.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between carbamazepine related compound A and carbamazepine is not less than 1.70; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantities, in mg, of carbamazepine related compound A and carbamazepine related compound B in the portion of Carbamazepine taken by the formula:

$$100C(r_i / r_{Si})$$

in which  $C$  is the concentration, in mg per mL, of carbamazepine related compound A or carbamazepine related compound B in the *Standard solution*; and  $r_i$  and  $r_{Si}$  are the peak responses obtained for either carbamazepine related compound A or carbamazepine related compound B from the *Test solution* and the corresponding peak obtained from the *Standard solution*, respectively. Calculate the quantities, in

mg, of all other impurities found in the portion of Carbamazepine taken by the formula:

$$100C(r_i / r_s)$$

in which  $r_i$  is the peak response for any other impurity; and  $r_s$  is the peak response for carbamazepine obtained from the *Standard solution*: not more than 0.2% of any individual impurity is found; and the total of all impurities (including carbamazepine related compound A and carbamazepine related compound B) is not more than 0.5%.

**Assay—**

*Mobile phase*—Prepare a 1000-mL mixture of water, methanol, and tetrahydrofuran (85:12:3), add 0.22 mL of formic acid, mix, then add 0.5 mL of triethylamine, and mix. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve accurately weighed quantities of USP Carbamazepine RS and USP Carbamazepine Related Compound A RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having known concentrations of about 0.1 and 0.5 mg per mL, respectively. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, and dilute with a mixture of methanol and water (1:1) to volume.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Carbamazepine RS in methanol, and dilute quantitatively with methanol to obtain a solution having a known concentration of about 2 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, and dilute with a mixture of methanol and water (1:1) to volume.

*Assay preparation*—Transfer about 100 mg of Carbamazepine, accurately weighed, to a 50-mL volumetric flask, and dissolve in and dilute with methanol to volume. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, and dissolve in and dilute with a mixture of methanol and water (1:1) to volume.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation* and the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between carbamazepine related compound A and carbamazepine in the *System suitability solution* is not less than 1.70; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{15}H_{12}N_2O$  in the portion of Carbamazepine taken by the formula:

$$500C(r_u / r_s)$$

in which  $C$  is the concentration, in mg per mL, of USP Carbamazepine RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

## Carbamazepine Oral Suspension

---

» Carbamazepine Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of carbamazepine ( $C_{15}H_{12}N_2O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, protected from freezing and from excessive heat.

**USP Reference standards** (11)—

USP Carbamazepine RS

**Identification, Infrared Absorption** (197S)—

**Solution**—Place 5 mL of Oral Suspension in a separator containing 20 mL of 0.1 N sodium hydroxide, and extract with 25 mL of chloroform. Pass the extract through anhydrous sodium sulfate supported on filter paper into a beaker. Wash the anhydrous sodium sulfate with 10 mL of chloroform, and add the washing to the extract. Evaporate the chloroform extract with the aid of a stream of nitrogen to dryness. Dissolve the residue in 10 mL of methylene chloride.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—The total bacterial count does not exceed 100 cfu per g, and the tests for *Salmonella* species and *Escherichia coli* are negative.

**Uniformity of dosage units** (90S)—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Assay**—

*Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under Carbamazepine.

**Assay preparation**—Transfer an accurately measured volume of freshly mixed Oral Suspension, equivalent to about 200 mg of carbamazepine, to a 100-mL volumetric flask, add about 70 mL of methanol, shake by mechanical means for about 30 minutes, sonicate for about 2 minutes, dilute with methanol to volume, and mix. Allow the solution to stand for about 10 minutes, transfer 10.0 mL of the clear solution to a 100-mL volumetric flask, dilute with methanol to volume, and mix. This is the final *Assay preparation*. For system suitability determination, transfer 10.0 mL of this solution to a suitable container, add 10.0 mL of *System suitability solution*, and mix.

**Procedure**—Proceed as directed in the Assay under Carbamazepine. Calculate the quantity, in mg, of carbamazepine ( $C_{15}H_{12}N_2O$ ) in the portion of Oral Suspension taken by the formula:

$$10C(r_u / r_s)$$

in which the terms are as defined therein.

## Carbamazepine Tablets

» Carbamazepine Tablets contain not less than 92.0 percent and not more than 108.0 percent of the labeled amount of  $C_{15}H_{12}N_2O$ .

**Packaging and storage**—Preserve in tight containers, preferably of glass. Dispense Carbamazepine Tablets in a container labeled "Store in a dry place. Protect from moisture."

**Labeling**—The labeling indicates the *Dissolution* test with which the product complies.

**USP Reference standards** (11)—

USP Carbamazepine RS

**Identification**—Boil, in a 50-mL beaker, a quantity of powdered Tablets, equivalent to about 250 mg of carbamazepine, with 15 mL of acetone for 5 minutes. Filter while hot into a second beaker, using two 5-mL portions of hot ace-

tone to effect transfer. Evaporate with the aid of nitrogen to about 5 mL, and cool in an ice bath until crystals are formed. Filter the crystals, wash with 3 mL of cold acetone, and dry in vacuum at 70° for 30 minutes: the crystals so obtained respond to the *Identification* test under Carbamazepine.

**Dissolution** (711)—

FOR PRODUCTS LABELED AS 100-MG CHEWABLE TABLETS—

**TEST 1**—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

**Medium:** water containing 1% sodium lauryl sulfate; 900 mL.

**Apparatus 2:** 75 rpm.

**Time:** 60 minutes.

**Procedure**—Determine the amount of  $C_{15}H_{12}N_2O$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 288 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Carbamazepine RS in the same *Medium*. [NOTE—A volume of methanol not exceeding 1% of the final total volume of the Standard solution may be used to dissolve the carbamazepine.]

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{15}H_{12}N_2O$  is dissolved in 60 minutes. Use *Acceptance Table 1*, with the following exceptions: at  $S_2$ , no unit is less than  $Q - 5\%$ ; at  $S_3$ , no unit is less than  $Q - 10\%$ ; and not more than 2 of the 24 units are less than  $Q - 5\%$ .

FOR PRODUCTS LABELED AS 200-MG TABLETS—

**TEST 2**—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium, Apparatus, and Procedure**—Proceed as directed for Test 1.

**Times and Tolerances:** between 45% and 75% of the labeled amount of  $C_{15}H_{12}N_2O$  is dissolved in 15 minutes; not less than 75% (Q) of the labeled amount of  $C_{15}H_{12}N_2O$  is dissolved in 60 minutes. Use *Acceptance Table 2*, with the following exceptions: at 15 minutes—at  $L_2$ , no unit is more than 5% outside the stated range; at  $L_3$ , no unit is more than 10% outside the stated range; and not more than 2 of the 24 units are more than 5% outside the stated range. At 60 minutes—at  $L_2$ , no unit is less than  $Q - 5\%$ ; at  $L_3$ , no unit is less than  $Q - 10\%$ ; and not more than 2 of the 24 units are less than  $Q - 5\%$ .

**TEST 3**—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Medium, Apparatus, and Procedure**—Proceed as directed for Test 1.

**Times and Tolerances:** between 60% and 85% of the labeled amount of  $C_{15}H_{12}N_2O$  is dissolved in 15 minutes; not less than 75% (Q) of the labeled amount of  $C_{15}H_{12}N_2O$  is dissolved in 60 minutes. Use *Acceptance Table 2*, with the following exceptions: at 15 minutes—at  $L_2$ , no unit is more than 5% outside the stated range; at  $L_3$ , no unit is more than 10% outside the stated range; and not more than 2 of the 24 units are more than 5% outside the stated range. At 60 minutes—at  $L_2$ , no unit is less than  $Q - 5\%$ ; at  $L_3$ , no unit is less than  $Q - 10\%$ ; and not more than 2 of the 24 units are less than  $Q - 5\%$ .

**Uniformity of dosage units** (90S): meet the requirements.

**Water, Method III** (921)—Finely powder 20 Tablets, and accurately weigh about 1.5 g of the powder into a dry, tared evaporating dish. Dry at 120° for 2 hours: it loses not more than 5.0% of its weight.

**Assay**—

*Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Carbamazepine.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of carbamazepine, to a 50-mL volumetric flask, add about 40 mL of methanol, sonicate for about 15 minutes, allow to cool to room temperature, dilute with methanol to volume, mix, and filter, discarding the first 10 mL of the filtrate. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with a mixture of methanol and water (1:1) to volume, and mix.

**Procedure**—Proceed as directed in the Assay under *Carbamazepine*. Calculate the quantity, in mg, of carbamazepine ( $C_{15}H_{12}N_2O$ ) in the portion of Tablets taken by the formula:

$$500C(r_U / r_S)$$

in which the terms are as defined therein.

## Carbamazepine Extended-Release Tablets

» Carbamazepine Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of carbamazepine ( $C_{15}H_{12}N_2O$ ).

**Packaging and storage**—Preserve in tight container, and store at controlled room temperature.

**USP Reference standards** (11)—  
USP Carbamazepine RS

**Identification**—

**A: Ultraviolet Absorption** (197U)—

**Solution**—Use the *Test solution* prepared as directed in the test for *Uniformity of dosage units*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

**Medium:** water; 900 mL, 1800 mL for 400-mg Tablets.

**Apparatus 1:** 100 rpm.

**Times:** 3, 6, 12, and 24 hours.

**Procedure**—Determine the amount of  $C_{15}H_{12}N_2O$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 284 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Carbamazepine RS in the same *Medium*.

**Tolerances**—The percentages (*Q*) of the labeled amount of  $C_{15}H_{12}N_2O$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
3	between 10% and 35%
6	between 35% and 65%
12	between 65% and 90%
24	not less than 75%

**Uniformity of dosage units** (905): meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

**Standard stock solution**—Dissolve an accurately weighed quantity of USP Carbamazepine RS in methanol to obtain a solution containing 2 mg per mL.

**Standard solution**—Quantitatively dilute an accurately measured volume of *Standard stock solution* with methanol to obtain a solution having a known concentration of 10 µg per mL.

**Test solution**—Finely powder 1 Tablet, and quantitatively transfer the powder, with the aid of methanol, to a 100-mL volumetric flask. Add about 70 mL of methanol, and shake by mechanical means for 60 minutes. Sonicate for 15 minutes, and dilute with methanol to volume. Allow to stand for 10 to 15 minutes. Dilute a portion of the clear solution quantitatively, and stepwise if necessary, with methanol to obtain a solution containing about 10 µg of carbamazepine per mL.

**Procedure**—Concomitantly determine the absorbances of the *Test solution* and the *Standard solution* by employing UV absorption at the wavelength of maximum absorbance at about 284 nm, using methanol as a blank. Calculate the quantity, in mg, of carbamazepine ( $C_{15}H_{12}N_2O$ ) in the Tablet taken by the formula:

$$(LC / D)(A_U / A_S)$$

in which *L* is the labeled quantity, in mg, of carbamazepine in the Tablet; *C* is the concentration, in µg per mL, of USP Carbamazepine RS in the *Standard solution*; *D* is the concentration, in µg per mL, of the *Test solution*, based on the labeled quantity per Tablet and the extent of dilution; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances obtained from the *Test solution* and the *Standard solution*, respectively.

**Water, Method 1a** (921): not more than 5.0%.

**Limit of residual solvents**—

**Standard solution**—Dissolve accurately measured quantities of methanol and methylene chloride in dimethylformamide to obtain a solution having known concentrations of about 5 µg of each per mL.

**Test solution**—Finely powder 10 Tablets, and quantitatively transfer the powder to a 50-mL volumetric flask. Add about 30 mL of dimethylformamide, shake by mechanical means for 60 minutes, and sonicate for 2 minutes. Dilute with dimethylformamide to volume, and mix. Centrifuge a portion of the solution at about 2500 rpm for 20 minutes, and use the clear supernatant.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 3-m glass column containing 0.2% phase G39 on support S7. The injection port and detector temperatures are maintained at about 170° and 300°, respectively. The column temperature is programmed as follows. Initially it is maintained at 75° for 10 minutes, then increased at a rate of 20° per minute to 155°, and maintained at 155° for 30 minutes. The carrier gas is helium, flowing at a rate of about 10 mL per minute.

**Procedure**—Separately inject equal volumes (about 2 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the amount, in µg, of methylene chloride and methanol in each Tablet taken by the formula:

$$5C(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of methylene chloride or methanol in the *Standard solution*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the responses of the corresponding analyte obtained from the *Test solution* and the *Standard solution*, respectively: not more than 23 µg of methylene chloride per Tablet is found; and not more than 100 µg of methanol per Tablet is found.

**Chromatographic purity**—Not more than 0.2% of any individual impurity is found; and not more than 0.5% of total impurities is found, the results from both *Test 1* and *Test 2* being used.

## TEST 1—

**Mobile phase and Chromatographic system**—Prepare as directed in the Assay.

**System suitability solution**—Dissolve suitable quantities of phenytoin and USP Carbamazepine RS in methanol to obtain a solution containing about 0.6 and 0.2 mg per mL, respectively. Dilute this solution quantitatively, and stepwise if necessary, with methanol to obtain a solution containing about 60 µg of phenytoin and 20 µg of USP Carbamazepine RS per mL.

**Standard solution**—Dissolve an accurately weighed quantity of USP Carbamazepine RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 4 µg per mL.

**Test solution**—Use the Assay stock preparation.

**Procedure**—Separately inject equal volumes (about 10 µL) of the Test solution and the Standard solution into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(C_S / C_T)(r_i / r_s)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Carbamazepine RS in the Standard solution;  $C_T$  is the concentration, in mg per mL, of carbamazepine in the Test solution;  $r_i$  is the peak response of each impurity obtained from the Test solution; and  $r_s$  is the peak response for carbamazepine obtained from the Standard solution.

## TEST 2—

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and acetonitrile (10:7:3). Make adjustments if necessary (see System Suitability under Chromatography <621>).

**System suitability solution**—Dissolve suitable quantities of iminostilbene and USP Carbamazepine RS in methanol to obtain a solution containing about 12.5 and 5.0 µg per mL, respectively.

**Standard solution**—Use the Standard solution, prepared as directed for Test 1.

**Test solution**—Use the Assay stock preparation.

**Chromatographic system** (see Chromatography <621>)—Prepare as directed in the Assay. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.3 for carbamazepine and 1.0 for iminostilbene; the resolution,  $R$ , between carbamazepine and iminostilbene is not less than 10.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Proceed as directed for Test 1.

**Assay—**

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and methylene chloride (600:450:45). Make adjustments if necessary (see System Suitability under Chromatography <621>).

**Internal standard solution**—Prepare a solution of phenytoin in methanol containing about 600 µg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Carbamazepine RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 200 µg per mL. Pipet 10.0 mL of this solution into a conical flask, add 10.0 mL of Internal standard solution, mix, and filter. This solution contains about 100 µg of USP Carbamazepine RS per mL.

**System suitability solution**—Pipet equal volumes of Internal standard solution and Standard preparation into a suitable flask, and mix.

**Assay stock preparation**—Finely powder 10 Tablets, and quantitatively transfer the powder, with the aid of alcohol,

to a volumetric flask of such volume that when the solution is diluted to volume a final concentration estimated to be about 4 mg of carbamazepine per mL is obtained. Shake by mechanical means for 60 minutes. Sonicate for 15 minutes, and dilute with methanol to volume. Allow to stand for 10 to 15 minutes, then filter a portion of the supernatant, and use the clear filtrate.

**Assay preparation**—Transfer 5.0 mL of the Assay stock preparation to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Pipet 10.0 mL of this solution into a conical flask, add 10.0 mL of Internal standard solution, mix, and filter.

**Chromatographic system** (see Chromatography <621>)—The liquid chromatograph is equipped with a 230-nm detector, a 4.6-mm × 30-cm guard column that contains 7-µm packing L7, and a 3.9-mm × 30-cm column that contains packing L1. [NOTE—Wash the column with 50 to 100 mL of methanol before and after use.] The flow rate is about 2 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.8 for phenytoin, and 1.0 for carbamazepine; the resolution,  $R$ , between phenytoin and carbamazepine is not less than 2.8; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of carbamazepine ( $C_{15}H_{12}N_2O$ ) in each Tablet taken by the formula:

$$0.004(CV)(R_U / R_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Carbamazepine RS in the Standard preparation;  $V$  is the volume, in mL, of the volumetric flask used to prepare the Assay stock preparation; and  $R_U$  and  $R_S$  are the peak response ratios of carbamazepine to the internal standard obtained from the Assay preparation and the Standard preparation, respectively.

## Carbamide Peroxide

$CH_6N_2O_3$  94.07

Urea, compd. with hydrogen peroxide (1:1).

Urea compound with hydrogen peroxide (1:1) [124-43-6].

» Carbamide Peroxide contains not less than 96.0 percent and not more than 102.0 percent of  $CH_6N_2O_3$ .

**Packaging and storage**—Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

**Identification—**

**A:** Mix 1 mL of a solution (1 in 10) of it with 1 mL of nitric acid: a white, crystalline precipitate is formed.

**B:** A solution of it (1 in 10) responds to the tests for Peroxide <191>.

**Assay**—Transfer about 100 mg of Carbamide Peroxide, accurately weighed, to a 500-mL iodine flask with the aid of 25 mL of water, add 5 mL of glacial acetic acid, and mix. Add 2 g of potassium iodide and 1 drop of ammonium molybdate TS, insert the stopper, and allow to stand in the dark for 10 minutes. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the

endpoint is approached. Each mL of 0.1 N sodium thiosulfate is equivalent to 4.704 mg of  $\text{CH}_6\text{N}_2\text{O}_3$ .

## Carbamide Peroxide Topical Solution

» Carbamide Peroxide Topical Solution is a solution in anhydrous glycerin of Carbamide Peroxide or of carbamide peroxide prepared from hydrogen peroxide and Urea. It contains not less than 78.0 percent and not more than 110.0 percent, by weight, of the labeled amount of  $\text{CH}_6\text{N}_2\text{O}_3$ .

**Packaging and storage**—Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

### Identification—

**A:** Mix 1 mL with 1 mL of nitric acid: a white, crystalline precipitate is formed.

**B:** It responds to the tests for *Peroxide* (191).

**Specific gravity** (841): between 1.245 and 1.272.

**pH** (791): between 4.0 and 7.5.

**Assay**—Transfer an accurately weighed quantity of Topical Solution, equivalent to about 100 mg of carbamide peroxide, to a 500-mL iodine flask with the aid of 25 mL of water, add 5 mL of glacial acetic acid, and mix. Add 2 g of potassium iodide and 1 drop of ammonium molybdate TS, and allow to stand in the dark for 10 minutes. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N sodium thiosulfate is equivalent to 4.704 mg of  $\text{CH}_6\text{N}_2\text{O}_3$ .

## Carbenicillin Disodium

$\text{C}_{17}\text{H}_{16}\text{N}_2\text{Na}_2\text{O}_6\text{S}$  (anhydrous) 422.36

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 6-[(carboxyphenylacetyl)amino]-3,3-dimethyl-7-oxo-, disodium salt, [2S-(2 $\alpha$ ,5 $\alpha$ ,6 $\beta$ )]-

N-(2-Carboxy-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo.[3.2.0]-hept-6-yl)-2-phenylmalonamic acid disodium salt [4800-94-6].

» Carbenicillin Disodium has a potency equivalent to not less than 770  $\mu\text{g}$  of carbenicillin ( $\text{C}_{17}\text{H}_{18}\text{N}_2\text{O}_6\text{S}$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

### USP Reference standards (11)—

USP Carbenicillin Monosodium Monohydrate RS

USP Endotoxin RS

**Identification**—It responds to the tests for *Sodium* (191).

**pH** (791): between 6.5 and 8.0, in a solution containing 10 mg of carbenicillin per mL.

**Water, Method I** (921): not more than 6.0%.

**Other requirements**—Where the label states that Carbenicillin Disodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Carbenicillin for Injection*. Where the label states that Carbenicillin Disodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Carbenicillin for Injection*.

### Assay—

**Assay preparation**—Dissolve a suitable quantity of Carbenicillin Disodium, accurately weighed, in *Buffer No. 1*, and dilute quantitatively with *Buffer No. 1* to obtain a solution having a convenient concentration of carbenicillin.

**Procedure**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of *Assay preparation* diluted quantitatively with *Buffer No. 1* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Carbenicillin for Injection

» Carbenicillin for Injection contains an amount of Carbenicillin Disodium equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of carbenicillin ( $\text{C}_{17}\text{H}_{18}\text{N}_2\text{O}_6\text{S}$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

### USP Reference standards (11)—

USP Carbenicillin Monosodium Monohydrate RS

USP Endotoxin RS

**Identification**—It responds to the tests for *Sodium* (191).

**Bacterial endotoxins** (85)—It contains not more than 0.05 USP Endotoxin Unit per mg of carbenicillin.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, 6 g being aseptically dissolved in 200 mL of *Fluid A*.

**pH** (791): between 6.5 and 8.0, in the solution constituted as directed in the labeling.

**Water, Method I** (921): not more than 6.0%.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements for *Uniformity of Dosage Units* (905) and *Constituted Solutions and Labeling* under *Injections* (1).

### Assay—

**Assay preparation 1** (where it is packaged for dispensing and where the package is represented as being a single-dose container)—Constitute Carbenicillin for Injection as directed in the labeling. Withdraw all of the withdrawable contents, and dilute quantitatively with *Buffer No. 1* to obtain a solution having a convenient concentration of carbenicillin.

**Assay preparation 2** (where the label states the quantity of carbenicillin in a given volume of constituted solution)—Constitute Carbenicillin for Injection as directed in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with *Buffer No. 1* to obtain a solution having a convenient concentration of carbenicillin.

**Procedure**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of *Assay preparation* diluted quantitatively with *Buffer No. 1* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Carbenicillin Indanyl Sodium

$C_{26}H_{25}N_2NaO_6S$  516.54

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 6-[[3-[(2,3-dihydro-1*H*-inden-5-yl)oxy]-1,3-dioxo-2-phenylpropyl]amino]-3,3-dimethyl-7-oxo-, monosodium salt, [2*S*-(2 $\alpha$ ,5 $\alpha$ ,6 $\beta$ )]-

1-(5-Indanyl)(2*S*,5*R*,6*R*)-*N*-(2-carboxy-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]hept-6-yl)-2-phenylmalonamate monosodium salt [26605-69-6].

» Carbenicillin Indanyl Sodium has a potency equivalent to not less than 630  $\mu$ g and not more than 769  $\mu$ g of carbenicillin ( $C_{17}H_{18}N_2O_6S$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers. For periods up to 18 months, store at controlled room temperature.

**USP Reference standards** (11)—  
USP Carbenicillin Indanyl Sodium RS

### Identification—

**A:** *Infrared Absorption* (197K).

**B:** It responds to the tests for *Sodium* (191).

**pH** (791): between 5.0 and 8.0, in a solution containing 100 mg per mL.

**Water, Method I** (921): not more than 2.0%.

### Assay—

**Mobile phase**—Prepare a buffer of 0.0009 M tetrabutylammonium hydrogen phosphate and 0.05 M dibasic sodium phosphate as follows. Dissolve 604 mg of tetrabutylammonium phosphate and 26.8 g of dibasic sodium phosphate in 1800 mL of water, adjust with phosphoric acid to a pH of 3.8, and dilute with water to 2000 mL. Prepare a filtered and degassed mixture of this buffer and acetonitrile (116:84), allow to stand for 1 hour, and if necessary readjust with phosphoric acid to a pH of 3.8. Make any necessary adjustments (see *System Suitability* under *Chromatography* (621)).

**Diluting solvent**—Prepare a mixture of acetonitrile and 0.005 M monobasic potassium phosphate (85:15).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Carbenicillin Indanyl Sodium RS quantitatively in *Diluting solvent* to obtain a solution having a known concentration of about 250  $\mu$ g per mL. This *Standard preparation* contains the equivalent of about 222  $\mu$ g of carbenicillin ( $C_{17}H_{18}N_2O_6S$ ) per mL.

**Assay preparation**—Transfer about 125 mg of Carbenicillin Indanyl Sodium, accurately weighed, to a 50-mL volumetric flask, dissolve in *Diluting solvent* with the aid of sonication, dilute with *Diluting solvent* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluting solvent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the responses for the major peaks. Calculate the quantity, in  $\mu$ g, of carbenicillin ( $C_{17}H_{18}N_2O_6S$ ) in each

mg of the Carbenicillin Indanyl Sodium taken by the formula:

$$0.5(CP/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Carbenicillin Indanyl Sodium RS, calculated on the anhydrous basis, in the *Standard preparation*; P is the assigned potency, in  $\mu$ g per mg, of USP Carbenicillin Indanyl Sodium RS; W is the quantity, in mg, of Carbenicillin Indanyl Sodium taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the carbenicillin indanyl peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Carbenicillin Indanyl Sodium Tablets

» Carbenicillin Indanyl Sodium Tablets contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of carbenicillin ( $C_{17}H_{18}N_2O_6S$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—  
USP Carbenicillin Indanyl Sodium RS

**Identification**—Triturate a quantity of finely powdered Tablets, equivalent to about 100 mg of carbenicillin, with 10 mL of a solvent mixture consisting of acetone, ethyl acetate, water, pyridine, and glacial acetic acid (200:100:75:25:1.5). Shake the mixture for 5 minutes, and dilute 1 volume of it with 9 volumes of the solvent mixture. Apply 10  $\mu$ L each of this solution and of a solution of USP Carbenicillin Indanyl Sodium RS in the same solvent mixture containing 1 mg of carbenicillin per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of acetone, ethyl acetate, water, pyridine, and glacial acetic acid (400:300:75:25:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and heat the plate at 80° for 30 minutes. Allow the plate to cool, and expose it to iodine vapors in a closed chamber for about 30 seconds. Spray the plate with a reagent consisting of a 1 in 100 solution of ferric chloride in 0.1 N hydrochloric acid, potassium ferricyanide solution (1 in 100), and methanol (4:4:3): the principal spots from the test solution and the Standard solution are blue on a yellow-green background, and the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution ( $R_f$  about 0.5).

### Dissolution (711)—

**Medium:** water; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of carbenicillin ( $C_{17}H_{18}N_2O_6S$ ) equivalent dissolved from the difference between UV absorbances at the wavelengths of maximum and minimum absorbance at about 267 nm and 254 nm, respectively, of filtered portions of the solution under test, suitably diluted with water, in comparison with a Standard solution having a known concentration of USP Carbenicillin Indanyl Sodium RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{17}H_{18}N_2O_6S$  equivalent is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 2.0%.

#### Assay—

**Mobile phase, Diluting solvent, Standard preparation, and Chromatographic system**—Proceed as directed in the Assay under Carbenicillin Indanyl Sodium.

**Assay preparation**—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 111 mg of carbenicillin ( $C_{17}H_{18}N_2O_6S$ ), to a 50-mL volumetric flask, dissolve in *Diluting solvent* with the aid of sonication, dilute with *Diluting solvent* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluting solvent* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the Assay under Carbenicillin Indanyl Sodium. Calculate the quantity, in mg, of carbenicillin ( $C_{17}H_{18}N_2O_6S$ ) in the portion of Tablets taken by the formula:

$$0.5CP(r_U / r_S)$$

in which the terms are as defined therein.

## Carbidopa

$C_{10}H_{14}N_2O_4 \cdot H_2O$  244.24

$C_{10}H_{14}N_2O_4$  226.23

Benzenepropanoic acid,  $\alpha$ -hydrazino-3,4-dihydroxy- $\alpha$ -methyl-, monohydrate, (S)-;  
(-)-L- $\alpha$ -Hydrazino-3,4-dihydroxy- $\alpha$ -methylhydrocinnamic acid monohydrate [38821-49-7].  
Anhydrous [28860-95-9].

#### DEFINITION

Carbidopa contains NLT 98.0% and NMT 102.0% of carbidopa ( $C_{10}H_{14}N_2O_4 \cdot H_2O$ ).

#### IDENTIFICATION

- A. INFRARED ABSORPTION** (197M)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

#### ASSAY

##### PROCEDURE

**Mobile phase:** Alcohol and 0.05 M monobasic sodium phosphate, adjusted with phosphoric acid to a pH of 2.7 (5:95)

**System suitability solution:** 0.1 mg/mL of USP Carbidopa RS and 0.1 mg/mL of USP Methyldopa RS in *Mobile phase*

**Standard solution:** 0.5 mg/mL of USP Carbidopa RS in *Mobile phase*. [NOTE—Use gentle heat and ultrasonication, if necessary, to dissolve.]

**Sample solution:** 0.5 mg/mL of Carbidopa in *Mobile phase*

##### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 3.9-mm  $\times$  30-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20  $\mu$ L

##### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for methyldopa and carbidopa are about 0.8 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 0.9 between methyldopa and carbidopa, *System suitability solution*

**Relative standard deviation:** NMT 1.5%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of carbidopa ( $C_{10}H_{14}N_2O_4 \cdot H_2O$ ) in the portion of Carbidopa taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Carbidopa RS, as the monohydrate, in the *Standard solution* (mg/mL)

$C_U$  = concentration of Carbidopa in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0%

#### IMPURITIES

- RESIDUE ON IGNITION** (281): NMT 0.1%
- HEAVY METALS, Method II** (231): NMT 10 ppm
- LIMIT OF METHYLDOPA AND CARBIDOPA RELATED COMPOUND A**

**Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the Assay.

**Impurity standard solution:** 2.5  $\mu$ g/mL of USP Methyldopa RS and 2.5  $\mu$ g/mL of USP Carbidopa RS in *Mobile phase*

#### Analysis

**Samples:** *Sample solution* and *Impurity standard solution*  
[NOTE—The relative retention times for methyldopa, carbidopa, and carbidopa related compound A are about 0.8, 1.0, and 1.8 respectively.]

Calculate the percentage of methyldopa in the portion of Carbidopa taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response of methyldopa from the *Sample solution*

$r_S$  = peak response of methyldopa from the *Impurity standard solution*

$C_S$  = concentration of USP Methyldopa RS in the *Impurity standard solution* ( $\mu$ g/mL)

$C_U$  = concentration of the *Sample solution* ( $\mu$ g/mL)

Calculate the percentage of carbidopa related compound A in the portion of Carbidopa taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response of carbidopa related compound A from the *Sample solution*

$r_S$  = peak response of carbidopa from the *Impurity standard solution*

$C_S$  = concentration of USP Carbidopa RS in the *Impurity standard solution* ( $\mu$ g/mL)

$C_U$  = concentration of the *Sample solution* ( $\mu$ g/mL)

**Acceptance criteria:** NMT 0.5% of methyldopa, and NMT 0.5% of carbidopa related compound A

#### SPECIFIC TESTS

- OPTICAL ROTATION, Specific Rotation** (781S)

**Sample solution:** 10 mg/mL, in 0.7 g/mL of aluminum chloride solution (prepared using the hexahydrate form of the aluminum salt) that has been filtered and adjusted with 0.25 N sodium hydroxide to a pH of 1.5

**Acceptance criteria:**  $-21.0^\circ$  to  $-23.5^\circ$ , calculated as the monohydrate

• **Loss on Drying** (731)

**Analysis:** Heat 1 g in a suitable vacuum drying apparatus at 100° and a pressure of NMT 5 mm of mercury to constant weight. Cool, and weigh.

**Acceptance criteria:** 6.9%–7.9%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
USP Carbidopa RS  
USP Methyldopa RS

## Carbidopa and Levodopa Tablets

» Carbidopa and Levodopa Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of carbidopa ( $C_{10}H_{14}N_2O_4$ ) and of levodopa ( $C_9H_{11}NO_4$ ).

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Carbidopa RS

USP Levodopa RS

**Identification**—Transfer a portion of powdered Tablets, equivalent to about 10 mg of carbidopa, to a 100-mL volumetric flask containing about 50 mL of 0.05 N hydrochloric acid. Agitate for 20 minutes, add methanol to volume, mix, and filter or centrifuge. Separately prepare 2 Standard solutions containing 0.1 mg per mL of USP Carbidopa RS and USP Levodopa RS, respectively, in a solvent prepared by mixing equal volumes of 0.05 N hydrochloric acid and methanol. Apply 20  $\mu$ L of the test solution and 20  $\mu$ L of each Standard solution at separate points to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Develop the chromatogram using a solvent system consisting of a mixture of acetone, chloroform, *n*-butanol, glacial acetic acid, and water (60:40:40:40:35) until the solvent front has moved about 15 cm. Air-dry, spray uniformly with about 0.5 mL of ninhydrin reagent (prepared by dissolving 0.3 g of ninhydrin in 100 mL of *n*-butanol acidified with 3 mL of glacial acetic acid), and heat at 105° for about 10 minutes: the solution under test exhibits two spots (red-dish brown for levodopa and yellow-orange for carbidopa) having  $R_f$  values that correspond to those exhibited by the Standard solutions.

**Dissolution** (711)—

**Medium:** 0.1 N hydrochloric acid; 750 mL.

**Apparatus 1:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amounts of carbidopa and levodopa in solution in filtered portions of the solution under test, in comparison with a Standard solution having known concentrations of USP Carbidopa RS and USP Levodopa RS in the same medium, as directed for *Procedure* in the Assay.

**Tolerances**—Not less than 80% (Q) of the labeled amounts of carbidopa ( $C_{10}H_{14}N_2O_4$ ) and levodopa ( $C_9H_{11}NO_4$ ) is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Sodium 1-decanesulfonate solution**—Dissolve 0.24 g of sodium 1-decanesulfonate in 1 L of water.

**Mobile phase**—Mix 11.04 g of monobasic sodium phosphate and 950 mL of water in a beaker. Add 1.3 mL of *Sodium 1-decanesulfonate solution*, and adjust with phosphoric acid to a pH of 2.8. Transfer to a 1-L volumetric flask, dilute with water to volume, and pass through a membrane filter.

**Standard preparation**—Transfer about 50 mg of USP Levodopa RS, accurately weighed, to a 100-mL volumetric flask. Add an accurately weighed quantity of USP Carbidopa RS, which is in a ratio with USP Levodopa RS that corresponds with the ratio of carbidopa to levodopa in the Tablets. Add 10 mL of 0.1 N phosphoric acid. Warm gently to dissolve the standards. Dilute with water to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of levodopa, to a 100-mL volumetric flask, add 10 mL of 0.1 N phosphoric acid, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate, about 2 mL per minute, is adjusted until the retention times for levodopa and carbidopa are about 4 minutes and 11 minutes, respectively. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%; and the resolution factor between levodopa and carbidopa is not less than 6.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of carbidopa ( $C_{10}H_{14}N_2O_4$ ) in the portion of Tablets taken by the formula:

$$(100C)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Carbidopa RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the responses of the carbidopa peak obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of levodopa ( $C_9H_{11}NO_4$ ) by the same formula, reading the terms to refer to levodopa instead of carbidopa.

## Carbinoxamine Maleate

$C_{16}H_{19}ClN_2O \cdot C_4H_4O_4$  406.86

Ethanamine, 2-[(4-chlorophenyl)-2-pyridinylmethoxy]-*N,N*-dimethyl-, (*Z*)-2-butenedioate (1:1).

2-[*p*-Chloro- $\alpha$ -[2-(dimethylamino)ethoxy]benzyl]pyridine maleate (1:1) [3505-38-2].

» Carbinoxamine Maleate, dried at 105° for 2 hours, contains not less than 98.0 percent and not more than 102.0 percent of  $C_{16}H_{19}ClN_2O \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Carbinoxamine Maleate RS

**Identification**—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 50 µg per mL.

*Medium:* methanol.

Absorptivities at 260 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Melting range** (741): between 116° and 121°, determined after drying.

**pH** (791): between 4.6 and 5.1, in a solution (1 in 100).

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Ordinary impurities** (466)—

*Test solution:* chloroform.

*Standard solution:* chloroform.

*Eluant:* a mixture of cyclohexane, chloroform, and diethylamine (75:15:10).

*Visualization:* 1.

**Assay**—Dissolve about 400 mg of Carbinoxamine Maleate, previously dried and accurately weighed, in 50 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 20.34 mg of  $C_{16}H_{19}ClN_2O \cdot C_4H_4O_4$ .

## Carbinoxamine Maleate Tablets

» Carbinoxamine Maleate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_{16}H_{19}ClN_2O \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Carbinoxamine Maleate RS

**Identification**—A solution of carbinoxamine maleate (1 in 50,000) in dilute sulfuric acid (1 in 70) prepared from the Tablets as directed under *Salts of Organic Nitrogenous Bases* (501) exhibits an absorbance maximum at  $263 \pm 2$  nm. The absorptivity at 263 nm is within 7.0% of that of a 1 in 50,000 solution of USP Carbinoxamine Maleate RS in dilute sulfuric acid (1 in 70), similarly measured.

**Dissolution** (711)—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

**Procedure**—Determine the amount of  $C_{16}H_{19}ClN_2O \cdot C_4H_4O_4$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 260 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Carbinoxamine Maleate RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{16}H_{19}ClN_2O \cdot C_4H_4O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Place 1 Tablet in a 100-mL volumetric flask, add 10.0 mL of water, and shake by mechanical means for 15 minutes. Dilute with methanol

to volume, and filter, discarding the first 20 mL of the filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with a mixture of methanol and water (9:1) to obtain a solution containing about 40 µg of carbinoxamine maleate per mL. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Carbinoxamine Maleate RS, in the same medium having a known concentration of about 40 µg per mL, in 1-cm cells, at the wavelength of maximum absorbance at about 260 nm, with a suitable spectrophotometer, using a mixture of methanol and water (9:1) as the blank. Calculate the quantity, in mg, of  $C_{16}H_{19}ClN_2O \cdot C_4H_4O_4$  in the Tablet taken by the formula:

$$(TC / D)(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of carbinoxamine maleate in the Tablet; *C* is the concentration, in µg per mL, of USP Carbinoxamine Maleate RS in the Standard solution; *D* is the concentration, in µg per mL, of carbinoxamine maleate in the solution from the Tablet, based upon the labeled quantity per Tablet and the extent of dilution; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solution from the Tablet and the Standard solution, respectively.

**Assay**—Weigh and finely powder not less than 30 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of carbinoxamine maleate, to a separator, add 35 mL of water and 3 g of sodium bicarbonate, and mix. Extract with five 20-mL portions of chloroform, filtering the extracts through a pledget of cotton. Evaporate the combined chloroform extracts on a steam bath just to dryness, dissolve the residue in 50 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with 0.05 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.05 N perchloric acid is equivalent to 10.17 mg of  $C_{16}H_{19}ClN_2O \cdot C_4H_4O_4$ .

## Carbol-Fuchsin Topical Solution

» Prepare Carbol-Fuchsin Topical Solution as follows:

Basic Fuchsin . . . . .	3 g
Phenol . . . . .	45 g
Resorcinol . . . . .	100 g
Acetone . . . . .	50 mL
Alcohol . . . . .	100 mL
Purified Water, a sufficient quantity, to make . . . . .	1000 mL

Dissolve the Basic Fuchsin in a mixture of the Acetone and Alcohol, and add to this solution the Phenol and Resorcinol previously dissolved in 725 mL of Purified Water. Then add sufficient Purified Water to make the product measure 1000 mL, and mix.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Specific gravity** (841): not less than 0.990 and not more than 1.050.

**Alcohol content** (611): between 7.0% and 10.0% of  $C_2H_5OH$ .

## Carbon Dioxide

CO<sub>2</sub> 44.01  
Carbon dioxide [124-38-9].

### DEFINITION

Carbon Dioxide contains NLT 99.0%, by volume, of carbon dioxide (CO<sub>2</sub>).

[NOTE—The following tests are designed to reflect the quality of Carbon Dioxide in both its vapor and liquid phases, which are present in previously unopened cylinders. Reduce the container pressure by means of a regulator. Withdraw the specimens for the tests with the least possible release of Carbon Dioxide consistent with proper purging of the sampling apparatus. Measure the gases with a gas volume meter downstream from the detector tubes to minimize contamination or change of the specimens.]

### IDENTIFICATION

- A.**  
**Sample:** 100 ± 5 mL, released from the vapor phase of the contents of the container  
**Analysis:** Pass the *Sample* through a carbon dioxide detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.  
**Acceptance criteria:** The indicator change extends throughout the entire indicating range of the tube.

### ASSAY

#### PROCEDURE

[NOTE—Sampling for this Assay may be done from the vapor phase for convenience, but this method results in more residual volume. If the specification of 1 mL is exceeded from the vapor phase, a liquid specimen may be taken.]

**Sample:** 100.0 mL of specimen taken from the liquid phase, as directed in the test for *Nitrogen Dioxide*

**Analysis:** Assemble a 100-mL gas buret, provided with a leveling bulb and two-way stopcock, and a gas absorption pipet of suitable capacity by connecting the pipet to one of the buret outlets. Fill the buret with slightly acidified water (turned pink with methyl orange), and fill the pipet with potassium hydroxide solution (1 in 2). By manipulation of the leveling bulb and leveling water, draw the potassium hydroxide solution to fill the pipet and capillary connection up to the stopcock. Fill the buret with the leveling water, and draw it through the other stopcock opening in such a manner that all gas bubbles are eliminated from the system. Draw the *Sample* into the buret. By raising the leveling bottle, force the measured specimen into the pipet. The absorption may be facilitated by rocking the pipet or by flowing the specimen between pipet and buret. Draw any residual gas into the buret, and measure its volume.

**Acceptance criteria:** NMT 1.0 mL of gas remains (NLT 99.0%, by volume, of CO<sub>2</sub>).

### IMPURITIES

#### NITROGEN DIOXIDE

**Sample:** 550 ± 50 mL, obtained as directed in the *Analysis*

**Analysis:** Arrange the container so that when its valve is opened, a portion of the liquid phase of the contents is released through a piece of tubing of sufficient length to allow all of the liquid to vaporize during passage through it, and to prevent frost from reaching the inlet of the detector tube. Release into the tubing a flow of liquid sufficient to provide 550 mL of the vaporized specimen plus any excess necessary to ensure adequate flushing of air from the system. Pass 550 ± 50 mL of this gas through a nitric oxide–nitrogen dioxide detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.

**Acceptance criteria:** NMT 2.5 ppm

#### LIMIT OF AMMONIA

**Sample:** 1050 ± 50 mL of the gas obtained as directed in the test for *Nitrogen Dioxide*

**Analysis:** Proceed with Carbon Dioxide as directed in the test for *Nitrogen Dioxide*, except pass 1050 ± 50 mL of this gas through an ammonia detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.

**Acceptance criteria:** NMT 0.0025%

#### LIMIT OF HYDROGEN SULFIDE

**Sample:** 1050 ± 50 mL, released from the vapor phase

**Analysis:** Pass 1050 ± 50 mL, released from the vapor phase, through a hydrogen sulfide detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.

**Acceptance criteria:** NMT 1 ppm

#### LIMIT OF NITRIC OXIDE

**Sample:** 550 ± 50 mL, released from the vapor phase

**Analysis:** Pass 550 ± 50 mL, released from the vapor phase, through a nitric oxide–nitrogen dioxide detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.

**Acceptance criteria:** NMT 2.5 ppm

#### CARBON MONOXIDE

**Sample:** 1050 ± 50 mL, released from the vapor phase of the contents of the container

**Analysis:** Pass 1050 ± 50 mL, released from the vapor phase of the contents of the container, through a carbon monoxide detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.

**Acceptance criteria:** NMT 0.001%

#### SULFUR DIOXIDE

**Sample:** 1050 ± 50 mL, obtained as directed in the test for *Nitrogen Dioxide*

**Analysis:** Proceed with Carbon Dioxide as directed in the test for *Nitrogen Dioxide*, except to pass 1050 ± 50 mL through a sulfur dioxide detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.

**Acceptance criteria:** NMT 5 ppm

### SPECIFIC TESTS

#### WATER DETERMINATION

**Analysis:** Flush the regulator that has been flushed with 5 L or more of the gas specimen. Pass 50 ± 5 L, released from the vapor phase, through a water vapor detector tube connected to the regulator with a minimum length of metal or polyethylene tubing. Measure the gas passing through the detector tube with a gas flowmeter set at a flow rate of 2 L/min.

**Acceptance criteria:** NMT 150 mg/m<sup>3</sup>

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in cylinders.

## Carbon Monoxide C 11

» Carbon Monoxide C 11 is a colorless, odorless, non-irritating gas, suitable for administration by inhalation, in which a portion of the molecules are labeled with radioactive <sup>11</sup>C. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of <sup>11</sup>C expressed in MBq (or in mCi) at the time indicated in the labeling.

**Specific activity:** dependent upon the amount of radioactivity to be inhaled, but not more than 1.23 mmoles of carbon monoxide per volume.

**Packaging and storage**—Dispense the gas either continuously or batchwise, and preserve in a single-dose container that is adequately shielded. It may also be trapped either on activated charcoal at  $-196^{\circ}$  or on a molecular sieve at  $-72^{\circ}$ .

**Labeling**—The label must include the following: the time and date of calibration; the amount of  $^{11}\text{C}$  as carbon monoxide expressed as total MBq (mCi) at time of calibration; the expiration time and date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations correction is to be made for radioactive decay, and states that the radioactive half-life of  $^{11}\text{C}$  is 20.39 minutes. Each container to hold  $^{11}\text{CO}$  shall be independently labeled to indicate lot number and/or batch number. The labeling states that a microbiological filter (0.22  $\mu\text{m}$ ) is to be in place to remove any possible particulate matter that could be carried through to the final product.

**Radionuclide identification** (see *Radioactivity* <821>)—

**A:** Its gamma-ray spectrum is identical to that of a specimen of  $^{11}\text{C}$  in that it exhibits a positron annihilation peak at 0.511 MeV and possibly a sum peak of 1.022 MeV, dependent upon geometry and detector efficiency.

**B:** Radio-gas chromatography using a molecular sieve chromatographic column to determine the absence of  $^{13}\text{N}_2$  using a suitable radioactivity detector and mass detector.

**Radionuclidic purity**—A multichannel analyzer is used to count all radioactivity from 40 to 2,500 KeV to determine the absence of radiation, other than at 0.511 MeV and 1.022 MeV, over a period of 4 hours. Possible impurities could be  $^{13}\text{N}_2$  ( $t_{1/2} = 9.97$  min, this gamma ray spectrum is indistinguishable from  $^{11}\text{C}$ , (B+) 491 KeV),  $^{10}\text{C}$  ( $t_{1/2} = 19$  sec, 718.3 KeV (100%)),  $^{14}\text{O}$  ( $t_{1/2} = 70$  sec, 2312.7 KeV (99.4%)).  $^{11}\text{C}$ CO should contain no more than 10% impurities at the time of inhalation.

**Radiochemical purity and mass determination**—

[NOTE—This pharmaceutical may be synthesized by different methods and may therefore contain different impurities. Additional validated tests relevant to the synthetic procedure may be necessary in order to assure radiochemical purity of the final product.] Confirm by radio-gas chromatography. The gas stream, either directly from the target, or after initial chemical processing, is directed to an injection loop valve of a gas chromatograph and two precalibrated columns, a molecular sieve that allows separation of carbon monoxide from the different air components ( $\text{O}_2$ ,  $\text{N}_2$ , and  $\text{CH}_4$ ), and a column containing support S3 and of sufficient length to separate  $\text{CO}_2$  from  $\text{N}_2$  and  $\text{CO}$  (which co-elute) and  $\text{CO}_2$  from  $\text{NO}_2$  at room temperature. A simple radioactivity detector and a thermal conductivity detector (or equivalent) are required for the mass determination of carbon monoxide. The radiochemical purity is not less than 98%. Mass analysis of the gas-air mixture must demonstrate levels of carbon monoxide less than 1.23 mmoles in the entire dose which is the upper limit for a single-bolus inhalation.

**Assay for radioactivity**—Determine the radioactivity, in MBq (or mCi), by use of a calibrated system as directed under *Radioactivity* <821>.

## Flumazenil C 11 Injection

» Flumazenil C 11 Injection is a sterile solution, suitable for intravenous administration, of Flumazenil in which a portion of the molecules are labeled at the N-position with radioactive  $^{11}\text{C}$ . It contains not less than 90.0 percent and not more than 110 percent of the labeled amount of

$^{11}\text{C}$  expressed in MBq (or mCi) at the time indicated in the labeling. Its specific activity is not less than 14.8 GBq (400 mCi) per  $\mu\text{mol}$ . It may contain suitable buffers.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers that are adequately shielded.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* <1>: the time and date of calibration; the amount of  $^{11}\text{C}$  as [N-methyl- $^{11}\text{C}$ ]Flumazenil, expressed as MBq (or mCi); the specific activity, expressed as MBq (or mCi) per  $\mu\text{mol}$ ; the concentration, expressed as MBq (or mCi) per mL, at the date and time of calibration; the expiration date and time; the lot or batch number; the name and quantity of any added preservative or stabilizer; and the statements, "Caution—Radioactive Material" and "Do not use if cloudy or if it contains particulate matter." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and states that the radioactive half-life of  $^{11}\text{C}$  is 20 minutes.

**USP Reference standards** <11>—

USP Endotoxin RS

USP Flumazenil RS

**Radionuclide identification** <821>—Its gamma-ray spectrum is identical to that of a specimen of  $^{11}\text{C}$  in that it exhibits a positron annihilation peak at 0.511 MeV and possibly a sum peak of 1.022 MeV, dependent upon geometry and detector efficiency.

**Bacterial endotoxins** <85>—It contains not more than 175/V USP Endotoxin Unit per mL, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** <791>: between 4.5 and 8.5.

**Radionuclidic purity** <821>—Using a multichannel analyzer, count all radioactivity from 40 to 2,500 keV to determine the absence of radiation, other than at 0.511 MeV and 1.022 MeV, over a period of 4 hours. Determine the half-life (20 minutes) by a suitable detector system.

**Chemical purity**—

**Mobile phase**—Transfer 1.2 g of monobasic sodium phosphate to a 1000-mL volumetric flask, dissolve in 500 mL of deionized distilled water, and dilute with deionized distilled water to volume to obtain a stock solution. Transfer 300 mL of acetonitrile to another 1000-mL volumetric flask, and dilute with the stock solution to volume. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Dissolve an accurately weighed quantity of USP Flumazenil RS in acetonitrile to obtain a solution having a known concentration of 1 mg of flumazenil per mL. Dilute a portion of this solution quantitatively with *Mobile phase* to obtain a solution having a known concentration of about 10  $\mu\text{g}$  of flumazenil per mL.

**Test solution**—Pipet an accurately measured volume of Injection into a suitable container, and dilute with *Mobile phase* to obtain a solution containing about 0.1 mL of flumazenil per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 2 mL per minute. The column temperature is maintained at  $20^{\circ}$ . Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 100 theoretical plates; the tailing factor is not more than 1.1; and the relative standard deviation for replicate injections is not more than 3.2%.

**Procedure**—Inject about 20  $\mu\text{L}$  of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Separately calculate the percentage of

each impurity in the portion of the Injection taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all the peaks: not more than 0.2% of any individual impurity is found, and not more than 0.9% of total impurities is found.

#### Radiochemical purity <821>—

*Mobile phase and System suitability solution*—Prepare as directed in the test for *Chemical purity*.

*Chromatographic system*—Proceed as directed in the test for *Chemical purity*, except that the liquid chromatograph is also equipped with a suitable collimated radiation detector (see *Radioactivity* <821>).

*Procedure*—Inject about 20  $\mu$ L of the Injection into the chromatograph, record the chromatogram, and measure responses for the major peaks. The radioactivity under the main peak is not less than 98% of the total radioactivity measured.

#### Specific activity—

*Mobile phase and System suitability solution*—Proceed as directed in the test for *Chemical purity*.

*Chromatographic system*—Proceed as directed in the test for *Chemical purity*, except that the liquid chromatograph is also equipped with a suitable collimated radiation detector (see *Radioactivity* <821>).

*Procedure*—Calculate the specific activity, in MBq (or mCi) per  $\mu$ mol, of Injection by the formula:

$$3.03(C_R P_R) / C$$

in which  $C_R$  is the radioactivity content, in MBq (or mCi) per mL, as determined in the *Assay for radioactivity*;  $P_R$  is the radiochemical purity (in %), as determined in the test for *Radiochemical purity*; and  $C$  is the concentration, in  $\mu$ g per mL, of flumazenil in the Injection as determined in the test for *Chemical purity*. The specific activity is not less than 400 mCi per  $\mu$ mol.

**Other requirements**—It meets the requirements under *Injections* <1>, except that the Injection may be distributed or dispensed prior to completion of the test for *Sterility* <71>, the latter test being started on the day following final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity** <821>—Using a suitable counting assembly (see *Selection of a Counting Assembly*), determine the radioactivity, in MBq (or mCi) per mL, of Injection by use of a calibrated system.

## Mespiperone C 11 Injection

» Mespiperone C 11 Injection is a sterile, isotonic solution, suitable for intravenous administration, of 3-*N*-[ $^{11}\text{C}$ ] methylspiperone in which a portion of the molecules are labeled with radioactive  $^{11}\text{C}$ . It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{11}\text{C}$  expressed in GBq (or mCi) at the time

indicated in the labeling. Its specific activity is not less than 18.5 GBq (500 mCi) per  $\mu$ mol.

#### Specific activity—

*Mobile phase and Standard solution*—Prepare as directed in the test for *Chemical purity*.

*Chromatographic system*—Proceed as directed in the test for *Chemical purity*.

*Procedure*—Calculate the specific activity, in MBq (or mCi) per  $\mu$ mol, of Mespiperone C 11 Injection by the formula:

$$3.11(C_R P_R) / C$$

in which  $C_R$  is the radioactivity content, in MBq (or mCi) per mL, as determined in the *Assay for radioactivity*;  $P_R$  is the radiochemical purity (in %), as determined in the test for *Radiochemical purity*, and  $C$  is the concentration (in  $\mu$ g per mL) of 3-methylspiperone in the Injection, as determined in the test for *Chemical purity*.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers that are adequately shielded.

**Labeling**—Label it to include the following: the time and date of calibration; the amount of  $^{11}\text{C}$  as methylspiperone expressed as total GBq (or mCi) at time of calibration; the expiration time and date; the lot or batch number; and the statements, "Caution—Radioactive Material" and "Do not use if cloudy or if it contains particulate matter." The labeling indicates that in making dosage calculations correction is to be made for radioactive decay, and states that the radioactive half-life of  $^{11}\text{C}$  is 20 minutes.

#### USP Reference standards <11>—

USP Endotoxin RS

**Radionuclide identification** (see *Radioactivity* <821>)—Its gamma-ray spectrum is identical to that of a specimen of  $^{11}\text{C}$  in that it exhibits a positron annihilation peak at 0.511 MeV and possibly a sum peak of 1.022 MeV, dependent on geometry and detector efficiency.

**Bacterial endotoxins** <85>—It contains not more than 175/V USP Endotoxin Unit per mL of the Injection, in which  $V$  is the maximum recommended total dose, in mL, at the expiration time.

**pH** <791>: between 4.5 and 7.

**Radionuclidic purity** <821>—Using a multichannel analyzer, count all radioactivity from 40 to 2500 KeV to determine the absence of radiation, other than at 0.511 MeV and 1.022 MeV, over a period of 4 hours. Determine the half-life (20 minutes) by a suitable detector system.

#### Chemical purity—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and 0.05 M monobasic potassium phosphate (70:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard solution*—Dissolve an accurately weighed quantity of 3-methylspiperone hydrochloride in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

*Test solution*—Pipet an accurately measured volume of Injection into a suitable container, and dilute with *Mobile phase* to obtain a solution containing about 0.1 mg per mL.

*Chromatographic system* (see *Chromatography* <621>). The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 0.8 mL per minute. For simultaneous analysis of radiochemical purity, a suitable radioactivity detector (see *Radioactivity* <821>) is coupled to the system. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 100 theoretical plates, the tailing factor for the analyte peak is not

more than 1.1, and the relative standard deviation for replicate injections is not more than 3.2%.

**Procedure**—Inject about 20  $\mu\text{L}$  of the *Test Solution* into the chromatograph, record the chromatogram, and measure the peak responses. Separately calculate the percentage of each impurity in the portion of Injection taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response obtained for each impurity, and  $r_s$  is the sum of the responses of all of the peaks: not more than 0.2% of any individual impurity is found, and the sum of all impurities is not more than 0.9%.

**Radiochemical purity** (821)—Proceed as directed in the test for *Chemical purity*, except that the liquid chromatograph is also equipped with a suitable collimated radioactivity detector. The radioactivity under the main peak is not less than 98% of the total radioactivity measured.

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day following final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity** (821)—Using a suitable counting assembly (see *Selection of a Counting Assembly*), determine the radioactivity, in GBq (or mCi) per mL, of Injection by use of a calibrated system.

## Methionine C 11 Injection

» Methionine C 11 Injection is a sterile isotonic solution, suitable for intravenous administration of  $[\text{C}^{11}]$ methionine, in which a portion of the molecules are labeled with radioactive  $^{11}\text{C}$ . It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{11}\text{C}$  expressed in MBq (or in mCi) at the time indicated in the labeling. It may contain preservatives and stabilizers.

**Specific activity:** not less than 37.0 GBq (1.0 Ci) per mmol.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers that are adequately shielded.

**Labeling**—Label it to include the following: the time and date of calibration; the amount of  $^{11}\text{C}$  as methionine expressed as total MBq (or mCi) per mL at time of calibration; the expiration time and date; the name and quantity of any added preservative or stabilizer; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and states that the radioactive half-life of  $^{11}\text{C}$  is 20.4 minutes. Each container to hold  $^{11}\text{C}$  methionine shall be independently labeled to indicate lot number and batch number. The labeling states that a microbiological filter (0.22  $\mu\text{m}$ ) is to be in place to remove any possible particulate matter that could be carried through to the final product.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of  $^{11}\text{C}$  in that it exhibits a positron annihilation peak at 0.511 MeV and possibly a sum peak of 1.022 MeV, dependent upon geometry and detector efficiency.

**Bacterial endotoxins** (85)—It contains not more than 175/V USP Endotoxin Unit per mL of the Injection, in which V is the maximum recommended total dose, in mL, at the expiration time.

**pH** (791): between 6.0 and 8.0.

**Radionuclidic purity** (821)—Using a suitable gamma-ray spectrometer, determine the absence of radiation other than at 0.511 MeV, over a period of 20 minutes. Determine the half-life (20.41 minutes) by a suitable detector system.

**Chemical purity**—

**Mobile phase**—Prepare a filtered and degassed mixture of 0.008 M copper acetate and 0.017 M L-proline. Adjust with 0.030 M sodium acetate to a pH of 5. Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve an accurately weighed quantity of DL-methionine in *Mobile phase* and dilute quantitatively, and stepwise if necessary, to obtain a solution containing 0.1 mg per mL.

**Test solution**—Pipet a volume of Injection into a suitable container, and dilute with *Mobile phase* to obtain a solution containing about 0.1 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 0.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are 1.0 for D-methionine and 2.4 for L-methionine; the resolution,  $R$ , between the D- and L-enantiomers is not less than 1.5; the column efficiency is not less than 1400 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Inject a volume (about 10  $\mu\text{L}$ ) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of D-methionine in the portion of Injection taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for D-methionine, and  $r_s$  is the sum of the responses of all of the peaks: not more than 4% of D-enantiomer is found.

**Radiochemical purity**—Proceed as directed under *Chemical purity*. The radioactivity of the main peak is not less than 98% of the total radioactivity measured.

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to completion of the tests for *Sterility* (71) and *Bacterial Endotoxins* (85), these tests being started on the day of final manufacture, and except that it is not subject to the recommendation of *Container Content*.

**Assay for radioactivity** (821)—Using a suitable counting assembly (see *Selection of a Counting Assembly*), determine the radioactivity, in GBq (Ci) per mL, of the Injection by use of a calibrated system.

## Raclopride C 11 Injection

» Raclopride C 11 Injection is a sterile solution, suitable for intravenous administration, of

raclopride, in which a portion of the molecules are labeled at the O-methyl position with radioactive  $^{11}\text{C}$ . It contains not less than 90.0 percent and not more than 110 percent of the labeled amount of  $^{11}\text{C}$  expressed in MBq (or mCi) at the time indicated in the labeling. Its specific activity is not less than 18.5 Gbq (500 mCi) per  $\mu\text{mol}$ . It may contain suitable buffers.

#### Specific activity—

*Mobile phase and Standard solution*—Prepare as directed in the test for *Chemical purity*.

*Chromatographic system*—Proceed as directed in the test for *Radiochemical purity*.

*Procedure*—Calculate the specific activity, in GBq (or mCi) per  $\mu\text{mol}$ , of Injection by the formula:

$$3.47(C_r P_r) / C$$

in which  $C_r$  is the radioactivity content, in MBq (or mCi) per mL, as determined in the *Assay for radioactivity*;  $P_r$  is the radiochemical purity (in %), as determined in the test for *Radiochemical purity*; and  $C$  is the concentration (in  $\mu\text{g}$  per mL) of raclopride in the Injection, as determined in the test for *Chemical purity*.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers that are adequately shielded.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling under Injections* (1): the time and date of calibration; the amount of  $^{11}\text{C}$  as [O-methyl- $^{11}\text{C}$ ]raclopride, expressed as total megabecquerels (or millicuries); the specific activity, expressed as megabecquerels (or millicuries) per  $\mu\text{mol}$ ; and the concentration, expressed as megabecquerels (or millicuries) per mL, at the date and time of calibration; the expiration date and time; the lot or batch number; the name and quantity of any added preservative or stabilizer; and the statements, "Caution—Radioactive Material" and "Do not use if cloudy or if it contains particulate matter." The labeling indicates that in making dosage calculations correction is to be made for radioactive decay, and states that the radioactive half-life of  $^{11}\text{C}$  is 20 minutes.

#### USP Reference standards (11)—

USP Endotoxin RS

**Radionuclide identification** (821)—Its gamma-ray spectrum is identical to that of a specimen of  $^{11}\text{C}$  in that it exhibits a positron annihilation peak at 0.511 MeV and possibly a sum peak of 1.022 MeV, dependent upon geometry and detector efficiency.

**Bacterial endotoxins** (85)—It contains not more than 175/V USP Endotoxin Unit per mL, in which  $V$  is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 4.5 and 7.

**Radionuclidic purity** (821)—Using a multichannel analyzer, count all radioactivity from 40 to 2500 keV to determine the absence of radiation, other than at 0.511 MeV and 1.022 MeV, over a period of 4 hours. Determine the half-life (20 minutes) by a suitable detector system.

#### Chemical purity—

*Mobile phase*—Add 840  $\mu\text{L}$  of phosphoric acid to 500 mL of deionized distilled water in a 1000-mL volumetric flask. Add 270 mL of acetonitrile, dilute with deionized distilled water to volume, filter, and degas. Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

*Standard solution*—Dissolve an accurately weighed quantity of raclopride (as the tartrate salt) in water to obtain a solution having a known concentration of about 1 mg of raclopride per mL. Dilute a portion of this solution quantita-

tively with *Mobile phase* to obtain a solution having a known concentration of about 10  $\mu\text{g}$  of raclopride per mL.

*Test solution*—Prepare a solution by quantitatively diluting an accurately measured volume of Injection, equivalent to about 37 MBq (1 mCi) of radioactivity, with 10 parts of *Mobile phase*, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L9. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.75 for O-desmethyleraclopride and 1.0 for raclopride; the resolution,  $R$ , between acetate and carbonate is not less than 1.5; the column efficiency determined from the analyte peak is not less than 85 theoretical plates; and the relative standard deviation for replicate injections is not more than 10.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the responses for the raclopride peaks. Calculate the concentration, in  $\mu\text{g}$  per mL, of raclopride ( $\text{C}_{15}\text{H}_{20}\text{Cl}_2\text{N}_2\text{O}_3$ ) in the portion of Injection taken by the formula:

$$C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of raclopride in the *Standard solution*; and  $r_U$  and  $r_S$  are the raclopride peak responses obtained from the *Test solution* and the *Standard solution*, respectively. In the chromatogram of the *Test solution*, the area of the peak with a retention time of about 6 minutes (raclopride) is not less than 98% of the total area of all peaks.

#### Radiochemical purity—

*Mobile phase and Standard solution*—Prepare as directed in the test for *Chemical purity*.

*Chromatographic system*—Proceed as directed in the test for *Chemical purity*, except that the liquid chromatograph is also equipped with a suitable collimated radiation detector (see *Radioactivity* (821)).

*Procedure*—Inject about 20  $\mu\text{L}$  of the Injection into the chromatograph, record the chromatogram, and measure the areas of the responses for the major peaks. The radioactivity under the main peak is not less than 95% of the total area of all peaks observed, and its retention time is within 10% of that obtained for the *Standard solution*, similarly chromatographed.

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day following final manufacture, and except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity** (821)—Using a suitable counting assembly (see *Selection of a Counting Assembly under Radioactivity* (821)), determine the radioactivity, in MBq (or mCi) per mL, of Injection by use of a calibrated system.

## Sodium Acetate C 11 Injection

» Sodium Acetate C 11 Injection is a sterile solution, suitable for intravenous administration, of Sodium Acetate in which a portion of the carboxyl molecules are labeled with radioactive  $^{11}\text{C}$ . It contains not less than 90.0 percent and not

more than 110.0 percent of the labeled amount of  $^{11}\text{C}$  expressed in MBq (or in  $\mu\text{Ci}$  or mCi) at the time indicated in the labeling. It may contain suitable buffers.

**Specific activity:** not less than 3.7 GBq (100 mCi) per  $\mu\text{mol}$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers that are adequately shielded.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{11}\text{C}$  as labeled sodium acetate expressed as total MBq (or mCi) and the concentration as megabecquerels per mL (or as millicuries per mL), on the date and time of calibration; the expiration date and time; the lot or batch number; the name and quantity of any added preservative or stabilizer; an indication on the labeling that states, "Do not use if cloudy or if it contains particulate matter;" and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{11}\text{C}$  is 20 minutes.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Radionuclide identification** (821)—Its gamma-ray spectrum is identical to that of a specimen of  $^{11}\text{C}$  in that it exhibits a positron annihilation peak at 0.511 MeV and possibly a sum peak of 1.022 MeV, dependent upon geometry and detector efficiency.

**Bacterial endotoxins** (85)—It contains not more than 175/V USP Endotoxin Unit per mL, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 4.5 and 8.5.

**Radionuclidic purity** (821)—A multichannel analyzer is used to count all radioactivity from 40 to 2,500 keV to determine the absence of radiation, other than at 0.511 MeV and 1.022 MeV, over a period of 4 hours. Determine the half-life by a suitable detector system.

**Chemical purity**—

**Mobile phase**—Add 14 mL of 0.5 N sulfuric acid to 500 mL of water in a 1000-mL volumetric flask. Add 100 mL of acetonitrile, dilute with water to volume, and mix. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Reference solution**—Dissolve an accurately weighed quantity of sodium acetate in water to obtain a solution having a known concentration of about 1 mg per mL. Quantitatively dilute a portion of this solution with *Mobile phase* to obtain a solution having a known concentration of about 20  $\mu\text{g}$  per mL.

**Test solution**—Prepare a solution by quantitatively diluting an accurately measured volume of Injection, equivalent to about 1 mCi of radioactivity with 10 parts of *Mobile phase*, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 7.8-mm  $\times$  10-cm column that contains packing L9. The flow rate is about 1 mL per minute. Chromatograph the *Reference solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 minutes for acetate and 1.0 minute for carbonate; the resolution,  $R$ , between acetate and carbonate is not less than 1.4; the column efficiency is not less than 85 theoretical plates; and the relative standard deviation for replicate injections is not more than 10%.

**Procedure**—Separately inject equal volumes (about 50  $\mu\text{L}$ ) of the *Reference solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the acetate peaks. Calculate the concentration,

in  $\mu\text{g}$  per mL, of sodium acetate in the Injection by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in g per mL, of sodium acetate in the *Reference solution*; and  $r_U$  and  $r_S$  are the acetate peak responses obtained from the *Test solution* and the *Reference solution*, respectively.

**Radiochemical purity**—

**Mobile phase and Reference solution**—Proceed as directed under *Chemical purity*.

**Chromatographic system**—Proceed as directed under *Chemical purity* except that the liquid chromatograph is also equipped with a suitable collimated radiation detector (see *Radioactivity* (821)).

**Procedure**—Inject about 30  $\mu\text{L}$  of the Injection into the chromatograph, record the chromatogram, and measure the areas for the major peaks. The radioactivity under the acetate C 11 peak is not less than 95% of the total area of all peaks observed, and its retention time is within  $\pm 10\%$  of that obtained for the *Reference solution*, similarly chromatographed.

**Other requirements**—It meets the requirements under *Injections* (1), except that the Injection may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day following final manufacture, and except that it is not subject to the recommendation of *Container Content*.

**Assay for radioactivity** (821)—Using a suitable counting assembly (see *Selection of a Counting Assembly*), determine the radioactivity in MBq (mCi) per mL, of the Injection by use of a calibrated system.

## Urea C 13

» Urea C 13 contains not less than 99.0 percent and not more than 100.5 percent of  $^{13}\text{CH}_4\text{N}_2\text{O}$ .

**Packaging and storage**—Preserve in well-closed containers at room temperature.

**USP Reference standards** (11)—  
USP Urea C 13 RS

**Limit of biuret**—

**Standard solution**—Dissolve an accurately weighed quantity of biuret in water, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.033 mg per mL.

**Test solution**—Transfer 100.0 mg of Urea C 13 to a test tube, and dissolve in 3 mL of water.

**Procedure**—To the *Test solution* and to 3 mL of the *Standard solution* add 3 mL of sodium hydroxide solution (10 in 100) and about 3 drops of copper sulfate solution (0.5 in 100), mix, and allow to stand for 5 minutes. Any reddish violet color in the *Test solution* is not more intense than that obtained from the *Standard solution*: not more than 0.1% of biuret is found.

**Isotopic purity**—

**Test solution**—Prepare a solution in methanol containing about 12 mg of Urea C 13 per mL.

**Chromatographic system** (see *Chromatography* (621) and *Mass Spectrometry* (736))—The gas chromatograph is connected to a mass spectrometer, and is equipped with a 0.25-mm  $\times$  15-m capillary column coated with a 0.1- $\mu\text{m}$  film of phase G47. The injection port is maintained at a temperature of 250°, the detector is maintained at a temperature of 200°, and the transfer line to the mass spectrometer is maintained at a temperature of 265°. Helium is

used as the carrier gas. The mass spectrometer is operated in a single-ion response mode. The electron energy is 70 eV.

**Procedure**—Inject about 1 µL of the *Test solution* into the gas chromatograph, record the total ion chromatogram, and combine all of the mass spectra scans across the entire major peak. Record the peak intensities at mass-to-charge ratios of 60, 61, 62, and 63. Calculate the percentage of carbon that is C 13 in the portion of Urea C 13 taken by the formula:

$$100[(I_{61} + I_{63})/(I_{60} + I_{61} + I_{63})]$$

in which  $I_{60}$ ,  $I_{61}$ , and  $I_{63}$  are the relative peak intensities at mass-to-charge ratios of 60, 61, and 63, respectively: not less than 99% is found. Calculate the percentage of oxygen that is O 18 in the portion of Urea C 13 taken by the formula:

$$100[(I_{62} + I_{63})/(I_{60} + I_{61} + I_{62} + I_{63})]$$

in which  $I_{62}$  is the relative peak intensity at a mass-to-charge ratio of 62, and the other terms are as defined above: not more than 15% is found.

**Other requirements**—It meets the requirements for *Identification tests A and B*, *Melting range*, *Residue on ignition*, *Alcohol-insoluble matter*, *Chloride*, *Sulfate*, and *Heavy metals* under *Urea*.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile, methanol, and water (89:10:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Biuret stock solution**—Transfer about 15 mg of biuret, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**System suitability preparation**—Transfer about 25 mg of urea, accurately weighed, to a 10-mL volumetric flask. Pipet 1.0 mL of *Biuret stock solution* into the flask, dilute with *Mobile phase* to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Urea C 13 RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 2 mg per mL.

**Assay preparation**—Transfer about 100 mg of Urea C 13, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 200-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L8. The flow rate is about 0.8 mL per minute. Chromatograph the *System suitability preparation* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between urea and biuret is not less than 1.5; and the relative standard deviation for replicate injections is not more than 1%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of  $^{13}\text{CH}_4\text{N}_2\text{O}$  in the portion of Urea C 13 taken by the formula:

$$(M_U / M_S)50C(r_U / r_S)$$

in which  $M_U$  and  $M_S$  are the molecular weights of Urea C 13 and USP Urea C 13 RS, respectively;  $C$  is the concentration, in mg per mL, of USP Urea C 13 RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Urea C 13 for Oral Solution

» Urea C 13 for Oral Solution is a dry powder prepared from Urea C 13. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of urea C 13 ( $^{13}\text{CH}_4\text{N}_2\text{O}$ ). It contains no preservatives.

**Packaging and storage**—Preserve in sterile, well-closed containers.

**Labeling**—Label it to indicate that the solution is to be discarded if particulate matter is visible after reconstitution. [NOTE—It is to be reconstituted with *Sterile Purified Water*.]

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—The total aerobic microbial count does not exceed 1000 cfu per g, the total combined molds and yeasts count does not exceed 100 cfu per g, and it meets the requirements for the absence of *Salmonella* species and *Escherichia coli*.

**Completeness of solution** (641): meets the requirements, a solution in carbon dioxide-free water containing 100 mg per mL being used.

**Other requirements**—It meets the requirements for *Identification tests A and B* under *Urea* and for the *Assay* under *Urea C 13*, and for packaged solids under *Uniformity of Dosage Units* (905).

## Urea C 14 Capsules

» Urea C 14 Capsules contain  $^{14}\text{CH}_4\text{N}_2\text{O}$  in which a portion of the molecules are labeled with radioactive  $^{14}\text{C}$  to provide 0.04 MBq (or 1 µCi) of radioactivity per capsule. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{14}\text{C}$  expressed as MBq (or µCi).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Expiration date**—The expiration date is not later than two years from the date of manufacture.

**Labeling**—Label it to include the following: the amount of  $^{14}\text{C}$ , expressed in MBq (or µCi) per Capsule at the time of calibration; the expiration date; the total radioactivity per container; and the statement, "Caution—Radioactive material."

**Radionuclide identification** (821)—A solution of 1 or more Capsules in 1 N hydrochloric acid when tested using a liquid scintillation counter produces beta emission having a 49 keV mean and a 156 keV max.

**Dissolution** (711)—

*Medium*: simulated gastric fluid TS; 500 mL.

*Apparatus 1*: 50 rpm.

*Time*: 10 minutes.

**Procedure**—Determine the background levels of  $^{14}\text{C}$  with a 1-mL portion of the solution under test using a liquid scintillation counter.

**Tolerances**: not less than 80% (Q) of the labeled amount of  $^{14}\text{C}$  is dissolved in 10 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Radionuclidic purity** (821)—Determine the radionuclidic purity of a solution of 1 or more Capsules in water using a liquid scintillation counter: not less than 99.9% of the radioactivity is present as C 14.

**Radiochemical purity**—

*Adsorbent*: 0.25-mm layer of chromatographic cellulose.

*Test solution*—Open 2 Capsules and place them in a suitable container, add 8 mL of methanol, and mix.

*Reference solution*: 40 mg of urea per mL, in water.

*Application volume*: 20  $\mu$ L of the *Test solution* and 4  $\mu$ L of the *Reference solution*.

*Developing solvent system*: *n*-butanol saturated with water.

*Procedure*—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Locate the spots on the plate by spraying with Ehrlich's reagent. Determine the radioactivity distribution with a suitable radiation detector (see *Radioactivity* (821)), and obtain the  $R_f$  value: the  $R_f$  value of the principal spot from the *Test solution* corresponds to that obtained from the *Reference solution*, and the radioactivity of the  $^{14}\text{C}$  band is not less than 90% of the total radioactivity.

**Assay for radioactivity** (821)—Prepare a solution of 1 or more Capsules in 1 N hydrochloric acid. Using a liquid scintillation counter, determine the radioactivity, in MBq (or mCi) per mL by use of a calibrated system.

## Carboplatin

$\text{C}_6\text{H}_{12}\text{N}_2\text{O}_4\text{Pt}$  371.25

Platinum, diammine[1,1-cyclobutanedicarboxylato(2-)- $\text{O},\text{O}'$ ]-, (SP-4-2).

*cis*-Diammine(1,1-cyclobutanedicarboxylato)platinum [41575-94-4].

» Carboplatin contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_6\text{H}_{12}\text{N}_2\text{O}_4\text{Pt}$ , calculated on the anhydrous basis.

**Caution**: Great care should be taken in handling Carboplatin because it is a suspected carcinogen.

**Packaging and storage**—Preserve in tight containers, protected from light.

**USP Reference standards** (11)—

USP Carboplatin RS

**Identification**, *Infrared Absorption* (197K).

**Crystallinity** (695): meets the requirements.

**pH** (791): between 5.0 and 7.0, in a solution in water containing 10 mg per mL.

**Water**, *Method I* (921): not more than 0.5%, anhydrous formamide being used as the solvent.

**Transmittance**—Transfer about 100 mg of Carboplatin, accurately weighed, to a 10-mL volumetric flask, dissolve in 6 mL of water, dilute with water to volume, and mix. Determine the percent transmittance in 1-cm cells at a wavelength of 440 nm, using water as the blank: not less than 97% transmittance is observed.

**Water-insoluble matter**—Transfer about 1 g of carboplatin, accurately weighed, to a 150-mL beaker. Add 100 mL of water, and dissolve by stirring with a stirring bar for 30 minutes. With aid of suction, filter through a tared filtering cru-

cible. Rinse the beaker with water, and transfer the rinsings to the crucible. Dry the crucible at  $130 \pm 10^\circ$  to constant weight: not more than 0.5% is found.

**Limit of 1,1-cyclobutanedicarboxylic acid**—

*Reagent A*—Dissolve 8.5 g of tetrabutylammonium hydrogen sulfate in 80 mL of water. Add 3.4 mL of phosphoric acid, and adjust with 10 N sodium hydroxide to a pH of 7.55.

*Mobile phase*—Add 20 mL of *Reagent A* to a mixture of 880 mL of water and 100 mL of acetonitrile, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Dissolve an accurately weighed quantity of 1,1-cyclobutanedicarboxylic acid in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL. Transfer 2.0 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*System suitability solution*—Mix 1.0 mL of the *Standard solution* with 1.0 mL of *Standard preparation*, prepared as directed in the *Assay*.

*Test solution*—Transfer about 50 mg of Carboplatin, accurately weighed, to a 50-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.0-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph replicate injections (about 100  $\mu$ L) of the *System suitability solution*, record the chromatograms, and measure the peak responses: the relative retention times are about 0.65 for carboplatin and 1.0 for 1,1-cyclobutanedicarboxylic acid; the column efficiency, determined from the 1,1-cyclobutanedicarboxylic acid peak, is not less than 1500 theoretical plates; the resolution,  $R$ , between carboplatin and 1,1-cyclobutanedicarboxylic acid peaks is not less than 2.5; and the relative standard deviation for replicate injections is not more than 10%.

*Procedure*—Separately inject equal volumes (about 100  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for the 1,1-cyclobutanedicarboxylic acid peaks. Calculate the percentage of 1,1-cyclobutanedicarboxylic acid in the portion of Carboplatin taken by the formula:

$$5(C/W)(r_U/r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of 1,1-cyclobutanedicarboxylic acid in the *Standard solution*,  $W$  is the weight, in mg, of Carboplatin taken to prepare the *Test solution*, and  $r_U$  and  $r_S$  are the peak responses for 1,1-cyclobutanedicarboxylic acid obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% is found.

**Chromatographic purity**—

*Mobile phase*, *Chromatographic system*, and *Procedure*—Proceed as directed in the *Assay*.

*Standard solution*—Quantitatively dilute a volume of the *Standard preparation*, prepared as directed in the *Assay*, with water to obtain a solution having a known concentration of about 2.5  $\mu$ g of USP Carboplatin RS per mL.

*Test solution*—Use the *Assay preparation*.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. The sum of the peak responses, excluding the carboplatin and 1,1-cyclobutanedicarboxylic acid responses, from the *Test solution*, is not more than 2 times the carboplatin response from the *Standard solution*, and no single peak response is greater than that of the carboplatin peak from the *Standard solution*: not more than 0.25% of

any individual impurity is found, and the sum of all impurities is not more than 0.5%.

**Platinum content**—[NOTE—Thoroughly cleanse all glassware with nitric acid and rinse with water to prevent “mirroring” of platinum precipitate.] Transfer about 0.25 g of Carboplatin, accurately weighed, to a 600-mL beaker. Add 400 mL of water, and slowly dissolve by heating almost to the boiling point, stirring frequently with a glass rod. Proceed as directed in the test for *Platinum content* under *Cisplatin*, beginning with “When solution is complete.” The weight of the platinum so obtained is between 52.0% and 53.0% of the carboplatin taken, calculated on the anhydrous basis.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and water (87:13). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Carboplatin RS in water, and quantitatively dilute with water to obtain a solution having a known concentration of about 1 mg per mL. [NOTE—Use this solution within 2 hours.]

**Assay preparation**—Transfer about 50 mg of Carboplatin, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix. [NOTE—Use this solution within 2 hours.]

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector and a 4.0-mm × 30-cm column that contains packing L8. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , is not less than 3.0, the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.5, and the relative standard deviation for replicate injections is not more than 1.2%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_6H_{12}N_2O_4Pt$  in the portion of Carboplatin taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Carboplatin RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Carboplatin for Injection

» Carboplatin for Injection is a sterile, lyophilized mixture of Carboplatin and Mannitol. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_6H_{12}N_2O_4Pt$ .

**Caution:** Great care should be taken in handling Carboplatin because it is a suspected carcinogen.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* <1>, protected from light.

#### USP Reference standards <11>—

USP Carboplatin RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

#### Identification—

**Spray reagent**—Add 5.6 g of stannous chloride to 10 mL of hydrochloric acid, and stir for 5 minutes. [NOTE—It is not necessary that all of the solids dissolve.] Add 90 mL of water and 1 g of potassium iodide, and stir. Prepare this solution fresh daily.

**Standard solution**—Prepare a solution in water containing 10 mg of USP Carboplatin RS per mL.

**Test solution**—Dissolve the contents of 1 container in water to obtain a solution containing 10 mg of carboplatin per mL.

**Procedure**—Separately apply 10  $\mu$ L each of the *Standard solution* and the *Test solution* to a thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel. Place the plate in a chromatographic chamber lined with filter paper and equilibrated for 2 hours with a mixture of acetone and water (80:20). Develop the chromatogram until the solvent front has moved about 10 cm from the origin. Remove the plate from the chamber, and air-dry at room temperature for 2 hours. Spray with the *Spray reagent*, and heat at 110° for 10 minutes: the principal spot from the *Test solution* corresponds in appearance and  $R_f$  value to that obtained from the *Standard solution*.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Bacterial endotoxins** <85>—It contains not more than 0.54 USP Endotoxin Unit per mg of carboplatin.

**pH** <791>: between 5.0 and 7.0, in a solution constituted as directed in the labeling, *Sterile Water for Injection* being used.

**Water, Method I** <921>—Proceed as directed in the test for *Water* under *Cisplatin for Injection*: not more than 3.0% is found.

**Uniformity of dosage units** <905>: meets the requirements.

#### Limit of 1,1-cyclobutanedicarboxylic acid—

**Mobile phase, System suitability solution, and Chromatographic system**—Proceed as directed for *Limit of 1, 1-cyclobutanedicarboxylic acid* under *Carboplatin*.

**Standard solution**—Dissolve an accurately weighed quantity of 1,1-cyclobutanedicarboxylic acid in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Test solution**—Quantitatively dissolve the contents of 1 container in *Mobile phase* to obtain a solution having a concentration of 1 mg of carboplatin per mL. [NOTE—Complete the chromatographic analysis of the solution within 2 hours.]

**Procedure**—Separately inject equal volumes (about 100  $\mu$ L) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the responses for the 1,1-cyclobutanedicarboxylic acid peaks. Calculate the percentage of 1,1-cyclobutanedicarboxylic acid in the portion of Carboplatin for Injection taken by the formula:

$$100(CV / L)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of 1,1-cyclobutanedicarboxylic acid in the *Standard solution*;  $V$  is the volume, in mL, of the constituted container contents;  $L$  is the labeled quantity, in mg, of carboplatin per container; and  $r_U$  and  $r_S$  are the peak responses for 1,1-cyclobutanedicarboxylic acid obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1.0% is found.

**Assay—**

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Carboplatin.

*Assay preparation*—Quantitatively dissolve the contents of 1 container in water to obtain a solution having a concentration of 1 mg per mL. [NOTE—Complete chromatographic analysis of this solution within 2 hours.]

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the Assay preparation and the Standard preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_6H_{12}N_2O_4Pt$  in the portion of Carboplatin for Injection taken by the formula:

$$CV(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Carboplatin RS in the Standard preparation; V is the volume, in mL, of the constituted container contents; and  $r_U$  and  $r_S$  are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Carboprost Tromethamine

$C_{21}H_{36}O_5 \cdot C_4H_{11}NO_3$  489.64

Prosta-5,13-dien-1-oic acid, 9,11,15-trihydroxy-15-methyl-, (5Z,9 $\alpha$ ,11 $\alpha$ ,13E,15S)-, compound with 2-amino-2-(hydroxymethyl)-1,3-propanediol (1:1).

(Z)-7-[(1R,2R,3R,5S)-3,5-Dihydroxy-2-[(E)-(3S)-3-hydroxy-3-methyl-1-octenyl]cyclopentyl]-5-heptenoic acid compound with 2-amino-2-(hydroxymethyl)-1,3-propanediol (1:1).

(15S)-15-Methylprostaglandin F<sub>2 $\alpha$</sub>  tromethamine [58551-69-2].

» Carboprost Tromethamine contains not less than 95.0 percent and not more than 105.0 percent of  $C_{25}H_{47}NO_8$ , calculated on the dried basis.

**Caution**—Great care should be taken to prevent inhaling particles of Carboprost Tromethamine and exposing the skin to it.

**Packaging and storage**—Preserve in well-closed containers, and store in a freezer.

**USP Reference standards** (11)—

USP Carboprost Tromethamine RS

**Identification, Infrared Absorption** (197M).

**Specific rotation** (781S): between +18° and +24°.

*Test solution*: 10 mg per mL, in alcohol.

**Loss on drying** (731)—Dry it in vacuum at a pressure not exceeding 5 mm of mercury at 50° for 16 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Limit of 15R-epimer and 5-trans isomer—**

*Mobile phase, Internal standard preparation, Citrate buffer, and Chromatographic system*—Proceed as directed in the Assay. To evaluate the system suitability requirements, use the Standard preparation prepared as directed in the Assay.

*Test solution*—Use the Assay preparation.

*Procedure*—Inject a volume (about 25  $\mu$ L) of the Test solution into the chromatograph, record the chromatogram,

and measure the peak areas. Calculate the percentage of the 15R-epimer (as the tromethamine salt) in the portion of Carboprost Tromethamine taken by the formula:

$$100r_A / (r_A + r_B + r_C)$$

in which  $r_A$  is the area of any peak at a relative retention time of 0.7;  $r_B$  is the area of any peak at a relative retention time of 1.0; and  $r_C$  is the area of any peak at a relative retention time of about 1.2. Not more than 2.0% is found. Calculate the percentage of the 5-trans isomer (as the tromethamine salt) in the portion of Carboprost Tromethamine taken by the formula:

$$100r_C / (r_A + r_B + r_C)$$

in which the terms are as defined above. Not more than 3.0% is found.

**Assay—**

*Mobile phase*—Prepare a filtered and degassed mixture of methylene chloride, 1,3-butanediol, and water (992:7:0.5). Make adjustments if necessary (see System Suitability under Chromatography (621)).

*Internal standard preparation*—Using the Mobile phase, prepare a solution containing about 7 mg of guaifenesin per mL.

*Citrate buffer*—Dissolve 10.5 g of citric acid in about 75 mL of water. Add 5 N sodium hydroxide slowly to adjust to a pH of 4.0, and dilute with water to 100 mL.

*Standard preparation*—Transfer about 5 mg of USP Carboprost Tromethamine RS, accurately weighed, to a stoppered, 50-mL centrifuge tube. Add 20.0 mL of methylene chloride and 2 mL of Citrate buffer. Shake the stoppered tube for about 10 minutes, and centrifuge. Remove and discard the top (aqueous) layer, and transfer a 4.0-mL aliquot of the lower (methylene chloride) layer to a suitable vial. Evaporate with the aid of a stream of nitrogen to dryness. Add 100  $\mu$ L of a freshly prepared solution of  $\alpha$ -bromo-2'-acetonaphthone in acetonitrile (1 in 50). Swirl to wash down the sides of the vial. Add 50  $\mu$ L of a freshly prepared solution of diisopropylethylamine in acetonitrile (1 in 100), swirl again, and place the vial in a suitable heating device maintained at a temperature of 30° to 35° for not less than 15 minutes. Evaporate the acetonitrile from the vial with the aid of a stream of nitrogen, add 2.0 mL of Internal standard preparation, mix, and pass the resulting solution through a fine-porosity filter. Protect the filtered solution from light prior to injection to prevent degradation of the naphthacyl ester of carboprost.

*Assay preparation*—Proceed as directed for Standard preparation, except to use Carboprost Tromethamine in place of USP Carboprost Tromethamine RS.

*Chromatographic system* (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm stainless steel column that contains 10- $\mu$ m packing L3. The flow rate is about 1.8 mL per minute. Chromatograph the Standard preparation, and record the responses as directed for Procedure: the relative retention times for guaifenesin and the 2-naphthacyl ester of carboprost are about 0.6 and 1.0, respectively; the resolution,  $R$ , between guaifenesin and the 2-naphthacyl ester of carboprost is not less than 4.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of

$C_{25}H_{47}NO_8$  in the portion of Carboprost Tromethamine taken by the formula:

$$W(R_U / R_S)$$

in which  $W$  is the weight, in mg, of USP Carboprost Tromethamine RS taken to prepare the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the 2-naphthacyl ester of carboprost to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Carboprost Tromethamine Injection

» Carboprost Tromethamine Injection is a sterile solution of Carboprost Tromethamine in aqueous solution, which may also contain Benzyl Alcohol, Sodium Chloride, and Tromethamine. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of carboprost ( $C_{21}H_{36}O_5$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, and store in a refrigerator.

### USP Reference standards (11)—

USP Carboprost Tromethamine RS  
USP Endotoxin RS

### Identification, Infrared Absorption (197K)—

**Test specimen**—Extract a volume of Injection, equivalent to about 2.5 mg of carboprost tromethamine, with 1.5 to 2 times its volume of chloroform. Discard the chloroform layer, and acidify the aqueous layer with 3 to 5 drops of hydrochloric acid. Extract the acidified solution with an equivalent volume of chloroform. Filter the chloroform layer through a pledget of cotton, and concentrate it to a volume of less than 1 mL. Combine the resulting solution with 150 to 180 mg of potassium bromide. Dry the potassium bromide mixture in vacuum overnight, and prepare a pellet from the dried mixture.

**Bacterial endotoxins** (85): not more than 714.3 USP Endotoxin Units per mg of carboprost tromethamine.

**pH** (791): between 7.0 and 8.0.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

**Mobile phase and Citrate buffer**—Prepare as directed in the *Assay* under *Carboprost Tromethamine*.

**Internal standard preparation**—Using the *Mobile phase*, prepare a solution containing about 3 mg of guaifenesin per mL.

**Standard preparation**—Using an accurately weighed quantity of USP Carboprost Tromethamine RS, prepare a Standard solution containing about 0.332 mg of USP Carboprost Tromethamine RS per mL and 9 mg of benzyl alcohol per mL. Transfer 2.0 mL of the solution so obtained into a stoppered centrifuge tube. Add 20.0 mL of methylene chloride and 1.0 mL of *Citrate buffer*, shake the stoppered tube for about 10 minutes, and centrifuge. Remove and discard the top (aqueous) layer, transfer an 8.0-mL aliquot of the lower (methylene chloride) layer to a suitable vial, and evaporate the solution with the aid of a stream of nitrogen. [NOTE—The residue does not evaporate to dryness because of the presence of benzyl alcohol.] Add 100  $\mu$ L of a freshly prepared solution of  $\alpha$ -bromo-2'-acetonaphthone in acetonitrile (1 in 50), and swirl to wash down the sides of the vial. Add 50  $\mu$ L of a freshly prepared solution of diisopropylethylamine in acetonitrile (1 in 100). Swirl again, and place the vial in a

suitable heating device maintained at a temperature of 30° to 35° for not less than 15 minutes. Evaporate the acetonitrile from the vial with the aid of a stream of nitrogen, add 1.0 mL of *Internal standard preparation*, mix, and pass the resulting solution through a fine-porosity filter. Protect the filtered solution from light prior to injection to prevent degradation of the naphthacyl ester of carboprost.

**Assay preparation**—Pipet an accurately measured volume of Injection, equivalent to about 500  $\mu$ g of carboprost, to a stoppered, 50-mL centrifuge tube. Proceed as directed for *Standard preparation*, beginning with "Add 20.0 mL of methylene chloride".

**Chromatographic system**—Proceed as directed in the *Assay* under *Carboprost Tromethamine*. To evaluate the system suitability requirements, use the *Standard preparation* prepared as directed in the *Assay* under *Carboprost Tromethamine*.

**Procedure**—Proceed as directed in the *Assay* under *Carboprost Tromethamine*. Calculate the quantity, in  $\mu$ g, of carboprost ( $C_{21}H_{36}O_5$ ) in each mL of Injection taken by the formula:

$$(368.51/489.64)C(R_U / R_S)$$

in which 368.51 and 489.64 are the molecular weights of carboprost and carboprost tromethamine, respectively;  $C$  is the concentration, in  $\mu$ g per mL, of USP Carboprost Tromethamine RS in the Standard solution used to prepare the *Standard preparation*; and the other terms are as defined therein.

## Carboxymethylcellulose Sodium

Cellulose carboxymethyl ether sodium salt [9004-32-4].

### DEFINITION

Carboxymethylcellulose Sodium is the sodium salt of a polycarboxymethyl ether of cellulose. It contains NLT 6.5% and NMT 9.5% of sodium (Na), calculated on the dried basis.

### IDENTIFICATION

#### • A. PROCEDURE

**Sample solution:** Add 1 g of powdered Carboxymethylcellulose Sodium to 50 mL of water, while stirring to produce a uniform dispersion. Continue the stirring until a clear solution is produced.

**Analysis:** To 1 mL of the *Sample solution*, diluted with an equal volume of water in a small test tube, add 5 drops of 1-naphthol TS. Incline the test tube, and carefully introduce down the side of the tube 2 mL of sulfuric acid so that it forms a lower layer.

**Acceptance criteria:** A red-purple color develops at the interface.

#### • B. PROCEDURE

**Sample solution:** Use the *Sample solution* from *Identification* test A.

**Analysis:** To 5 mL of the *Sample solution*, add an equal volume of barium chloride TS.

**Acceptance criteria:** A fine, white precipitate is formed.

#### • C. IDENTIFICATION TESTS—GENERAL, Sodium (191):

A portion of the *Sample solution* meets the requirements.

**Sample solution:** Use the *Sample solution* from *Identification* test A.

### ASSAY

#### • PROCEDURE

**Sample solution:** Transfer to a beaker 500 mg of Carboxymethylcellulose Sodium, add 80 mL of glacial acetic acid, heat the mixture in a boiling water bath for 2 h, and cool to room temperature.

**Analysis:** Titrate the *Sample solution* with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Each mL of 0.1 N perchloric acid is equivalent to 2.299 mg of Na.

**Acceptance criteria:** NLT 6.5% and NMT 9.5% of Na, on the dried basis

## IMPURITIES

### Inorganic Impurities

- **HEAVY METALS, Method II <231>:** NMT 20 ppm, adding 1 mL of hydroxylamine hydrochloride solution (1 in 5) to the solution of the residue

## SPECIFIC TESTS

### • ROTATIONAL RHEOMETER METHODS <912>

**Analysis:** Determine the viscosity in a water solution at the concentration stated on the label. Using undried Carboxymethylcellulose Sodium, weigh the amount that, on the dried basis, will provide 200 g of solution of the stated concentration. Add the substance in small amounts to 180 mL of stirred water contained in a tared, wide-mouth bottle, continue stirring rapidly until the powder is well wetted, add sufficient water to make the mixture weigh 200 g, and allow to stand, with occasional stirring, until solution is complete. Adjust the temperature to  $25 \pm 0.2^\circ$ , and determine the viscosity, using a rotational type of viscometer, making certain that the system reaches equilibrium before taking the final reading.

**Acceptance criteria:** The viscosity of solutions of 2% or higher concentration is NLT 80.0% and NMT 120.0% of that stated on the label; the viscosity of solutions of less than 2% concentration is NLT 75.0% and NMT 140.0% of that stated on the label.

- **PH <791>:** 6.5–8.5 in a solution (1 in 100)
- **LOSS ON DRYING <731>:** Dry a sample at  $105^\circ$  for 3 h: it loses NMT 10.0% of its weight.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate the viscosity in solutions of stated concentrations.

# Carboxymethylcellulose Sodium Paste

## DEFINITION

Carboxymethylcellulose Sodium Paste contains NLT 16.0% and NMT 17.0% of carboxymethylcellulose sodium.

## IDENTIFICATION

- **A.**

**Sample solution:** Digest a quantity of Paste, equivalent to 1 g of carboxymethylcellulose sodium, with 50 mL of water until the solution is virtually complete. Filter.

**Analysis:** To 30 mL of the *Sample solution* add 3 mL of hydrochloric acid. Filter the solution, and save the filtrate for *Identification* test C.

**Acceptance criteria:** A white precipitate is formed.
- **B.**

**Sample solution:** The remainder of the *Sample solution* prepared in *Identification* test A

**Analysis:** To the *Sample solution* add an equal volume of barium chloride TS.

**Acceptance criteria:** A fine, white precipitate is formed.
- **C. IDENTIFICATION TESTS—GENERAL, Sodium <191>:** The filtrate from *Identification* test A meets the requirements of the tests.

## ASSAY

### • PROCEDURE

**Sample:** 2 g

**Titrimetric system**

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.1 N perchloric acid in dioxane VS

**Endpoint detection:** Potentiometric

**Analysis:** Transfer the *Sample* to a glass-stoppered, 250-mL conical flask. Add 75 mL of glacial acetic acid, attach a condenser, and reflux for 2 h. Cool, transfer the mixture to a 250-mL beaker with the aid of small volumes of glacial acetic acid. Titrate with *Titrant*. Each mL of 0.1 N perchloric acid is equivalent to 29.67 mg of carboxymethylcellulose sodium.

**Acceptance criteria:** 16.0%–17.0%

## IMPURITIES

### • HEAVY METALS, Method II <231>

**Test preparation:** Prepare as directed in the chapter, using 400 mg of Paste and adding 1 mL of hydroxylamine hydrochloride solution (200 mg/mL) to the solution of the residue.

**Acceptance criteria:** NMT 50 µg/g

## SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS <61> and TESTS FOR SPECIFIED MICROORGANISMS <62>:** The total bacterial count does not exceed  $10^3$  cfu/g, and the tests for *Salmonella* species and *Escherichia coli* are negative.

### • CONSISTENCY

**Apparatus:** A penetrometer fitted with a polished cone-shaped metal plunger weighing 150 g, having a detachable steel tip of the following dimensions: the tip of the cone has an angle of  $30^\circ$ ; the point of the tip is truncated to a diameter of  $0.381 \pm 0.025$  mm; the base of the tip is  $8.38 \pm 0.05$  mm in diameter; and the length of the tip is  $14.94 \pm 0.05$  mm.

The remaining portion of the cone has an angle of  $90^\circ$ , is 28 mm in height, and has a maximum diameter at the base of 65 mm. The containers for the test are flat-bottom metal cylinders that are  $100 \pm 6$  mm in diameter and NLT 65 mm in height. They are constructed of at least 1.6-mm (16-gauge) metal, and are provided with well-fitting, water-tight covers.

**Sample:** Paste

**Analysis:** Place the required number of containers in an oven, bring them and a quantity of the *Sample* to a temperature of  $82 \pm 2.5^\circ$ , and pour the *Sample* into one or more of the containers, filling to within 6 mm of the rim. Cool to  $25 \pm 2.5^\circ$  over a period of NLT 16 h, protected from drafts. Two h before the test, place the containers in a water bath at  $25 \pm 0.5^\circ$ . If the room temperature is below  $23.5^\circ$  or above  $26.5^\circ$ , adjust the temperature of the cone to  $25 \pm 0.5^\circ$  by placing it in the water bath.

Without disturbing the surface of the substance under test, place the container on the penetrometer table, and lower the cone until the tip just touches the top surface of the test substance at a spot 25–38 mm from the edge of the container. Adjust the zero setting and quickly release the plunger, then hold it free for 5 s. Secure the plunger, and read the total penetration from the scale. Make three or more trials, each so spaced that there is no overlapping of the areas of penetration. Where the penetration exceeds 20 mm, use a separate container of the test substance for each trial. Read the penetration to the nearest 0.1 mm.

Calculate the average of the three or more readings, and conduct further trials to a total of 10 if the individual results differ from the average by more than  $\pm 3\%$ .

**Acceptance criteria:** The final average of the trials is 30.0–36.0 mm, indicating a consistency value of between 300 and 360.

- **LOSS ON DRYING** (731)  
Analysis: Dry at 105° for 3 h.  
Acceptance criteria: NMT 2.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and avoid prolonged exposure to temperatures exceeding 30°.

**Carboxymethylcellulose Sodium Tablets**

» Carboxymethylcellulose Sodium Tablets contain an amount of sodium (Na) equivalent to not less than 6.5 percent and not more than 9.5 percent of the labeled amount of carboxymethylcellulose sodium.

**Packaging and storage**—Preserve in tight containers.

**Identification**—Digest a quantity of powdered Tablets, equivalent to about 1 g of carboxymethylcellulose sodium, with 50 mL of water until solution is virtually complete, and filter: the filtrate responds to the following tests.

A: To about 30 mL of the solution add 3 mL of hydrochloric acid: a white precipitate is formed.

B: To the remainder of the solution add an equal volume of barium chloride TS: a fine, white precipitate is formed.

C: The filtrate from *Identification* test A responds to the tests for *Sodium* (191).

**Disintegration** (701): 2 hours.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—Weigh and finely powder not less than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 500 mg of carboxymethylcellulose sodium, add 80 mL of glacial acetic acid, heat the mixture on a steam bath for 2 hours, cool to room temperature, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Each mL of 0.1 N perchloric acid is equivalent to 2.299 mg of Na.

**Carisoprodol**

$C_{12}H_{24}N_2O_4$  260.33  
(±)-2-Methyl-2-propyl-1,3-propanediol carbamate isopropylcarbamate [78-44-4].

**DEFINITION**

Carisoprodol contains NLT 98.0% and NMT 102.0% of  $C_{12}H_{24}N_2O_4$ , calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak in the *Sample solution* corresponds to that in the *Standard solution* as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Diluent:** Acetonitrile and water (50:50)

**Solution A:** Acetonitrile and water (25:75)

**Solution B:** Acetonitrile

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
35	100	0
36	80	20
51	80	20
52	100	0
60	100	0

**System suitability solution:** 0.125 mg/mL each of USP Carisoprodol Related Compound A RS, USP Meprobamate RS, and USP Carisoprodol RS in *Diluent*

**Standard solution:** 2.5 mg/mL of USP Carisoprodol RS in *Diluent*

**Sample solution:** 2.5 mg/mL of Carisoprodol in *Diluent*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 200 nm

**Column:** 4.6-mm × 15-cm; 4-μm packing L1

**Column temperature:** 30°

**Flow rate:** 1.5 mL/min

**Injection size:** 25 μL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—See *Table 2* for the relative retention times.]

**Suitability requirements**

**Resolution:** NLT 1.5 between carisoprodol related compound A and meprobamate, *System suitability solution*

**Tailing factor:** NMT 2.5 for the carisoprodol peak, *Standard solution*

**Relative standard deviation:** NMT 2.0% for the carisoprodol peak, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of carisoprodol ( $C_{12}H_{24}N_2O_4$ ) in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of carisoprodol from the *Sample solution*

$r_S$  = peak response of carisoprodol from the *Standard solution*

$C_S$  = concentration of USP Carisoprodol RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Carisoprodol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES**

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **HEAVY METALS, Method II** (231): NMT 10 ppm

• **ORGANIC IMPURITIES**

**Diluent, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 10 μg/mL of USP Carisoprodol RS in *Diluent*

**Sample solution:** 50 mg/mL of Carisoprodol in *Diluent*.  
[NOTE—Sonication may be used to aid dissolution.]

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*  
[NOTE—See *Table 2* for the relative retention times.]

**Suitability requirements**

**Resolution:** NLT 1.5 between carisoprodol related compound A and meprobamate, *System suitability solution*

**Tailing factor:** NMT 2.5 for the carisoprodol peak, *Standard solution*

**Relative standard deviation:** NMT 5.0% for the carisoprodol peak, 3 replicate injections of *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Identify the specified impurities using the relative retention times given in *Table 2*.  
Calculate the percentage of each impurity in the portion of Carisoprodol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of the impurity from the *Sample solution*

$r_S$  = peak response of carisoprodol from the *Standard solution*

$C_S$  = concentration of USP Carisoprodol RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Carisoprodol in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 2*)

**Acceptance criteria:** See *Table 2*.

**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Carisoprodol related compound A <sup>a</sup>	0.19	0.06	0.1
Meprobamate	0.24	0.08	0.5
Carisoprodol monocarbamate <sup>b</sup>	0.86	1.4	0.1

Any other unknown individual impurity	—	1.0	0.1
Total impurities	—	—	1.0

<sup>a</sup> 2-Hydroxymethyl-2-methylpentyl carbamate.

<sup>b</sup> N-Isopropyl-2-hydroxymethyl-2-methylpentyl carbamate.

**SPECIFIC TESTS**

- LOSS ON DRYING (731):** Dry a sample in vacuum at 60° for 3 h; it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight containers at room temperature.
- USP REFERENCE STANDARDS (11)**
  - USP Carisoprodol RS
  - USP Carisoprodol Related Compound A RS
  - 2-Hydroxymethyl-2-methylpentyl carbamate,  $C_8H_{17}NO_3$  175.23
  - USP Meprobamate RS

## Carisoprodol Tablets

**DEFINITION**

Carisoprodol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of carisoprodol ( $C_{12}H_{24}N_2O_4$ ).

**IDENTIFICATION**

- A.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

**PROCEDURE**

**Diluent:** Acetonitrile and water (50:50)

**Mobile phase:** Acetonitrile and water (25:75)

**System suitability solution:** 0.1 mg/mL each of USP Carisoprodol Related Compound A RS, USP Meprobamate RS, and USP Carisoprodol RS in *Diluent*

**Standard solution:** 2.5 mg/mL of USP Carisoprodol RS in *Diluent*

**Sample solution:** Nominally 2.5 mg/mL in *Diluent* prepared as follows. Transfer an amount equivalent to the label claim of carisoprodol from powdered Tablets (NLT 20) to a suitable volumetric flask, and fill 50% of the flask volume with *Diluent*. Place in an ultrasonic bath for 30 min, and shake mechanically for 60 min. Dilute with *Diluent* to volume. Pass a portion of this solution through a suitable membrane filter, and use the filtrate as the *Sample solution*.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 200 nm

**Column:** 4.6-mm × 15 cm; 4-μm packing L1

**Column temperature:** 30°

**Flow rate:** 1.5 mL/min

**Injection size:** 25 μL

**Run time:** 1.5 times the retention time of carisoprodol

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

**Suitability requirements**

**Resolution:** NLT 1.5 between carisoprodol related compound A and meprobamate, *System suitability solution*

**Tailing factor:** NMT 2.5 for the carisoprodol peak, *Standard solution*

**Relative standard deviation:** NMT 2.0% for the carisoprodol peak, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of carisoprodol ( $C_{12}H_{24}N_2O_4$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of carisoprodol from the *Sample solution*

$r_S$  = peak response of carisoprodol from the *Standard solution*

$C_S$  = concentration of USP Carisoprodol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of carisoprodol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

**DISSOLUTION (711)**

**Medium:** 0.05 M phosphate buffer, pH 6.9 (see *Reagents, Indicators, and Solutions—Buffer Solutions*) containing 5 units of α-amylase per mL; 900 mL

[NOTE—Use only freshly prepared solutions containing α-amylase; and equilibrate the *Medium* at 37° for NMT 1 h before beginning the *Dissolution* test.]

**Apparatus 2:** 75 rpm

**Time:** 60 min

**Mobile phase:** Acetonitrile and water (40:60)

**System suitability solution:** 2.4 mg/mL of 2-methyl-2-propyl-1,3-propanediol and 3.4 mg/mL of USP Carisoprodol RS in *Mobile phase*

**Standard solution:** 0.4 mg/mL of USP Carisoprodol RS in *Medium*

[NOTE—A volume of acetonitrile not exceeding 2% of the final total volume of solution may be used to aid in dissolving the carisoprodol.]

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Refractive index

**Column:** 3.9-mm × 30-cm; packing L1

**Temperature:** 30 ± 1° for column and detector

**Flow rate:** 2 mL/min

**Injection size:** 150 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for 2-methyl-2-propyl-1,3-propanediol and carisoprodol are about 0.5 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between 2-methyl-2-propyl-1,3-propanediol and carisoprodol, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for 3 replicate injections of the *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Record the peak responses, and measure the heights for the major peaks.

Calculate the percentage of the labeled amount of carisoprodol (C<sub>12</sub>H<sub>24</sub>N<sub>2</sub>O<sub>4</sub>) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Carisoprodol RS in the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of carisoprodol (C<sub>12</sub>H<sub>24</sub>N<sub>2</sub>O<sub>4</sub>) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### IMPURITIES

##### • ORGANIC IMPURITIES

**Diluent, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 10 µg/mL of USP Carisoprodol RS in *Diluent*

**Sample solution:** Nominally 10 mg/mL in *Diluent* prepared as follows. Transfer an amount equivalent to four times the label claim of carisoprodol from powdered Tablets (NLT 20 Tablets) to a suitable volumetric flask, and fill 50% of the flask volume with *Diluent*. Place in an ultrasonic bath for 30 min, and shake mechanically for 60 min. Dilute with *Diluent* to volume. Pass a portion of this solution through a suitable membrane filter, and use the filtrate as the *Sample solution*.

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

#### Suitability requirements

**Resolution:** NLT 1.5 between carisoprodol related compound A and meprobamate, *System Suitability solution*

**Tailing factor:** NMT 2.5 for the carisoprodol peak, *Standard solution*

**Relative standard deviation:** NMT 5.0% for the carisoprodol peak for 3 replicate injections of the *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Identify the specified impurities using the relative retention times given in *Table 1*.

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of the impurity from the *Sample solution*

$r_S$  = peak response of carisoprodol from the *Standard solution*

$C_S$  = concentration of USP Carisoprodol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of carisoprodol in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 1*).

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Carisoprodol related compound A <sup>a</sup>	0.19	0.06	0.75
Meprobamate	0.24	0.08	0.65
Carisoprodol monocarbamate <sup>b</sup>	0.86	1.4	0.20
Carisoprodol	1.0	—	—
Any other unknown degradation product	—	1.0	0.20
Total impurities	—	—	1.25

<sup>a</sup> 2-Hydroxymethyl-2-methylpentyl carbamate.

<sup>b</sup> N-Isopropyl-2-hydroxymethyl-2-methylpentyl carbamate.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers at controlled room temperature.
- **USP REFERENCE STANDARDS** <11>
  - USP Carisoprodol RS
  - USP Carisoprodol Related Compound A RS
  - 2-Hydroxymethyl-2-methylpentyl carbamate.
  - C<sub>8</sub>H<sub>17</sub>NO<sub>3</sub> 175.23

### Carisoprodol and Aspirin Tablets

» Carisoprodol and Aspirin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of carisoprodol (C<sub>12</sub>H<sub>24</sub>N<sub>2</sub>O<sub>4</sub>) and aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Aspirin RS

USP Carisoprodol RS

USP Salicylic Acid RS

**Identification**—The retention times of the aspirin peak and the carisoprodol peak in the chromatogram of the *Assay preparation* correspond to those of the aspirin peak and the carisoprodol peak in the chromatogram of the *Aspirin and carisoprodol standard preparation*, as obtained under *Assay for aspirin and carisoprodol and limit of free salicylic acid*.

**Dissolution** (711)—

Medium: water; 900 mL.

Apparatus 2: 75 rpm.

Time: 45 minutes.

**Mobile phase**—Mix 510 mL of methanol, previously filtered through a membrane filter of 0.5  $\mu\text{m}$  or finer porosity, and 490 mL of glacial acetic acid solution (1 in 50), similarly filtered, and degas.

**Standard preparation**—Transfer about 90 mg of USP Aspirin RS and 90 mg of USP Carisoprodol RS, both accurately weighed, to a 250-mL volumetric flask, *J* being the ratio of the labeled amount, in mg, of carisoprodol to that of aspirin. Add 5 mL of acetonitrile, previously filtered through a membrane filter of 0.5  $\mu\text{m}$  or finer porosity, swirl to dissolve, dilute with water to volume, and mix.

**Resolution solution**—Dissolve salicylic acid in *Standard preparation* to obtain a solution containing about 0.36 mg of salicylic acid per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a refractive index detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. Maintain the detector and the column at  $30 \pm 1^\circ$ . The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between the aspirin and salicylic acid peaks, and between the carisoprodol and salicylic acid peaks, is not less than 1.5; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 300  $\mu\text{L}$ ) of the *Standard preparation* and the solution under test, previously filtered, into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.4 for aspirin and 1.0 for carisoprodol. Calculate the quantity, in mg, of aspirin ( $\text{C}_9\text{H}_8\text{O}_4$ ) dissolved by the formula:

$$0.9C(r_U / r_S)$$

in which *C* is the concentration, in  $\mu\text{g}$  per mL, of USP Aspirin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained for aspirin from the solution under test and the *Standard preparation*, respectively. Calculate the quantity, in mg, of carisoprodol ( $\text{C}_{12}\text{H}_{24}\text{N}_2\text{O}_4$ ) dissolved by the same formula, except to read "USP Carisoprodol RS" where "USP Aspirin RS" is specified, and "carisoprodol" where "aspirin" is specified.

**Tolerances**—Not less than 75% (*Q*) of the labeled amounts of  $\text{C}_9\text{H}_8\text{O}_4$  and  $\text{C}_{12}\text{H}_{24}\text{N}_2\text{O}_4$  are dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Content Uniformity* with respect to aspirin and to carisoprodol.

**Assay for aspirin and carisoprodol and limit of free salicylic acid**—

**Mobile phase**—Mix 5 mL of glacial acetic acid and 500 mL of water, and pass through a membrane filter of 0.5  $\mu\text{m}$  or finer porosity. Add 360 mL of the filtrate to 640 mL of methanol, similarly filtered, mix, and degas. Make adjust-

ments if necessary (see *System Suitability* under *Chromatography* (621)).

**Solvent mixture**—Prepare a mixture of water, acetonitrile, and glacial acetic acid (59:40:1).

**Aspirin and carisoprodol standard preparation**—Transfer about 80 mg of USP Aspirin RS and 80 mg of USP Carisoprodol RS, both accurately weighed, to a 25-mL volumetric flask, *J* being the ratio of the labeled amount, in mg, of carisoprodol to that of aspirin. Add about 15 mL of *Solvent mixture*, swirl for 5 minutes, and sonicate for 25 to 30 seconds. Dilute with *Solvent mixture* to volume, and mix.

**Salicylic acid standard preparation**—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in *Solvent mixture* to obtain a solution having a known concentration of about 16  $\mu\text{g}$  per mL.

**Resolution solution**—Dissolve salicylic acid in *Aspirin and carisoprodol standard preparation* to obtain a solution containing about 0.5 mg of salicylic acid per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 325 mg of aspirin, to a 100-mL volumetric flask. Add about 50 mL of *Solvent mixture*, swirl for 5 minutes, sonicate for 25 to 30 seconds, shake by mechanical means for 30 minutes, dilute with *Solvent mixture* to volume, and mix. Pass a portion of this solution through a membrane filter of 0.5  $\mu\text{m}$  or finer porosity, and use the filtrate as the *Assay preparation*. [NOTE—Use within 8 hours.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a refractive index detector, a 313-nm detector, and a 4.6-mm  $\times$  25-cm column that contains packing L7. Maintain the refractive index detector and the column at  $30 \pm 1^\circ$ . The flow rate is about 1 mL per minute. Chromatograph the *Aspirin and carisoprodol standard preparation* and the *Resolution solution*, and record the peak responses as directed under *Procedure*, using the refractive index detector: the resolution, *R*, between the solvent and aspirin peaks in the chromatogram of the *Resolution solution* is not less than 1.2; the resolution, *R*, between the aspirin and salicylic acid peaks is not less than 1.5; and the relative standard deviation for replicate injections of the *Aspirin and carisoprodol standard preparation* is not more than 2.0%. Chromatograph the *Salicylic acid standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu\text{L}$ ) of the *Aspirin and carisoprodol standard preparation*, the *Salicylic acid standard preparation*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks, using the refractive index detector for the *Aspirin and carisoprodol standard preparation*, the 313-nm detector for the *Salicylic acid standard preparation*, and both detectors for the *Assay preparation*. The relative retention times are about 0.6 for aspirin, 0.7 for salicylic acid, and 1.0 for carisoprodol. Calculate the quantity, in mg, of aspirin ( $\text{C}_9\text{H}_8\text{O}_4$ ) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Aspirin RS in the *Aspirin and carisoprodol standard preparation*; and  $r_U$  and  $r_S$  are the peak responses, with the use of the refractive index detector, obtained for aspirin from the *Assay preparation* and the *Aspirin and carisoprodol standard preparation*, respectively. Calculate the quantity, in mg, of carisoprodol ( $\text{C}_{12}\text{H}_{24}\text{N}_2\text{O}_4$ ) in the portion of Tablets taken by the same formula, except to read "USP Carisoprodol RS" where "USP Aspirin RS" is specified, and "carisoprodol" where "as-

pirin" is specified. Calculate the percentage of free salicylic acid in the Tablets taken by the formula:

$$10(C/a)(r_U/r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Salicylic Acid RS in the *Salicylic acid standard preparation*;  $a$  is the quantity, in mg, of aspirin in the portion of Tablets taken, based on the labeled amount; and  $r_U$  and  $r_S$  are the peak responses, with the use of the 313-nm detector, obtained for salicylic acid from the *Assay preparation* and the *Salicylic acid standard preparation*, respectively: not more than 3.0% is found.

## Carisoprodol, Aspirin, and Codeine Phosphate Tablets

» Carisoprodol, Aspirin, and Codeine Phosphate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of carisoprodol ( $\text{C}_{12}\text{H}_{24}\text{N}_2\text{O}_4$ ), aspirin ( $\text{C}_9\text{H}_8\text{O}_4$ ), and codeine phosphate ( $\text{C}_{18}\text{H}_{21}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ ).

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards (11)—

USP Aspirin RS  
USP Carisoprodol RS  
USP Codeine Phosphate RS  
USP Codeine N-Oxide RS  
 $\text{C}_{18}\text{H}_{21}\text{O}_4$  315.37  
USP Salicylic Acid RS

**Identification**—The retention times of the aspirin, carisoprodol, and codeine phosphate peaks in the chromatograms of the *Assay preparations* correspond to those of the *Standard preparations* obtained as directed in the *Assay for aspirin and carisoprodol and limit of free salicylic acid* and the *Assay for codeine phosphate*.

### Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 75 rpm.

Time: 45 minutes.

**Determination of dissolved aspirin and carisoprodol**—Proceed as directed in the test for *Dissolution* under *Carisoprodol and Aspirin Tablets*.

**Determination of dissolved codeine phosphate**—

**MOBILE PHASE**—Dissolve 2.2 g of docusate sodium and 0.8 g of ammonium nitrate in 550 mL of water, and filter through a membrane filter of 0.5  $\mu\text{m}$  or finer porosity. Add 450 mL of similarly filtered acetonitrile to the filtrate, mix, and degas.

**STANDARD PREPARATION**—Dissolve an accurately weighed quantity of USP Codeine Phosphate RS in water to obtain a solution having a known concentration of about 18  $\mu\text{g}$  per mL.

**CHROMATOGRAPHIC SYSTEM** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**PROCEDURE**—Separately inject equal volumes (about 50  $\mu\text{L}$ ) of the *Standard preparation* and the solution under test, previously filtered, into the chromatograph, record the chromatograms, and measure the responses for the major peaks.

Calculate the quantity, in mg, of codeine phosphate ( $\text{C}_{18}\text{H}_{21}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$ ) dissolved by the formula:

$$(406.37 / 397.37)(0.9C)(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Codeine Phosphate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses for the codeine phosphate peaks from the solution under test and the *Standard preparation*, respectively.

**Tolerances**—Not less than 75% (Q) of the labeled amounts of  $\text{C}_9\text{H}_8\text{O}_4$ ,  $\text{C}_{12}\text{H}_{24}\text{N}_2\text{O}_4$ , and  $\text{C}_{18}\text{H}_{21}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$  are dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Content Uniformity* with respect to aspirin, to carisoprodol, and to codeine phosphate.

### Assay for aspirin and carisoprodol and limit of free salicylic acid—

**Mobile phase, Solvent mixture, Aspirin and carisoprodol standard preparation, Salicylic acid standard preparation, and Resolution solution**—Prepare as directed in the *Assay for aspirin and carisoprodol and limit of free salicylic acid* under *Carisoprodol and Aspirin Tablets*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 325 mg of aspirin, to a 100-mL volumetric flask. Add about 50 mL of *Solvent mixture*, swirl for 5 minutes, sonicate for 25 to 30 seconds, shake by mechanical means for 30 minutes, dilute with *Solvent mixture* to volume, and mix. Pass a portion of this solution through a membrane filter of 0.5  $\mu\text{m}$  or finer porosity, and use the filtrate as the *Assay preparation*.

**Chromatographic system and Procedure**—Proceed as directed in the *Assay for aspirin and carisoprodol and limit of free salicylic acid* under *Carisoprodol and Aspirin Tablets*.

### Assay for codeine phosphate—

**Mobile phase**—Dissolve 2.2 g of docusate sodium in 600 mL of methanol. Dissolve 0.8 g of ammonium nitrate in 400 mL of water. Mix these two solutions, adjust with glacial acetic acid to a pH of  $3.3 \pm 0.05$ , filter through a membrane filter of 0.5  $\mu\text{m}$  or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Solvent mixture**—Mix equal volumes of methanol and 0.01 N sulfuric acid.

**Standard preparation**—Dissolve accurately weighed quantities of USP Codeine Phosphate RS and USP Aspirin RS in *Solvent mixture*, with the aid of swirling for 5 minutes and sonication for 25 to 30 seconds, to obtain a solution having known concentrations of about 0.16 mg of codeine phosphate and 0.16/ mg of aspirin per mL,  $J$  being the ratio of the labeled amount, in mg, of aspirin to that of codeine phosphate.

**Resolution solution**—Transfer about 8 mg of USP Codeine Phosphate RS to a 50-mL volumetric flask containing about 6 mg of USP Codeine N-Oxide RS, dilute with *Solvent mixture* to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 16 mg of codeine phosphate, to a 100-mL volumetric flask. Add about 50 mL of *Solvent mixture*, sonicate for 30 minutes, shake by mechanical means for about 30 minutes, dilute with *Solvent mixture* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the reso-

lution,  $R$ , between the codeine phosphate and codeine  $N$ -Oxide peaks is not less than 1.2; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.9 for codeine  $N$ -Oxide and 1.0 for codeine phosphate. Calculate the quantity, in mg, of codeine phosphate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) in the portion of Tablets taken by the formula:

$$(406.37)(397.37)(100C)(r_U / r_S)$$

in which 406.37 and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively;  $C$  is the concentration, in mg per mL, of USP Codeine Phosphate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses for the codeine phosphate peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Carmustine

$C_5H_9Cl_2N_3O_2$  214.05  
Urea,  $N,N'$ -bis(2-chloroethyl)- $N$ -nitroso-;  
1,3-Bis(2-chloroethyl)-1-nitrosourea [154-93-8].

### DEFINITION

Carmustine contains NLT 98.0% and NMT 102.0% of  $C_5H_9Cl_2N_3O_2$ , calculated on the anhydrous and solvent-free basis.

**[CAUTION]**—Use appropriate surgical gloves, arm covers, and a dust mask. Perform all work under a fume hood approved for testing cytotoxic agents when possible.]

### IDENTIFICATION

#### A. INFRARED ABSORPTION (197F)

**Sample:** Melt a small portion of the sample in a suitable container in a controlled water bath or oven, and set the temperature between 33° and 40°.

**Standard:** A similar preparation of USP Carmustine RS

- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

[NOTE—Prepare solutions in low-actinic glassware, and keep them refrigerated until use.]

**Mobile phase:** Acetonitrile and water (3:7)

**Standard solution:** 1.5 mg/mL of USP Carmustine RS in acetonitrile

**Sample solution:** 1.5 mg/mL of Carmustine in acetonitrile

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 200 nm

**Refrigerated autosampler temperature:** 4°–5°

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

### Suitability requirements

**Tailing factor:** NMT 1.9

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_5H_9Cl_2N_3O_2$  in the portion of Carmustine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Carmustine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Carmustine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous and solvent-free basis

### IMPURITIES

#### Inorganic Impurities

- HEAVY METALS, Method II (231):** NMT 20 ppm

#### Organic Impurities

- PROCEDURE 1: LIMIT OF ETHER-INSOLUBLE SUBSTANCES**

[NOTE— Perform in a well-ventilated fume hood.]

**Analysis:** Transfer 1.0 g of sample to a suitable container containing 10 mL of anhydrous ether, stir for 5 min, and immediately filter through a tared glass-filtering crucible of medium pore size. Wash the container with an additional 10 mL of ether, and filter through the same glass-filtering crucible. Dry the crucible at 105° for 1 h. Cool in a desiccator and weigh.

**Acceptance criteria:** The weight of the residue does not exceed 0.1%.

- PROCEDURE 2: LIMIT OF CARMUSTINE RELATED COMPOUND A**

[NOTE— Prepare solutions in low-actinic glassware, and keep them refrigerated until use.]

**Mobile phase, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Carmustine standard solution:** Use the *Standard solution*, prepared as directed in the *Assay*.

**Standard stock solution:** 0.75 mg/mL of USP Carmustine Related Compound A RS in acetonitrile

**Standard solution:** 0.0075 mg/mL of USP Carmustine Related Compound A RS in acetonitrile, from the *Standard stock solution*

**System suitability solution 1:** 0.75  $\mu$ g/mL of USP Carmustine Related Compound A RS in acetonitrile, from the *Standard solution*

**System suitability solution 2:** Transfer 5.0 mL of *Carmustine standard solution* and 10.0 mL of *Standard stock solution* into a 100-mL volumetric flask, and dilute with acetonitrile to volume. Transfer 5.0 mL of this solution into a 50-mL volumetric flask, and dilute with acetonitrile to volume.

#### System suitability

**Samples:** *Carmustine standard solution*, *System suitability solution 1*, and *System suitability solution 2*

[NOTE— The relative retention times for carmustine related compound A and carmustine are 0.3 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 10 between carmustine related compound A and carmustine, *System suitability solution 2*

**Tailing factor:** NMT 1.9, *Carmustine standard solution*  
**Relative standard deviation:** NMT 5%, *System suitability solution 1*

### Analysis

[NOTE—Run the *Sample solution* at least 1.5 times the retention time of carmustine.]

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of carmustine related compound A in the portion of Carmustine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of carmustine related compound A from the *Sample solution*  
 $r_S$  = peak response of carmustine related compound A from the *Standard solution*  
 $C_S$  = concentration of carmustine related compound A in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Carmustine in the *Sample solution* (mg/mL)

Calculate the percentage of each unspecified impurity in the portion of Carmustine taken:

$$\text{Result} = (r_U/r_T) \times 100$$

- $r_U$  = peak response of any unspecified impurity from the *Sample solution*  
 $r_T$  = sum of all peak responses from the *Sample solution*

#### Acceptance criteria

Carmustine related compound A: NMT 0.5%

Any unspecified impurity: NMT 0.1%

#### • PROCEDURE 3: LIMIT OF 2-CHLOROETHYLAMINE

[NOTE— Prepare solutions in low-actinic glassware, and keep them refrigerated until use.]

**Standard solution 1 (0.2%):** 1.2 mg/mL of 2-chloroethylamine monohydrochloride in methanol. [NOTE— 1.2 mg/mL of 2-chloroethylamine monohydrochloride is equivalent to 0.8 mg/mL of 2-chloroethylamine.]

**Standard solution 2 (0.1%):** 0.4 mg/mL of USP Carmustine RS in methanol

**Sample solution:** 0.4 g/mL of Carmustine in methanol

#### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic plate (20-cm × 20-cm) coated with silica gel 60

**Application volume:** 1 µL

**Developing solvent system 1:** Ethyl acetate

**Developing solvent system 2:** Ethyl acetate and methanol (7:3)

**Spray reagent 1:** Diethylamine

**Spray reagent 2:** 0.1 N silver nitrate solution

#### Analysis

**Samples:** *Standard solution 1* (0.2%), *Standard solution 2* (0.1%), and *Sample solution*

Develop with *Developing solvent system 1* for 27 min, followed by air drying for 5 min. Develop again in *Developing solvent system 2* for 8 min, followed by air drying for 10 min. Spray the plate with *Spray reagent 1*, and heat the plate for 20 min in an oven at 100°. Allow the plates to cool to room temperature, and spray the plate with *Spray reagent 2*. Allow the plate to be exposed to UV light at 365 nm for 15 min. Examine the plate under UV light.

#### Acceptance criteria

**2-Chloroethylamine:** The spot for 2-chloroethylamine from the *Sample solution* is not more intense than the principal spot from *Standard solution 1* (0.2%).

**Any unspecified impurity:** Any spot if present in the chromatogram from the *Sample solution*, except the principal spot of carmustine and the spot of 2-chloroethylamine, is not more intense than the principal spot from *Standard solution 2* (0.1%).

#### • PROCEDURE 4: LIMIT OF 2-CHLOROETHANOL

**Standard solution:** 0.02 mg/mL of 2-chloroethanol in acetonitrile

**System suitability solution:** 0.01 mg/mL of 2-chloroethanol in acetonitrile, diluted from the *Standard solution*

**Sample solution:** 10 mg/mL of Carmustine in acetonitrile. [NOTE—Prepare in low-actinic glassware, and keep refrigerated until use.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 30-m × 0.53-mm column bonded with a 1-µm film of phase G16

**Temperature**

**Injector:** 90°

**Detector:** 260°

**Column:** See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	6
40	30	80	14
80	30	200	3

**Carrier gas:** Helium

**Flow rate:** 7 mL/min

**Injection size:** 5 µL

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Relative standard deviation:** NMT 5%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of 2-chloroethanol in the portion of Carmustine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of 2-chloroethanol from the *Sample solution*

$r_S$  = peak response of 2-chloroethanol from the *Standard solution*

$C_S$  = concentration of 2-chloroethanol in the *Standard solution* (mg/mL)

$C_U$  = concentration of Carmustine in the *Sample solution* (mg/mL)

#### Acceptance criteria

**2-Chloroethanol:** NMT 0.1%

#### • PROCEDURE 5: LIMIT OF ACETALDEHYDE

**Standard solution:** 10 µg/mL of acetaldehyde in acetonitrile

**Sample solution:** 10 mg/mL of Carmustine in acetonitrile. [NOTE—Prepare in low-actinic glassware, and keep refrigerated until use.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 30-m × 0.53-mm column bonded with a 5-µm film of phase G1

**Temperature**

**Injector:** 70°

**Detector:** 260°

**Column:** See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	6
40	30	210	3

**Injector split ratio:** 15:1

**Carrier gas:** Helium

**Flow rate:** 3 mL/min

**Injection size:** 5 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 5%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of acetaldehyde in the portion of Carmustine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of acetaldehyde from the *Sample solution*

$r_S$  = peak response of acetaldehyde from the *Standard solution*

$C_S$  = concentration of acetaldehyde in the *Standard solution* (mg/mL)

$C_U$  = concentration of Carmustine in the *Sample solution* (mg/mL)

**Acceptance criteria**

**Acetaldehyde:** NMT 0.1%

**SPECIFIC TESTS**

- **WATER DETERMINATION, Method I (921):** NMT 0.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers at a temperature between 2° and 8°.
- **USP REFERENCE STANDARDS (11)**  
USP Carmustine RS  
USP Carmustine Related Compound A RS  
1,3-Bis(2-chloroethyl) urea.  
 $C_5H_{10}Cl_2N_2O$  185.05

## Carmustine for Injection

**DEFINITION**

Carmustine for Injection is a sterile lyophilized preparation of carmustine. It contains NLT 90.0% and NMT 110.0% of the labeled amount of carmustine ( $C_5H_9Cl_2N_3O_2$ ).

**[CAUTION]**—Use appropriate surgical gloves, arm covers, and a dust mask. Perform all work under a fume hood approved for testing cytotoxic agents when possible.]

**IDENTIFICATION**

- **A. INFRARED ABSORPTION (197F)**

**Sample:** Melt a small portion of the sample in a suitable container in a controlled water bath or oven, and set the temperature between 33° and 40°.

**Standard:** A similar preparation of USP Carmustine RS

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

- **PROCEDURE**

[NOTE—Prepare solutions in low-actinic glassware, and keep them refrigerated until use.]

**Mobile phase:** See the gradient table below.

Time (min)	Water (%)	Acetonitrile (%)
0	90	10
2.5	90	10
7	40	60
8.5	90	10
10.5	90	10

**Diluent:** Acetonitrile and water (1:3)

**Standard stock solution:** 2.0 mg/mL of USP Carmustine RS in acetonitrile

**Standard solution:** 0.2 mg/mL of USP Carmustine RS in *Diluent*, from *Standard stock solution*

**Impurity standard stock solution:** 0.1 mg/mL of USP Carmustine Related Compound A RS in acetonitrile

**System suitability solution:** 0.2 mg/mL of USP Carmustine RS and 0.002 mg/mL of USP Carmustine Related Compound A RS in *Diluent*, from the *Standard stock solution* and *Impurity standard stock solution*, respectively

**Sample stock solution:** 2.0 mg/mL of carmustine in acetonitrile, from Carmustine for Injection. [NOTE—Allow test vials to warm to room temperature in a desiccator for 1 h.]

**Sample solution:** 0.2 mg/mL of carmustine in *Diluent*, from the *Sample stock solution*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 200 nm

**Refrigerated autosampler temperature:** 5°

**Column:** 4.6-mm × 7.5-cm; 3-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 20 µL

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times for carmustine related compound A and carmustine are 0.5 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.0 between carmustine related compound A and carmustine

**Tailing factor:** NMT 1.5 for the carmustine related compound A and carmustine peaks

**Relative standard deviation:** NMT 2.0% for the carmustine related compound A and carmustine peaks

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of carmustine ( $C_5H_9Cl_2N_3O_2$ ) in the portion of Carmustine for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of the *Sample solution*

$r_S$  = peak area of the *Standard solution*

$C_S$  = concentration of carmustine in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of carmustine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

**IMPURITIES**

**Organic Impurities**

- **PROCEDURE: LIMIT OF CARMUSTINE RELATED COMPOUND A**

**Diluent, Impurity standard stock solution, System suitability solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Standard solution:** 0.002 mg/mL of USP Carmustine Related Compound A RS in *Diluent*, from the *Impurity standard stock solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of carmustine related compound A in the portion of Carmustine for Injection taken:

$$\text{Result} = (r_U/r_S) \times [100 \times C_S/(C_U \times A)] \times 100$$

- $r_U$  = peak response of carmustine related compound A from the *Sample solution*  
 $r_S$  = peak response of carmustine related compound A from the *Standard solution*  
 $C_S$  = concentration of carmustine related compound A in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of carmustine in the *Sample solution* (mg/mL)  
 A = assay of Carmustine for Injection, as a percentage

**Acceptance criteria**

Carmustine related compound A: NMT 1.0%

**SPECIFIC TESTS**

- **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.95 USP Endotoxin Unit/mg of carmustine
- **STERILITY TESTS (71):** Meets the requirements
- **PH (791):** Between 4.0 and 6.8 in a constituted solution prepared as directed in the labeling
- **WATER DETERMINATION, Method I (921):** NMT 1.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve as described in *Injections (1)*, *Containers for Sterile Solids* at a temperature between 2° and 8°.
- **LABELING:** It meets the requirements in *Injections (1)*, *Labeling*.
- **CONSTITUTED SOLUTION:** At time of use, it meets the requirements in *Injections (1)*, *Constituted Solutions*.
- **USP REFERENCE STANDARDS (11)**

## Carprofen

$C_{15}H_{12}ClNO_2$  273.71  
 9*H*-Carbazole-2-acetic acid, 6-chloro- $\alpha$ -methyl-, ( $\pm$ )-.  
 ( $\pm$ )-6-Chloro- $\alpha$ -methylcarbazole-2-acetic acid  
 [53716-49-7].

» Carprofen contains not less than 98.0 percent and not more than 102.0 percent of  $C_{15}H_{12}ClNO_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Label it to indicate that it is intended for veterinary use only.

**USP Reference standards (11)**—

USP Carprofen RS  
 USP Carprofen Related Compound A RS  
 Carbazole.  
 $C_{12}H_9N$  167.21

**Identification—**

**A:** *Infrared Absorption (197K).*

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Loss on drying (731)**—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition (281):** not more than 0.1%.

**Heavy metals, Method II (231):** 0.002%.

**Limit of acetone and methylene chloride—**

**Standard solution**—Transfer about 5.0 g of acetone and 0.6 g of methylene chloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *N,N*-dimethylacetamide to volume, and mix. Pipet 1 mL of this solution into a 100-mL volumetric flask, dissolve in and dilute with *N,N*-dimethylacetamide to volume, and mix.

**Test solution**—Transfer about 500 mg of Carprofen, accurately weighed, to a 5-mL volumetric flask, dissolve in and dilute with *N,N*-dimethylacetamide to volume, and mix.

**Chromatographic system** (see *Chromatography (621)*)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm  $\times$  30-m capillary column coated with 3.0- $\mu$ m G43 stationary phase. The carrier gas is nitrogen, flowing at a rate of about 4.9 mL per minute. The split flow ratio is about 10:1. Initially the column temperature is maintained at 80° for 4 minutes, then is increased at a rate of 30° per minute to a temperature of 190°, and maintained at 190° for at least 3 minutes. The injection port temperature is maintained at 210°, and the detector temperature is maintained at 220°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: acetone elutes before methylene chloride; the resolution, *R*, between them is not less than 1.5; and the relative standard deviation for replicate injections, determined from the peak responses of acetone, is not more than 10.0%.

**Procedure**—Separately inject equal volumes (about 1  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of each residual solvent in the portion of Carprofen taken by the formula:

$$0.5(C_S / W)(r_U / r_S)$$

in which  $C_S$  is the concentration, in  $\mu$ g per mL, of the individual residual solvent in the *Standard solution*; *W* is the weight, in mg, of Carprofen taken to prepare the *Test solution*;  $r_U$  is the peak response of the individual residual solvent in the *Test solution*; and  $r_S$  is the peak response of the individual residual solvent in the *Standard solution*: not more than 5000 ppm of acetone is found; and not more than 600 ppm of methylene chloride is found.

**Related compounds—**

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay*.

**Test solution**—Use the *Assay preparation*.

**Procedure**—Inject about 10  $\mu$ L of the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for all the peaks. Calculate the percentage of each related compound in the portion of Carprofen taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the response of each individual peak other than the major peak of carprofen; and  $r_s$  is the sum of the peak responses: not more than 0.5% of each individual known related compound is found (see the relative retention times of these compounds in the table below); not more than 0.1% of each individual unknown related compound is found; and not more than 1.0% of total related compounds is found.

Known Related Compound	Approximate Relative Retention Time
Carprofen related compound A (carbazole)	0.9
2-[1,1-Dimethoxy-2-hydroxypropyl]-6-chlorocarbazole	1.3
2-[2-Chloropropionyl]-6-chloro-9-acetylcabazole	3.3

**Assay—**

*Mobile phase*—Prepare a mixture of acetonitrile, water, methanol, and glacial acetic acid (40:35:25:0.2).

*Carprofen related compound A solution*—[NOTE—Use low-actinic glassware.] Prepare a solution of USP Carprofen Related Compound A RS, accurately weighed, in *Mobile phase*, containing about 16 µg per mL, sonicating if necessary.

*Standard preparation*—[NOTE—Use low-actinic glassware.] Prepare a solution of USP Carprofen RS, accurately weighed, in *Mobile phase*, containing about 160 µg per mL, sonicating if necessary.

*System suitability solution*—[NOTE—Use low-actinic glassware.] Transfer 10 mL of *Carprofen related compound A solution* and 10 mL of *Standard preparation* into a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

*Assay preparation*—[NOTE—Use low-actinic glassware.] Dissolve an accurately weighed quantity of Carprofen in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 160 µg per mL.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 239-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between carprofen and carprofen related compound A is not less than 2.0; the column efficiency for the carprofen peak is not less than 5000 theoretical plates; the tailing factor for the carprofen peak is not more than 2.0; and the relative standard deviation for replicate injections of carprofen is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the percentage of  $C_{15}H_{12}ClNO_2$  in the portion of Carprofen taken by the formula:

$$100P(C_S / C_U)(R_U / R_S)$$

in which  $P$  is the purity, in µg per mg, of USP Carprofen RS;  $C_S$  and  $C_U$  are the concentrations, in µg per mL, of the *Standard preparation* and the *Assay preparation*, respectively; and  $R_U$  and  $R_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Carprofen Tablets**

» Carprofen Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of carprofen ( $C_{15}H_{12}ClNO_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Carprofen RS

**Identification—**

**A:** *Infrared Absorption* <197K>—

*Reference specimen*—Mix about 2 mg of USP Carprofen RS with 200 mg of potassium bromide, and grind thoroughly for 10 to 15 minutes. Compress the mixture into a clear pellet. Record the IR spectrum of the pellet immediately after preparation.

*Test specimen*—Grind into powder not fewer than 4 Tablets. Transfer the powder, equivalent to about 100 mg of carprofen, to a 125-mL separatory funnel. Add 30 mL of water and 3 drops of hydrochloric acid, and shake for about 5 minutes. Add about 30 mL of methylene chloride, and shake for another 5 minutes. Allow the phases to separate. Carefully drain and collect the lower methylene chloride layer through anhydrous sodium sulfate that is placed on a cotton pledget into a suitable container. Evaporate the methylene chloride on a steam bath with the aid of a stream of nitrogen to dryness. Dry the residue in vacuum at 60° for about 30 minutes. Mix about 2 mg of the dried residue with 200 mg of potassium bromide, and grind thoroughly for 10 to 15 minutes. Compress the mixture into a clear pellet. Record the IR spectrum of the carprofen sample pellet immediately after preparation.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

**Dissolution** <711>—[NOTE—Use low-actinic volumetric flasks, dissolution vessels, and evaporation covers.]

*Medium*: 0.05 M phosphate buffer, pH 7.5 (prepared by dissolving 6.8 g of monobasic potassium phosphate in 600 mL of water, mixing, adding 18 mL of 2 N sodium hydroxide, mixing, diluting with water to 1000 mL, and adjusting with 0.2 N sodium hydroxide or 0.2 N hydrochloric acid to a pH of  $7.50 \pm 0.05$ ); 900 mL, degassed.

*Apparatus 2*: 50 rpm.

*Time*: 30 minutes.

Determine the amount of  $C_{15}H_{12}ClNO_2$  dissolved by employing the following method.

*Standard solution*—

FOR TABLETS LABELED TO CONTAIN 25 MG—Transfer about 25 mg of USP Carprofen RS, accurately weighed, to a 900-mL volumetric flask. Slowly add 10 mL of methanol. Dilute with *Medium* to volume, and mix.

FOR TABLETS LABELED TO CONTAIN 75 MG—Transfer about 75 mg of USP Carprofen RS, accurately weighed, to a 900-mL volumetric flask. Slowly add 30 mL of methanol. Dilute with *Medium* to volume, and mix.

FOR TABLETS LABELED TO CONTAIN 100 MG—Transfer about 100 mg of USP Carprofen RS, accurately weighed, to a 900-mL volumetric flask. Slowly add 40 mL of methanol. Dilute with *Medium* to volume, and mix.

*Test solution*—Pass a portion of the solution under test through a suitable 0.45-µm filter.

*System suitability solution*—Determine the absorbance of the *Standard solution*, as directed for *Procedure*, five times: the relative standard deviation is not more than 2.0%.

*Procedure*—Determine the amount of  $C_{15}H_{12}ClNO_2$  dissolved by measuring the absorbance of the *Test solution* in comparison with the appropriate *Standard solution* at the wavelength of maximum absorbance at about 300 nm, using a 0.5-cm cell for Tablets labeled to contain 25 mg, a 0.2-cm cell for Tablets labeled to contain 75 mg, and a 0.1-cm cell for Tablets labeled to contain 100 mg. Use *Medium* as the blank. Calculate the percentage of  $C_{15}H_{12}ClNO_2$  dissolved by the formula:

$$\frac{A_U \times W_S \times 100}{A_S \times LC}$$

in which  $A_U$  and  $A_S$  are the absorbances obtained from the *Test solution* and the *Standard solution*, respectively;  $W_S$  is the weight, in mg, of USP Carprofen RS used to prepare the *Standard solution*; 100 is the conversion factor to percentage; and  $LC$  is the Tablet label claim, in mg.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{15}H_{12}ClNO_2$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Content Uniformity*.

PROCEDURE FOR CONTENT UNIFORMITY—[NOTE—Use low-actinic glassware.]

**Mobile phase and Chromatographic system**—Prepare as directed in the *Assay*.

**Standard solution**—Prepare as directed for the *Standard preparation* in the *Assay*.

**Test solution**—Transfer 10 Tablets individually to 10 separate volumetric flasks of a suitable calibrated volume such that an interim concentration of 0.5 mg per mL of *Mobile phase* can be prepared. To each flask, add *Mobile phase* to 80% of the calibrated volume, sonicate for 10 minutes, then stir for 10 minutes. Sonicate again for 10 minutes, and stir for another 10 minutes or until the Tablets are completely disintegrated. Cool to room temperature, dilute with *Mobile phase* to volume to obtain an interim concentration of 0.5 mg of carprofen per mL, and mix. Quantitatively transfer 5.0 mL of the individual solutions to 10 separate 50.0-mL volumetric flasks, dilute with *Mobile phase* to volume, and mix. Pass the solution through a polyvinylidene fluoride (PVDF) filter having a 0.45- $\mu$ m or finer porosity, discarding the first 5 mL of the filtrate. The final concentration is about 0.05 mg of carprofen per mL.

**Procedure**—Proceed as directed for *Procedure* in the *Assay*. Calculate the percentage of the labeled content of  $C_{15}H_{12}ClNO_2$  in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which the terms are as defined therein.

#### Chromatographic purity—

**Mobile phase**—Proceed as directed in the *Assay*.

**Standard solution**—[NOTE—Use low-actinic glassware.] Dissolve an accurately weighed quantity of USP Carprofen RS in *Mobile phase* to obtain a solution having a known concentration of 0.05  $\mu$ g of carprofen per mL.

**Sensitivity solution**—[NOTE—Use low-actinic glassware.] Quantitatively dilute the *Standard solution* with *Mobile phase* to obtain a solution containing about 0.005  $\mu$ g of carprofen per mL.

**Test solution**—Use the *Assay preparation*.

**Blank solution**—Transfer an accurately weighed portion of the Tablet base, equivalent to the weight of 1 Tablet, to a volumetric flask of the same calibrated volume as that used to prepare the *Test solution*. To each flask add *Mobile phase* to 80% of the calibrated volume. Sonicate for 10 minutes, then stir for 10 minutes. Sonicate again for 10 minutes, and stir for another 10 minutes. Cool to room temperature, dilute with *Mobile phase* to volume, and mix. Quantitatively transfer 5.0 mL of the solution to a 50.0-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass the solution through a PVDF filter having a 0.45- $\mu$ m or finer porosity, discarding the first 5 mL of the filtrate.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L7. The flow rate is about 1.0 mL per minute. Wash the column after each series of analyses with a mixture of acetonitrile and water (20:80) for 30 minutes; gradually change the composition of acetonitrile and water to 80:20 over 10 minutes; continue to wash at 80:20 for 30 minutes; gradually change the composition to 50:50 over 10 minutes; and continue to wash at 50:50 for another 30 minutes. Chromatograph the *Standard solution*, the *Sensitivity solution*, and

the *Test solution*, and record the peak responses as directed for *Procedure*: for the *Standard solution*, the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%; for the *Sensitivity solution*, the carprofen peak should be defined and integratable; for the *Test solution*, the resolution,  $R$ , between carprofen and the nearest impurity peak is not less than 2.0. After every six injections of any solution, inject a *Standard solution* in duplicate. The ratio of the average response of the duplicate injections to that obtained from the initial five replicate injections is 0.95 to 1.05.

**Procedure**—Inject a volume (about 50  $\mu$ L) of the *Standard solution*, the *Test solution*, and the *Blank solution* into the chromatograph, record the chromatograms, and measure all the peak areas. Calculate the percentage of carprofen-related compounds in the portion of Tablets taken by the formula:

$$0.1(C_S / C_U)(r_i / r_S)$$

in which  $C_S$  is the concentration, in  $\mu$ g per mL, of carprofen in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of carprofen in the *Test solution*;  $r_i$  is the peak area of any peak other than carprofen obtained from the *Test solution*; and  $r_S$  is the peak area of carprofen obtained from the *Standard solution*: not more than 0.5% of any single impurity is found; and the sum of all impurities is not more than 2.0%. Disregard any peak also observed in the *Blank solution*.

#### Assay—

**Mobile phase**—Mix 500 mL of acetonitrile, 500 mL of water, and 1 mL of phosphoric acid. Degas before using. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—[NOTE—Use low-actinic glassware.] Dissolve an accurately weighed quantity of USP Carprofen RS in *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

**Assay preparation**—[NOTE—Use low-actinic glassware.] Accurately weigh 20 Tablets, and calculate the average Tablet weight. Grind the Tablets into uniform powder. Transfer three accurately weighed portions of the powder, each equivalent to the weight of one Tablet, into three volumetric flasks of a suitable calibrated volume such that an interim concentration of 0.5 mg per mL of *Mobile phase* can be prepared. To each flask add *Mobile phase* to 80% of the calibrated volume, sonicate for 10 minutes, then stir for 10 minutes. Sonicate again for 10 minutes, and stir for another 10 minutes. Cool to room temperature, dilute with *Mobile phase* to volume to obtain an interim concentration of 0.5 mg of carprofen per mL, and mix. Quantitatively transfer 5.0 mL of the solution to a 50.0-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass the solution through a PVDF filter having a 0.45- $\mu$ m or finer porosity, discarding the first 5 mL of the filtrate. The final concentration is about 0.05 mg of carprofen per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. Wash the column after each series of analyses with a mixture of acetonitrile and water (20:80) for 30 minutes; gradually change the composition of acetonitrile and water to 80:20 over 10 minutes; continue to wash at 80:20 for 30 minutes; gradually change the composition to 50:50 over 10 minutes; and continue to wash at 50:50 for another 30 minutes. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the column efficiency for carprofen is not less than 4000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for five replicate injections is not more than 2.0%. Inject the *Standard preparation* in duplicate after every 12 injections or

fewer of any other solution. The ratio of the average area of the duplicate injections to that obtained from the initial five replicate injections is 0.95 to 1.05.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of the labeled content of carprofen ( $C_{15}H_{12}ClNO_2$ ) in the portion of Tablets taken by the formula:

$$100(C_s / C_U)(r_U / r_s)$$

in which  $C_s$  and  $C_U$  are the concentrations, in mg per mL, of USP Carprofen RS in the *Standard preparation* and carprofen in the *Assay preparation*, respectively; and  $r_U$  and  $r_s$  are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Carteolol Hydrochloride

$C_{16}H_{24}N_2O_3 \cdot HCl$  328.83

2-(1*H*)-Quinolinone, 5-[3-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy]-3,4-dihydro-, monohydrochloride.  
5-[3-(*tert*-Butylamino)-2-hydroxypropoxy]-3,4-dihydrocarbo-  
styryl monohydrochloride [51781-21-6].

» Carteolol Hydrochloride contains not less than 98.0 percent and not more than 101.5 percent of  $C_{16}H_{24}N_2O_3 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Carteolol Hydrochloride RS

**Identification**—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 10  $\mu$ g per mL.

*Medium:* water.

**C:** A solution (1 in 50) responds to the tests for *Chloride* (191).

**pH** (791): between 5.0 and 6.0, in a solution (1 in 100).

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method I** (231): not more than 0.002%.

**Arsenic, Method II** (211): 3 ppm.

**Chromatographic purity**—

*Standard solution A*—Prepare a solution of USP Carteolol Hydrochloride RS in methanol containing 0.5 mg per mL.

*Standard solution B*—Transfer 5.0 mL of *Standard solution A* to a 50-mL volumetric flask, dilute with methanol to volume, and mix.

*Standard solution C*—Transfer 5.0 mL of *Standard solution B* to a 10-mL volumetric flask, dilute with methanol to volume, and mix.

*Test solution*—Transfer 250 mg of Carteolol Hydrochloride to a 10-mL volumetric flask, dissolve in methanol, using heat or sonication if necessary to achieve dissolution, dilute with methanol to volume, and mix.

**Procedure**—Apply separate 10- $\mu$ L portions of the *Test solution* and the *Standard solutions* to the starting line of a thin-

layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry. Line a chromatographic chamber with filter paper, and saturate the paper with a solvent system consisting of a mixture of chloroform, methanol, and ammonium hydroxide (50:20:1). Place the plate in the chamber, and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and allow to air-dry. Examine the plate under short-wavelength UV light: the  $R_f$  value of the principal spot in the chromatogram obtained from the *Test solution* corresponds to that in the chromatogram obtained from *Standard solution A*. Compare the sizes and intensities of any spots other than the principal spot in the chromatogram obtained from the *Test solution* with those of the principal spots in the chromatograms obtained from the *Standard solutions*: no spot exceeds in size or intensity the principal spot in the chromatogram obtained from *Standard solution B* (0.2%), and the sum of all the impurity spots does not exceed 0.5%.

**Assay**—

**pH 6.0 Buffer**—Dissolve 1.34 g of dibasic sodium phosphate in about 1900 mL of water, adjust with 1 M phosphoric acid to a pH of  $6.0 \pm 0.05$ , dilute with water to 2000 mL and mix.

**Mobile phase**—Prepare a mixture of *pH 6.0 Buffer* and acetonitrile (750:250). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). [NOTE—Increasing the proportion of *pH 6.0 Buffer* increases resolution.]

**Diluent**—Prepare a mixture of *pH 6.0 Buffer* and methanol (1:1).

**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Carteolol Hydrochloride RS in water to obtain a solution having a known concentration of about 1 mg per mL. Transfer 10.0 mL of this stock solution to a 100-mL volumetric flask containing 5 mL of acetonitrile, dilute with water to volume, and mix. This solution contains about 0.1 mg of USP Carteolol Hydrochloride RS per mL.

**Resolution solution**—Transfer about 50 mg of *p*-acetotoluidide to a 100-mL volumetric flask, add 50 mL of acetonitrile, and swirl to dissolve. Dilute with water to volume, and mix. Transfer 10 mL of this solution and 10 mL of the stock solution used to prepare the *Standard preparation* to a second 100-mL volumetric flask, dilute with water to volume, and mix. Each mL of this solution contains about 0.05 mg of *p*-acetotoluidide and 0.1 mg of USP Carteolol Hydrochloride RS.

**Assay preparation**—Transfer about 100 mg of Carteolol Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask containing 5 mL of acetonitrile, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 252-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.8 for carteolol and 1.0 for *p*-acetotoluidide; and the resolution,  $R$ , between the carteolol peak and the *p*-acetotoluidide peak is not less than 3. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in

mg, of  $C_{16}H_{24}N_2O_3 \cdot HCl$  in the portion of Carteolol Hydrochloride taken by the formula:

$$1000C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Carteolol Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the carteolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Carteolol Hydrochloride Ophthalmic Solution

» Carteolol Hydrochloride Ophthalmic Solution is a sterile, aqueous, isotonic solution of Carteolol Hydrochloride. It contains a suitable antimicrobial preservative. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{16}H_{24}N_2O_3 \cdot HCl$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Carteolol Hydrochloride RS

**Identification**—

**A:** Prepare a test solution by diluting a suitable volume of Ophthalmic Solution with water, if necessary, to obtain a solution containing about 1 mg of carteolol hydrochloride per mL. Separately apply 10  $\mu$ L of the test solution and 10  $\mu$ L of a Standard solution of USP Carteolol Hydrochloride RS in water containing about 1 mg per mL to the starting line of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry. Line a chromatographic chamber with filter paper, and saturate the paper with a solvent system consisting of a mixture of chloroform, methanol, and ammonium hydroxide (50:20:1). Place the plate in the chamber, and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and allow to air-dry. Examine the plate under short-wave-length UV light: the  $R_f$  value of the principal spot in the chromatogram obtained from the test solution corresponds to that in the chromatogram obtained from the Standard solution.

**B:** The retention time of the carteolol peak in the chromatogram of the *Assay preparation* obtained as directed in the *Assay* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 6.0 and 8.0.

**Assay**—

*pH 6.0 buffer, Mobile phase, Diluent, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Carteolol Hydrochloride*.

*Assay preparation*—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 10 mg of carteolol hydrochloride, to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pass a portion of this solution through a filter having a porosity of 0.5  $\mu$ m or finer, discarding the first 2 mL of the filtrate, and use the filtrate as the *Assay preparation*.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in

mg, of  $C_{16}H_{24}N_2O_3 \cdot HCl$  in each mL of the Ophthalmic Solution taken by the formula:

$$100(C / V)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Carteolol Hydrochloride RS in the *Standard preparation*;  $V$  is the volume, in mL, of Ophthalmic Solution taken; and  $r_U$  and  $r_S$  are the carteolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Carteolol Hydrochloride Tablets

» Carteolol Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{16}H_{24}N_2O_3 \cdot HCl$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Carteolol Hydrochloride RS

USP Dehydrocarteolol Hydrochloride RS

5-(3-*tert*-Butylamino-2-hydroxy)-propoxycarbostyryl hydrochloride.

$C_{16}H_{22}N_2O_3 \cdot HCl$  326.82

**Identification**—The retention time of the carteolol peak in the chromatogram of the *Assay preparation* obtained as directed in the *Assay* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

*Mobile phase*—Dissolve 2.0 g of monobasic potassium phosphate in water to make 1000 mL of solution. Prepare a mixture of this solution and acetonitrile (600:400). Degas and pass through a filter having a porosity of 0.5  $\mu$ m or finer. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Prepare a solution of USP Carteolol Hydrochloride RS in water having a known concentration of about 1.1L  $\mu$ g per mL,  $L$  being the labeled amount, in mg, of carteolol hydrochloride per Tablet.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 252-nm detector and a 3.9-mm  $\times$  30-cm column containing packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2%.

*Procedure*—Pass a portion of the solution under test through a filter having a porosity of 1  $\mu$ m or finer, discarding the first 2 mL of the filtrate. Separately inject equal volumes (about 15  $\mu$ L) of the *Standard solution* and the test solution into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of  $C_{16}H_{24}N_2O_3 \cdot HCl$  dissolved by the formula:

$$0.9C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Carteolol Hydrochloride RS in the *Standard solution*, and  $r_U$  and  $r_S$  are the carteolol peak responses obtained from the test solution and the *Standard solution*, respectively.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_{16}H_{24}N_2O_3 \cdot HCl$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Limit of dehydrocarteolol hydrochloride—**

*pH 6.0 buffer, Mobile phase, and Diluent*—Proceed as directed in the Assay under *Carteolol Hydrochloride*.

*Standard solution*—Dissolve an accurately weighed quantity of USP Dehydrocarteolol Hydrochloride RS quantitatively in *Diluent* to obtain a solution having a known concentration of about 1 µg per mL.

*Test solution*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of carteolol hydrochloride, to a 100-mL volumetric flask, add about 50 mL of *Diluent*, and shake by mechanical means for 1 hour. Dilute with *Diluent* to volume, and mix. Pass about 5 mL of this solution through a filter having a 0.5-µm or finer porosity.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a fluorometric detector, with excitation at 300 nm and a 418-nm emission filter, and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5%.

*Procedure*—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the dehydrocarteolol peak responses. Calculate the percentage of dehydrocarteolol hydrochloride in the portion of Tablets taken by the formula:

$$10(C/L)(W_A/W_T)(r_{ud}/r_{sd})$$

in which *C* is the concentration, in µg per mL, of USP Dehydrocarteolol Hydrochloride RS in the *Standard solution*; *L* is the labeled amount, in mg, of carteolol hydrochloride in each Tablet; *W<sub>A</sub>* is the average weight, in mg, of each Tablet; *W<sub>T</sub>* is the quantity, in mg, of the portion of Tablets taken to prepare the *Test solution*; and *r<sub>ud</sub>* and *r<sub>sd</sub>* are the dehydrocarteolol peak responses obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 1.0% is found.

**Assay—**

*pH 6.0 buffer, Mobile phase, Diluent, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the Assay under *Carteolol Hydrochloride*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of carteolol hydrochloride, to a 100-mL volumetric flask. Add about 50 mL of *Diluent*, and shake by mechanical means for 1 hour. Add 5 mL of acetonitrile, dilute with *Diluent* to volume, and mix. Pass a portion of this solution through a filter having a 0.5-µm or finer porosity, discarding the first 2 mL of filtrate, and use the clear filtrate as the *Assay preparation*.

*Procedure*—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>16</sub>H<sub>24</sub>N<sub>2</sub>O<sub>3</sub> · HCl in the portion of Tablets taken by the formula:

$$100C(r_u/r_s)$$

in which *C* is the concentration, in mg per mL, of USP Carteolol Hydrochloride RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the carteolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Carvedilol**C<sub>24</sub>H<sub>26</sub>N<sub>2</sub>O<sub>4</sub>

406.47

2-Propanol, 1-(9H-carbazol-4-yloxy)-3-[[2-(2-methoxyphenoxy)ethyl]amino]-, (±)-; (±)-1-(Carbazol-4-yloxy)-3-[[2-(o-methoxyphenoxy)ethyl]amino]-2-propanol [72956-09-3].

**DEFINITION**

Carvedilol contains NLT 98.0% and NMT 102.0% of C<sub>24</sub>H<sub>26</sub>N<sub>2</sub>O<sub>4</sub>, calculated on the dried basis.

**IDENTIFICATION**

- A. INFRARED ABSORPTION** <197K>
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY****PROCEDURE**

**Buffer:** 2.72 g/L of monobasic potassium phosphate. Adjust with dilute phosphoric acid to a pH of 2.0.

**Mobile phase:** Acetonitrile and *Buffer* (31:69)

**System suitability solution:** 0.05 mg/mL each of USP Carvedilol RS and USP Carvedilol Related Compound A RS in *Mobile phase*

**Standard solution:** 0.04 mg/mL of USP Carvedilol RS in *Mobile phase*

**Sample solution:** 0.04 mg/mL of Carvedilol in *Mobile phase*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L7

**Column temperature:** 55°

**Flow rate:** 1 mL/min

**Run time:** 60 min

**Injection size:** 10 µL

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 4.0 between carvedilol and carvedilol related compound A

**Tailing factor:** NMT 1.5 for the carvedilol peak

**Relative standard deviation:** NMT 2%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of carvedilol (C<sub>24</sub>H<sub>26</sub>N<sub>2</sub>O<sub>4</sub>) in the portion of the sample taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

*r<sub>u</sub>* = peak response of carvedilol from the *Sample solution*

*r<sub>s</sub>* = peak response of carvedilol from the *Standard solution*

*C<sub>s</sub>* = concentration of carvedilol in the *Standard solution* (mg/mL)

*C<sub>u</sub>* = concentration of Carvedilol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES**

• **RESIDUE ON IGNITION** <281>: NMT 0.1% from 1 g

• **HEAVY METALS, Method II** <231>: NMT 10 ppm

• **ORGANIC IMPURITIES, PROCEDURE 1:** [NOTE—On the basis of the impurities present, perform either *Organic Impuri-*

ties, Procedure 1 or Organic Impurities, Procedure 2. Organic Impurities, Procedure 2 is recommended when carvedilol related compound F is a potential impurity.]  
**Buffer and Mobile phase:** Prepare as directed in the Assay.

**System suitability solution:** 0.05 mg/mL each of USP Carvedilol RS and USP Carvedilol Related Compound C RS in *Mobile phase*

**Standard solution:** 1 µg/mL each of USP Carvedilol RS, USP Carvedilol Related Compound A RS, USP Carvedilol Related Compound B RS, USP Carvedilol Related Compound D RS, and USP Carvedilol Related Compound E RS, and 0.2 µg/mL of USP Carvedilol Related Compound C RS in *Mobile phase*

**Sample solution:** 1 mg/mL of Carvedilol in *Mobile phase*

**Chromatographic system**  
 (See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** Dual wavelength, UV 220 and 240 nm. Use 220 nm for quantitating carvedilol related compound E, and use 240 nm for carvedilol and all other related compounds.

**Column:** 4.6-mm × 15-cm; 5-µm packing L7

**Column temperature:** 55°

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

**System suitability**

**Sample:** System suitability solution

**Suitability requirements**

**Resolution:** NLT 17 between carvedilol and carvedilol related compound C

**Analysis**

**Samples:** Standard solution and Sample solution

Calculate the percentage of carvedilol related compound A, carvedilol related compound B, carvedilol related compound C, carvedilol related compound D, carvedilol related compound E, and any other individual impurity in the portion of Carvedilol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the corresponding related compound or any other impurity from the *Sample solution*

$r_S$  = peak response of the corresponding related compound from the *Standard solution*. To calculate the percentage of any other individual impurity use the peak response of carvedilol.

$C_S$  = concentration of the corresponding related compound in the *Standard solution* (mg/mL). To calculate the percentage of any other impurities for  $C_S$ , use the concentration of USP Carvedilol RS.

$C_U$  = concentration of Carvedilol in the *Sample solution* (mg/mL)

**Acceptance criteria:** See Table 1.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

<sup>d</sup> 1-(H-Carbazol-4-yloxy)-3-[[2-(2-methoxyphenoxy)ethyl]N-isopropylamino]-2-propanol.

<sup>e</sup> 1-(9H-Carbazol-4-yloxy)-3-(benzyl(2-(2-methoxyphenoxy)ethyl)amino)propan-2-ol.

<sup>f</sup> 3,3'-(2-(2-Methoxyphenoxy)ethylazanediyl)bis(1-(9H-carbazol-4-yloxy)propan-2-ol).

<sup>g</sup> 1,3-Bis-(9H-carbazol-4-yloxy)-2-propanol.

• **ORGANIC IMPURITIES, PROCEDURE 3: CARVEDILOL RELATED COMPOUND F** (if present)

**Solution A:** Trifluoroacetic acid and water (0.5:100)

**Solution B:** Methanol and trifluoroacetic acid (100:0.5)

**Diluent:** Water and acetonitrile (1:1)

**Mobile phase:** *Solution A* and *Solution B* (65:35)

**System suitability solution:** 1.5 mg/mL of USP

Carvedilol System Suitability Mixture RS in *Diluent*

**Sample solution:** 1.5 mg/mL of Carvedilol in *Diluent* prepared as follows. Use about 1.9 mL of *Diluent* per mg of the Carvedilol, and sonicate briefly to facilitate dissolution.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 226 nm

**Column:** 4.6-mm × 30-mm; 3-μm packing L7

**Column temperature:** 40°

**Flow rate:** 2 mL/min

**Injection size:** 10 μL

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between carvedilol and carvedilol related compound F

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of carvedilol related compound F in the portion of the sample taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

$r_U$  = peak response of carvedilol related compound F from the *Sample solution*

$r_T$  = sum of the peak responses of carvedilol and carvedilol related compound F from the *Sample solution*

$F$  = relative response factor, 1.1

Acceptance criteria: NMT 0.1%

**SPECIFIC TESTS**

- **LOSS ON DRYING** <731>: Dry a sample at 105° for 3 h: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** If a test for *Organic Impurities* by HPLC other than *Procedure 1* is used, then the labeling states the test with which the article complies.

## Carvedilol Tablets

**DEFINITION**

Carvedilol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of carvedilol ( $C_{24}H_{26}N_2O_4$ ).

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. ULTRAVIOLET ABSORPTION** <197U>
  - Wavelength range:** 250–400 nm
  - Cell:** 0.2 cm
  - Sample solution:** 0.125 mg/mL of carvedilol prepared as follows. Place 10 Tablets in a 150-mL polypropylene tube, and disintegrate the Tablets in methanol (100 mL for the Tablet strengths 3.125, 6.25, and 25 mg, and 50 mL for the Tablet strength 12.5 mg) using a mechanical homogenizer. Transfer the homogenate to an appropriate volumetric flask, and dilute with methanol to volume. Pass through a suitable PTFE filter of 0.45-μm pore size.

**ASSAY**

• **PROCEDURE**

**Buffer:** Dissolve 0.7 g of anhydrous monobasic potassium phosphate in 500 mL of water, and add 10 mL of triethylamine. Adjust with phosphoric acid to a pH of  $3.0 \pm 0.1$ .

**Mobile phase:** Dissolve 1.04 g of sodium dodecyl sulfate in 150 mL of *Buffer* in a 2-L volumetric flask, and sonicate. Add 720 mL of acetonitrile, and dilute with water to volume. Pass through a nylon 66 filter of 0.2-μm pore size.

**Diluent:** Methanol and 1 M hydrochloric acid (9:1)

**Methanol solution:** Methanol and water (1:1)

**Standard solution:** 0.0125 mg/mL of USP Carvedilol RS prepared as follows. Dissolve a quantity of USP Carvedilol RS in a mixture of *Diluent* and water (9:1),

and sonicate until the solution is clear. Dilute with *Methanol solution* to obtain the required final concentration.

**Sample stock solution:** Transfer a portion of the powdered Tablets (NLT 20), equivalent to 25 mg of carvedilol, to a 100-mL volumetric flask. Add 10 mL of water, shake by hand, then add 70 mL of *Diluent*, and sonicate for 30 min. Shake on a mechanical shaker for about 30 min, and dilute with *Diluent* to volume to prepare a 0.25-mg/mL solution. Centrifuge an appropriate amount (about 50 mL) at 2000 rpm for 10 min.

**Sample solution:** 0.0125 mg/mL of carvedilol in *Methanol solution* from the *Sample stock solution*. Pass a portion of the solution through a suitable syringe filter of 0.45- $\mu$ m pore size, discard the first 5 mL, and use the filtrate as the *Sample solution*.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm  $\times$  50-mm; packing L7

**Column temperature:** 40°

**Flow rate:** 1 mL/min

**Run time:** 30 min

**Injection size:** 25  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of carvedilol ( $C_{24}H_{26}N_2O_4$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

##### Test 1

**Medium:** 0.7% (7 mL/L) of hydrochloric acid, adjusted with 50% (w/w) sodium hydroxide to a pH of  $1.45 \pm 0.2$ ; 900 mL; deaerated

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Standard stock solution:** Transfer about 7 mg of USP Carvedilol RS to a 250-mL volumetric flask. Add 5 mL of methanol, and sonicate until dissolved. Cool to room temperature, dilute with *Medium* to volume, and mix well.

**Standard solution:** On the basis of the label claim and using the *Standard stock solution*, prepare a solution of USP Carvedilol RS in *Medium* having an appropriate concentration ( $C_S$ ), as shown in *Table 1*.

**Table 1**

Label Claim (mg)	$C_S$ (mg/mL)
25	0.028
12.5	0.014
6.25	0.007
3.125	0.0035

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

**Analytical wavelengths:** 285 and 380 nm

**Path length:** 1 cm

**Blank:** *Medium*

**Analysis:** Calculate the corrected absorbance of the *Standard solution* and the *Sample solution*:

$$A_{\text{corr}} = A_{285} - A_{380}$$

$A_{\text{corr}}$  = corrected absorbance of the *Standard solution* or the *Sample solution*

$A_{285}$  = absorbance of the *Standard solution* or the *Sample solution* at 285 nm

$A_{380}$  = absorbance of the *Standard solution* at 380 nm  
Calculate the percentage of carvedilol dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times (V/L) \times 100$$

$A_U$  = corrected absorbance from the *Sample solution*

$A_S$  = corrected absorbance from the *Standard solution*

$C_S$  = corrected concentration of the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Tablet)

**Tolerances:** NLT 80% (Q) of the labeled amount of carvedilol ( $C_{24}H_{26}N_2O_4$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** Simulated gastric fluid without enzymes; 900 mL

**Apparatus 2, Time, Standard stock solution, Standard solution, Sample solution, and Analysis:** Proceed as directed in *Test 1*.

**Tolerances:** NLT 80% (Q) of the labeled amount of carvedilol ( $C_{24}H_{26}N_2O_4$ ) is dissolved.

**Test 3:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Medium:** Simulated gastric fluid with pepsin, pH 1.45 (dissolve 12.0 g of sodium chloride and 19.2 g of purified pepsin (porcine origin, activity 800–2500 Units/mg of protein) in 18 mL of hydrochloric acid and sufficient water to make 6 L; adjust with hydrochloric acid to a pH of 1.45); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Buffer:** 2.72 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of  $2.0 \pm 0.05$ .

**Mobile phase:** *Buffer* and acetonitrile (650:350)

**Standard stock solution:** 1.4 mg/mL of USP Carvedilol RS in methanol

**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of ( $L/900$ ) mg/mL, where  $L$  is the Tablet label claim, in mg.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm  $\times$  15-mm; 5- $\mu$ m packing L7

**Column temperature:** 35°

**Flow rate:** 1.5 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Column efficiency:** NLT 3500 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis:** Calculate the percentage of carvedilol dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of the *Standard solution* (mg/mL)  
 $L$  = label claim (mg/Tablet)  
 $V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of carvedilol ( $C_{24}H_{26}N_2O_4$ ) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905)**

**Buffer, Mobile phase, Diluent, Methanol solution, Standard solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Sample solution:** 0.25 mg/mL of carvedilol prepared as follows. Place 1 Tablet into a volumetric flask of appropriate size, based on the label claim. Add water to the flask up to about 10% of volume, and shake by hand to disintegrate the Tablet. Fill the flask up to 75% of volume with *Diluent*, and sonicate for 30 min to obtain complete disintegration. Shake on a mechanical shaker for 30 min, allow to cool, and dilute with *Diluent* to volume. Centrifuge an appropriate amount of this solution for 10 min at 2400 rpm, and transfer 4 mL of supernatant into a 100-mL volumetric flask. Fill the flask to about 85% of volume with *Methanol solution*, and sonicate for 20 min, with intermittent shaking. Dilute with *Methanol solution* to volume, and pass through a suitable syringe filter of 0.45- $\mu$ m pore size.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of carvedilol ( $C_{24}H_{26}N_2O_4$ ) in the Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** Meet the requirements

**IMPURITIES**

• **ORGANIC IMPURITIES**

**Buffer, Mobile phase, Diluent, Methanol solution, and Sample stock solution:** Prepare as directed in the *Assay*.

**Standard stock solution:** Use the *Standard solution* from the *Assay*.

**Standard solution:** 1.25  $\mu$ g/mL USP Carvedilol RS in a mixture of *Diluent* and water (1:1) from the *Standard stock solution*

**Sample solution:** Dilute with water to volume, 25 mL of the supernatant from the *Sample stock solution* in a 50-mL volumetric flask. Pass a portion of the solution through a suitable syringe filter of 0.45- $\mu$ m pore size.

**Chromatographic system:** Proceed as directed in the *Assay*, except for *Injection size*.

**Injection size:** 15  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 3.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*  
 $r_S$  = peak response of carvedilol from the *Standard solution*

$C_S$  = concentration of USP Carvedilol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of carvedilol in the *Sample solution* (mg/mL)

**Acceptance criteria**

**Individual impurities:** NMT 0.2% (specified or unspecified)

**Total impurities:** NMT 1.0%

[NOTE—Disregard any peaks with a relative retention time less than or equal to 0.04 and peaks with less than 0.05% of the nominal carvedilol peak response in the *Sample solution*.]

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers protected from moisture. Store at controlled room temperature.

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

• **USP REFERENCE STANDARDS (11)**  
 USP Carvedilol RS

## Casanthranol

» Casanthranol is obtained from *Cascara Sagrada*. It contains in each 100 g not less than 20.0 g of total hydroxyanthracene derivatives calculated on the dried basis, calculated as cascaroside A. Not less than 80 percent of the total hydroxyanthracene derivatives consists of cascarosides, calculated as cascaroside A.

**Packaging and storage**—Preserve in tight, light-resistant containers, at a temperature not exceeding 30°.

**Loss on drying (731)**—Dry it in vacuum at 80° for 16 hours: it loses not more than 10.0% of its weight.

**Residue on ignition (281):** not more than 4.0%.

**Heavy metals, Method II (231):** 0.0025%.

**Assay for total hydroxyanthracene derivatives**—[NOTE 1—Perform all extractions by shaking vigorously, and allow all phases to separate completely before transferring. Entrapment of aglycones into the aqueous phase, as indicated by a value of less than 2.6 for the ratio of the absorbance of the final solution at 515 nm to that at 440 nm, may lead to false results. NOTE 2—Throughout this assay, use 1 N sodium hydroxide that is prepared without added barium ions as directed for *Volumetric Solutions* in the section *Reagents, Indicators, and Solutions*.]

**Ferric chloride solution**—Dissolve 100 g of ferric chloride in water to make 100 mL.

**Assay solution**—Mix a portion of Casanthranol, and transfer an accurately weighed quantity of about 500 mg to a 100-mL volumetric flask. Add about 30 mL of 70 percent alcohol, swirl to dissolve, dilute with 70 percent alcohol to volume, and mix. Quickly filter through soft, rapid-flow filter paper, taking precautions to minimize loss by evaporation.

**Assay preparation**—Pipet 10 mL of *Assay solution* into a separatory funnel containing 5 mL of water and 2 drops of 1 N hydrochloric acid. Extract with 40 mL of methylene chloride, and transfer the lower layer to a second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, discard the lower layer, and transfer the water layer to the first separatory funnel. Extract the combined water layers with 40 mL of methylene chloride, and transfer the lower layer to the second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, and discard the lower layer. Transfer the combined water layers, with the aid of water,

to a 50-mL volumetric flask, filtering through a small pledget of cotton, water-wet, dilute with water to volume, and mix.

**Procedure**—Pipet 10 mL of *Assay preparation* into a flask containing 2 mL of *Ferric chloride solution* and 12 mL of hydrochloric acid. Attach a condenser arranged for refluxing, and heat for 3 hours by keeping the flask immersed in boiling water or continuously exposed to steam heat. Cool, wash down the condenser, and transfer to a separatory funnel with the aid of 4 mL of 1 N sodium hydroxide and five 6-mL portions of water. Extract with 20 mL of methylene chloride, and transfer the lower layer to another separatory funnel. Repeat the extraction with three additional 20-mL portions of methylene chloride, wash the combined methylene chloride extracts with two 10-mL portions of water, shaking each time for 2 minutes, and discard the water washings. Transfer the washed methylene chloride extract to a 100-mL volumetric flask, dilute with methylene chloride to volume, and mix. Evaporate a 20.0-mL portion carefully on a water bath to dryness, and dissolve the residue in 10.0 mL of a 1 in 200 solution of magnesium acetate in methanol. Determine the absorbance against methanol as a reference, in 1-cm cells at the wavelength of maximum absorbance at about 515 nm. Calculate the quantity, in mg, of total hydroxyanthracene derivatives in the portion of Casanthranol taken by the formula:

$$155A_U$$

in which  $A_U$  is the absorbance of the solution from the *Assay preparation*.

**Assay for cascarosides**—[NOTE 1—Perform all extractions by shaking vigorously, and allow all phases to separate completely before transferring. Entrapment of aglycones into the aqueous phase, as indicated by a value of less than 2.7 for the ratio of the absorbance of the final solution at 515 nm to that at 440 nm, may lead to false results. NOTE 2—Throughout this assay, use 1 N sodium hydroxide that is prepared without added barium ions as directed for *Volumetric Solutions* in the section *Reagents, Indicators, and Solutions*.]

**Ferric chloride solution and Assay solution**—Prepare as directed in the *Assay for total hydroxyanthracene derivatives*.

**Assay preparation**—Pipet 10 mL of *Assay solution* into a separatory funnel containing 5 mL of water and 2 drops of 1 N hydrochloric acid. Extract with 40 mL of methylene chloride, and transfer the lower layer to a second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, discard the lower layer, and transfer the water layer to the first separatory funnel. Extract the combined water layers with 40 mL of methylene chloride, and transfer the lower layer to the second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, discard the lower layer, and transfer the water layer to the first separatory funnel. Extract the combined aqueous phase with 30 mL of clear, freshly prepared water-saturated ethyl acetate, and transfer the water layer to another separatory funnel. Repeat the extraction with two additional 30-mL portions of the freshly prepared water-saturated ethyl acetate. Add 5 mL of water to the combined ethyl acetate extracts, shake, allow the phases to separate, discard the ethyl acetate extracts, and add 30 mL of the freshly prepared water-saturated ethyl acetate to the water wash. Shake, allow the phases to separate, and discard the ethyl acetate phase. Transfer the combined aqueous phases, with the aid of water, to a 50-mL volumetric flask, filtering through a small pledget of cotton, water-wet, dilute with water to volume, and mix.

**Procedure**—Pipet 15 mL of *Assay preparation* into a flask containing 2 mL of *Ferric chloride solution* and 12 mL of hydrochloric acid. Attach a condenser arranged for refluxing, and heat for 3 hours by keeping the flask immersed in boiling water or continuously exposed to steam heat. Cool, wash down the condenser, and transfer to a separatory fun-

nel with the aid of 4 mL of 1 N sodium hydroxide and five 6-mL portions of water. Extract with 20 mL of methylene chloride, and transfer the lower layer to another separatory funnel. Repeat the extraction with three additional 20-mL portions of methylene chloride, wash the combined methylene chloride extracts with two 10-mL portions of water, shaking each time for 2 minutes, and discard the water washings. Transfer the washed methylene chloride extract to a 100-mL volumetric flask, dilute with methylene chloride to volume, and mix. Evaporate a 20.0-mL portion carefully on a water bath to dryness, and dissolve the residue in 10.0 mL of a 1 in 200 solution of magnesium acetate in methanol. Determine the absorbance, against methanol as a reference, in 1-cm cells at the wavelength of maximum absorbance at about 515 nm. Calculate the quantity, in mg, of cascarosides in the portion of Casanthranol taken by the formula:

$$103.5A_U$$

in which  $A_U$  is the absorbance of the solution from the *Assay preparation*.

## Cascara Sagrada

### DEFINITION

Cascara Sagrada is the dried bark of *Frangula purshiana* (DC.) J. G. Cooper (syn. *Rhamnus purshiana* DC) (Fam. Rhamnaceae). It yields NLT 7.0% of total hydroxyanthracene derivatives, calculated as cascaroside A, and calculated on the dried basis. NLT 60% of the total hydroxyanthracene derivatives consists of cascarosides, calculated as cascaroside A.

[NOTE—Collect Cascara Sagrada not less than one year before use.]

### IDENTIFICATION

#### • A.

**Sample:** 100 mg of powdered Cascara Sagrada

**Analysis:** Add the *Sample* to 10 mL of hot water, shake the mixture occasionally until it is cold, filter, dilute the filtrate with water to 10 mL, and add 10 mL of 6 N ammonium hydroxide.

**Acceptance criteria:** An orange color is produced.

#### • B.

**Sample:** A portion of Cascara Sagrada

**Analysis:** Treat the *Sample* with 6 N ammonium hydroxide.

**Acceptance criteria:** It becomes red to reddish brown in color.

#### • C.

**Sample:** 100 mg of powdered Cascara Sagrada

**Analysis:** Macerate the *Sample* with 1 mL of alcohol, add 10 mL of water, boil the mixture, then cool, filter, and shake the filtrate with 10 mL of ether: a greenish-yellow ether layer separates. Shake 3 mL of the ether layer with 3 mL of 6 N ammonium hydroxide, and dilute the separated ammonia solution with 20 mL of water.

**Acceptance criteria:** A distinct orange-pink color remains.

### COMPOSITION

#### • CONTENT OF TOTAL HYDROXYANTHRACENE DERIVATIVES

Perform all extractions by shaking vigorously, and allow all phases to separate completely before transferring. Entrapment of aglycones into the aqueous phase, as indicated by a value of less than 2.6 for the ratio of the absorbance of the final solution at 515 nm to that at 440 nm, may lead to false results.

Throughout this procedure, use 1 N sodium hydroxide that is prepared without added barium ions as directed in *Reagents, Indicators, and Solutions—Volumetric Solutions*.

**Ferric chloride solution:** 1 g/mL of ferric chloride in water

**Sample stock solution:** Add 1 g of Cascara Sagrada to 70 mL of boiling water, boil for several min, with stirring. Allow to cool, and transfer with the aid of water to a 100-mL volumetric flask. Dilute with water to volume, mix, and filter through suitable filter paper.

**Sample solution:** Pipet 10 mL of *Sample stock solution* into a separatory funnel containing 5 mL of water and 2 drops of 1 N hydrochloric acid. Extract with 40 mL of methylene chloride, and transfer the lower layer to a second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, discard the lower layer, and transfer the water layer to the first separatory funnel. Extract the combined water layers with 40 mL of methylene chloride, and transfer the lower layer to the second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, and discard the lower layer. Transfer the combined water layers, with the aid of water, to a 50-mL volumetric flask, dilute with water to volume, and mix.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Visible

**Analytical wavelength:** 515 nm

**Cell:** 1 cm

**Blank:** Methanol

#### Analysis

**Sample:** *Sample solution*

Pipet 15 mL of *Sample solution* into a flask containing 2 mL of *Ferric chloride solution* and 12 mL of hydrochloric acid. Attach a condenser arranged for refluxing, and heat for 3 h by keeping the flask immersed in boiling water or continuously exposed to steam heat. Cool, wash down the condenser, and transfer to a separatory funnel with the aid of 4 mL of 1 N sodium hydroxide and five 6-mL portions of water. Extract with 20 mL of methylene chloride, and transfer the lower layer to another separatory funnel. Repeat the extraction with three additional 20-mL portions of methylene chloride, wash the combined methylene chloride extracts with two 10-mL portions of water, shaking each time for 2 min, and discard the water washings. Transfer the washed methylene chloride extract to a 100-mL volumetric flask, dilute with methylene chloride to volume, and mix. Evaporate a 15.0-mL portion carefully on a water bath to dryness, and dissolve the residue in 10.0 mL of a 5-mg/mL solution of magnesium acetate in methanol.

Calculate the quantity, in mg, of total hydroxyanthracene derivatives ( $T_{HD}$ ) in the portion of Cascara Sagrada taken:

$$T_{HD} = A_U \times F$$

$A_U$  = absorbance of the *Sample solution*

$F$  = conversion factor, 138. [NOTE—This conversion factor considers an absorptivity of 16.1 for cascaroside A and the dilutions to prepare the solution for analysis.]

Calculate the percentage of of total hydroxyanthracene derivatives, calculated as cascaroside A:

$$\text{Result} = (T_{HD}/W) \times 100$$

$W$  = weight of Cascara Sagrada taken to prepare the *Sample stock solution* (mg)

**Acceptance criteria:** NLT 7.0%, calculated on the dried basis

#### • CONTENT OF CASCAROSIDES

Perform all extractions by shaking vigorously, and allow all phases to separate completely before transferring. Entrainment of aglycones into the aqueous phase, as indicated by a value of less than 2.7 for the ratio of the

absorbance of the final solution at 515 nm to that at 440 nm, may lead to false results.

Throughout this procedure, use 1 N sodium hydroxide that is prepared without added barium ions as directed in *Reagents, Indicators, and Solutions—Volumetric Solutions*.

**Ferric chloride solution and Sample stock solution:** Prepare as directed in the *Assay for Content of Total Hydroxyanthracene Derivatives*.

**Sample solution:** Pipet 10 mL of *Sample stock solution* into a separatory funnel containing 5 mL of water and 2 drops of 1 N hydrochloric acid. Extract with 40 mL of methylene chloride, and transfer the lower layer to a second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, discard the lower layer, and transfer the water layer to the first separatory funnel. Extract the combined water layers with 40 mL of methylene chloride, and transfer the lower layer to the second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, discard the lower layer, and transfer the water layer to the first separatory funnel. Extract the combined aqueous phase with 30 mL of clear, freshly prepared, water-saturated ethyl acetate, and transfer the water layer to another separatory funnel. Repeat the extraction with two additional 30-mL portions of the freshly prepared, water-saturated ethyl acetate. Add 5 mL of water to the combined ethyl acetate extracts, shake, allow the phases to separate, discard the ethyl acetate extracts, and add 30 mL of the freshly prepared, water-saturated ethyl acetate to the water wash. Shake, allow the phases to separate, and discard the ethyl acetate phase. Transfer the combined aqueous phases, with the aid of water, to a 50-mL volumetric flask. Dilute with water to volume.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Visible

**Analytical wavelength:** 515 nm

**Cell:** 1 cm

**Blank:** Methanol

#### Analysis

Proceed as directed for *Analysis* in *Content of Total Hydroxyanthracene Derivatives*, except to evaporate a 20.0-mL portion of the methylene chloride solution instead of 15.0 mL.

**Sample:** *Sample solution*

Determine the absorbance and calculate the percentage of cascarosides with respect to the content of total hydroxyanthracene derivatives in the portion of Cascara Sagrada taken:

$$\text{Result} = (A_U/T_{HD}) \times F \times 100$$

$A_U$  = absorbance of the *Sample solution*

$T_{HD}$  = weight of total hydroxyanthracene derivatives (mg)

$F$  = conversion factor, 103.5. [NOTE—This conversion factor considers an absorptivity of 16.1 for cascaroside A and the dilutions to prepare the solution for analysis.]

**Acceptance criteria:** NLT 60% of the total hydroxyanthracene derivatives consists of cascarosides, calculated as cascaroside A on the dried basis

#### SPECIFIC TESTS

##### • BOTANIC CHARACTERISTICS

##### Macroscopic

**Cascara Sagrada:** The bark is usually in the form of flattened or transversely curved pieces, occasionally in quills of variable length and from 1 to 5 mm in thickness. The outer surface is brown, purplish brown, or brownish red, longitudinally ridged, with or without grayish or whitish lichen patches, sometimes with numerous lenticels and occasionally with moss attached.

The inner surface is longitudinally striate, light yellow, weak reddish brown, or moderate yellowish brown. The fracture is short with projections of phloem fiber bundles in the inner bark.

**Powdered Cascara Sagrada:** The powder is moderate yellowish brown to dusky yellowish orange.

#### Microscopic

**Cascara Sagrada:** The transverse section of the bark shows a yellowish-brown, purple, or reddish-brown cork of up to 10 or more rows of small cells; stone cells in yellowish, tangentially elongated groups of 20–50 cells in the cortex, pericycle, and outer phloem regions; phloem rays 1–4 cells wide, 15–25 cells deep, frequently diagonal or curved, forming converging groups; phloem fibers in small bundles, more or less surrounded by crystal fibers and located between the phloem rays; parenchyma with brown walls and containing starch grains and calcium oxalate crystals.

**Powdered Cascara Sagrada:** It shows numerous broken phloem fiber bundles with accompanying crystal fibers containing monoclinic prisms of calcium oxalate; stone cells more or less adherent, in small groups with thick, finely lamellated and porous walls; fragments of reddish-brown to yellow cork; masses of parenchyma and phloem ray cells colored reddish brown to orange upon the addition of a solution of an alkali; starch grains spheroidal, up to 8 µm in diameter; calcium oxalate in monoclinic prisms or rosette aggregates from 6 to 20 µm in diameter, occasionally up to 45 µm in diameter.

- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter** (561): NMT 4.0%
- **WATER DETERMINATION, Method III, Procedure for Articles of Botanical Origin** (921): Dry a sample at 105° for 5 h: it loses NMT 12.0% of its weight.

## Cascara Sagrada Extract

### DEFINITION

Cascara Sagrada Extract contains, in each 100 g, NLT 10.0 g and NMT 12.0 g of total hydroxyanthracene derivatives, of which NLT 50% consists of cascariosides, both calculated as cascarioside A.

Mix 900 g of Cascara Sagrada, in coarse powder, with 4000 mL of boiling water, and macerate the mixture for 3 h. Then transfer it to a percolator, allow it to drain, exhaust it by percolation, using boiling water as the menstruum, and collect 5000 mL of percolate. Evaporate the percolate to dryness, reduce the Extract to a fine powder, and, after assaying, add sufficient starch, dried at 100°, or other inert, nontoxic diluents to make the product contain, in each 100 g, 11 g of hydroxyanthracene derivatives. Mix the powders, and pass the Extract through a number 60 sieve.

### ASSAY

#### • CONTENT OF TOTAL HYDROXYANTHRACENE DERIVATIVES

Perform all extractions by shaking vigorously, and allow all phases to separate completely before transferring. Entrainment of aglycones into the aqueous phase, as indicated by a value of less than 2.6 for the ratio of the absorbance of the final solution at 515 nm to that at 440 nm, may lead to false results.

Throughout this assay, use 1 N sodium hydroxide that is prepared without added barium ions as directed in *Reagents, Indicators, and Solutions—Volumetric Solutions*.

**Ferric chloride solution:** 1 g/mL of ferric chloride in water

**Sample stock solution:** Transfer 1 g of Extract to a 100-mL volumetric flask. Add 60 mL of 70% alcohol, swirl or sonicate for 15–20 min several times, and allow

to stand overnight. Sonicate or swirl for 10–15 min, dilute with 70% alcohol to volume, mix, and filter through suitable filter paper.

**Sample solution:** Pipet 10 mL of *Sample stock solution* into a separatory funnel containing 5 mL of water and 2 drops of 1 N hydrochloric acid. Extract with 40 mL of methylene chloride, and transfer the lower layer to a second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, discard the lower layer, and transfer the water layer to the first separatory funnel. Extract the combined water layers with 40 mL of methylene chloride, and transfer the lower layer to the second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, and discard the lower layer. Transfer the combined water layers, with the aid of water, to a 50-mL volumetric flask, and dilute with water to volume, and mix.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Visible

**Analytical wavelength:** 515 nm

**Cell:** 1 cm

**Blank:** Methanol

#### Analysis

**Sample:** *Sample solution*

**Analysis:** Pipet 10 mL of *Sample solution* into a flask containing 2 mL of *Ferric chloride solution* and 12 mL of hydrochloric acid. Attach a condenser arranged for refluxing, and heat for 3 h by keeping the flask immersed in boiling water or continuously exposed to steam heat. Cool, wash down the condenser, and transfer to a separatory funnel with the aid of 4 mL of 1 N sodium hydroxide and five 6-mL portions of water. Extract with 20 mL of methylene chloride, and transfer the lower layer to another separatory funnel. Repeat the extraction with three additional 20-mL portions of methylene chloride, wash the combined methylene chloride extracts with two 10-mL portions of water, shaking each time for 2 min, and discard the water washings. Transfer the washed methylene chloride extract to a 100-mL volumetric flask, and dilute with methylene chloride to volume. Evaporate a 20.0-mL portion carefully on a water bath to dryness, and dissolve the residue in 10.0 mL of a 5 mg/mL solution of magnesium acetate in methanol.

Calculate the quantity, in mg, of total hydroxyanthracene derivatives ( $T_{HD}$ ) in the portion of Cascara Sagrada Extract taken:

$$T_{HD} = A_U \times F$$

$A_U$  = absorbance of the *Sample solution*

$F$  = conversion factor, 155.2. [NOTE—This conversion factor considers an absorptivity of 16.1 for cascarioside A and the dilutions to prepare the solution for analysis.]

Calculate the percentage of total hydroxyanthracene derivatives in the portion of Cascara Sagrada Extract taken:

$$\text{Result} = (T_{HD}/W) \times 100$$

$W$  = weight of Cascara Sagrada Extract taken to prepare the *Sample stock solution* (mg)

**Acceptance criteria:** 10.0%–12.0% of total hydroxyanthracene derivatives, calculated as cascarioside A

#### • CONTENT OF CASCARIOSIDES

Perform all extractions by shaking vigorously, and allow all phases to separate completely before transferring. Entrainment of aglycones into the aqueous phase, as indicated by a value of less than 2.7 for the ratio of the absorbance of the final solution at 515 nm to that at 440 nm, may lead to false results.

Throughout this assay, use 1 N sodium hydroxide that is prepared without added barium ions as directed in *Reagents, Indicators, and Solutions—Volumetric Solutions*.

**Ferric chloride solution and Sample stock solution:** Prepare as directed in the *Assay for Content of Total Hydroxyanthracene Derivatives*.

**Sample solution:** Pipet 10 mL of *Sample stock solution* into a separatory funnel containing 5 mL of water and 2 drops of 1 N hydrochloric acid. Extract with 40 mL of methylene chloride, and transfer the lower layer to a second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, discard the lower layer, and transfer the water layer to the first separatory funnel. Extract the combined water layers with 40 mL of methylene chloride, and transfer the lower layer to the second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, discard the lower layer, and transfer the water layer to the first separatory funnel. Extract the combined aqueous phase with 30 mL of clear, freshly prepared, water-saturated ethyl acetate, and transfer the water layer to another separatory funnel. Repeat the extraction with two additional 30-mL portions of the freshly prepared, water-saturated ethyl acetate. Add 5 mL of water to the combined ethyl acetate extracts, shake, allow the phases to separate, discard the ethyl acetate extracts, and add 30 mL of the freshly prepared, water-saturated ethyl acetate to the water wash. Shake, allow the phases to separate, and discard the ethyl acetate phase. Transfer the combined aqueous phases, with the aid of water, to a 50-mL volumetric flask. Dilute with water to volume, and mix.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Visible

**Analytical wavelength:** 515 nm

**Cell:** 1 cm

**Blank:** Methanol

#### Analysis

**Sample:** *Sample solution*

Pipet 25 mL of the *Sample solution* into a flask containing 2 mL of *Ferric chloride solution* and 12 mL of hydrochloric acid. Attach a condenser arranged for refluxing, and heat for 3 h by keeping the flask immersed in boiling water or continuously exposed to steam heat. Cool, wash down the condenser, and transfer to a separatory funnel with the aid of 4 mL of 1 N sodium hydroxide and five 6-mL portions of water. Extract with 20 mL of methylene chloride, and transfer the lower layer to another separatory funnel. Repeat the extraction with three additional 20-mL portions of methylene chloride, wash the combined methylene chloride extracts with two 10-mL portions of water, shaking each time for 2 min, and discard the water washings. Transfer the washed methylene chloride extract to a 100-mL volumetric flask, dilute with methylene chloride to volume, and mix. Evaporate a 20.0-mL portion carefully on a water bath to dryness, and dissolve the residue in 10.0 mL of a 5-mg/mL solution of magnesium acetate in methanol.

Determine the absorbance and calculate the percentage of cascarosides with respect to the content of total hydroxyanthracene derivatives in the portion of Cascara Sagrada Extract taken:

$$\text{Result} = (A_U/T_{HD}) \times F \times 100$$

$A_U$  = absorbance of the *Sample solution*

$T_{HD}$  = weight of total hydroxyanthracene derivatives (mg)

$F$  = conversion factor, 62.06. [NOTE—This conversion factor considers an absorptivity of 16.1 for cascaroside A and the dilutions to prepare the solution for analysis.]

**Acceptance criteria:** NLT 50% of total hydroxyanthracene derivatives calculated as cascaroside A

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers at a temperature not exceeding 30°.

## Cascara Tablets

#### DEFINITION

Cascara Tablets are prepared from Cascara Sagrada Extract.

They contain NLT 9.35% and NMT 12.65% of total hydroxyanthracene derivatives, calculated as cascaroside A, in the labeled amount of Cascara Sagrada Extract. NLT 50% of the hydroxyanthracene derivatives are cascarosides, calculated as cascaroside A.

#### STRENGTH

##### • CONTENT OF TOTAL HYDROXYANTHRACENE DERIVATIVES

Perform all extractions by shaking vigorously, and allow all phases to separate completely before transferring. Entrapment of aglycones into the aqueous phase, as indicated by a value of less than 2.6 for the ratio of the absorbance of the final solution at 515 nm to that at 440 nm, may lead to false results.

Throughout this assay, use 1 N sodium hydroxide that is prepared without added barium ions as directed in *Reagents, Indicators, and Solutions, Volumetric Solutions*.

**Ferric chloride solution:** 1 g/mL of ferric chloride in water

**Sample stock solution:** Weigh and finely powder NLT 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to 1 g of Cascara Sagrada Extract, to a 100-mL volumetric flask. Add 60 mL of 70% alcohol, swirl or sonicate for 15–20 min several times, and allow to stand overnight. Sonicate or swirl for 10–15 min, dilute with 70% alcohol to volume, mix, and filter through suitable filter paper.

**Sample solution:** Pipet 10 mL of *Sample stock solution* into a separatory funnel containing 5 mL of water and 2 drops of 1 N hydrochloric acid. Extract with 40 mL of methylene chloride, and transfer the lower layer to a second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, discard the lower layer, and transfer the water layer to the first separatory funnel. Extract the combined water layers with 40 mL of methylene chloride, and transfer the lower layer to the second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, and discard the lower layer. Transfer the combined water layers, with the aid of water, to a 50-mL volumetric flask, dilute with water to volume, and mix.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Visible

**Analytical wavelength:** 515 nm

**Cell:** 1 cm

**Blank:** Methanol

#### Analysis

**Sample:** *Sample solution*

Pipet 10 mL of *Sample solution* into a flask containing 2 mL of *Ferric chloride solution* and 12 mL of hydrochloric acid. Attach a condenser arranged for refluxing, and heat for 3 h by keeping the flask immersed in boiling water or continuously exposed to steam heat. Cool, wash down the condenser, and transfer to a separatory funnel with the aid of 4 mL of 1 N sodium hydroxide and five 6-mL portions of water. Extract with 20 mL of methylene chloride, and transfer the lower layer to another separatory funnel. Repeat the extraction with three additional 20-mL portions of methylene chloride,

wash the combined methylene chloride extracts with two 10-mL portions of water, shaking each time for 2 min, and discard the water washings. Transfer the washed methylene chloride extract to a 100-mL volumetric flask, dilute with methylene chloride to volume, and mix.

Evaporate a 15.0-mL portion carefully on a water bath to dryness, and dissolve the residue in 10.0 mL of a 5-mg/mL solution of magnesium acetate in methanol. Calculate the quantity, in mg, of total hydroxyanthracene derivatives ( $T_{HD}$ ) in the portion of Cascara Sagrada Extract taken:

$$T_{HD} = A_U \times F$$

$A_U$  = absorbance of the *Sample solution*  
 $F$  = conversion factor, 206.9. [NOTE—This conversion factor considers an absorptivity of 16.1 for cascaroside A, and the dilutions to prepare the solution for analysis.]

Calculate the percentage of total hydroxyanthracene derivatives in the nominal amount of Cascara Sagrada Extract taken:

$$\text{Result} = (T_{HD}/W) \times 100$$

$W$  = nominal weight of Cascara Sagrada Extract in the portion of Tablets powder taken to prepare the *Sample stock solution* (mg)

**Acceptance criteria:** 9.35%–12.65% in the labeled amount of Cascara Sagrada Extract, calculated as cascaroside A

#### • CONTENT OF CASCAROSIDES

Perform all extractions by shaking vigorously, and allow all phases to separate completely before transferring. Entrainment of aglycones into the aqueous phase, as indicated by a value of less than 2.7 for the ratio of the absorbance of the final solution at 515 nm to that at 440 nm, may lead to false results.

Throughout this assay, use 1 N sodium hydroxide that is prepared without added barium ions as directed in *Reagents, Indicators, and Solutions, Volumetric Solutions*.

**Ferric chloride solution and Sample stock solution:** Prepare as directed in *Content of Total Hydroxyanthracene Derivatives*.

**Sample solution:** Pipet 10 mL of *Sample stock solution* into a separatory funnel containing 5 mL of water and 2 drops of 1 N hydrochloric acid. Extract with 40 mL of methylene chloride, and transfer the lower layer to a second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, discard the lower layer, and transfer the water layer to the first separatory funnel. Extract the combined water layers with 40 mL of methylene chloride, and transfer the lower layer to the second separatory funnel. Add 10 mL of water to the second separatory funnel, and shake. Allow to separate, and discard the lower layer. Transfer the water layer to the first separatory funnel. Extract the combined aqueous phase with 30 mL of clear, freshly prepared, water-saturated ethyl acetate, and transfer the water layer to another separatory funnel. Repeat the extraction with two additional 30-mL portions of the freshly prepared, water-saturated ethyl acetate. Add 5 mL of water to the combined ethyl acetate extracts, shake, allow the phases to separate, discard the ethyl acetate extracts, and add 30 mL of the freshly prepared, water-saturated ethyl acetate to the water wash. Shake, allow the phases to separate, and discard the ethyl acetate phase. Transfer the combined aqueous phases, with the aid of water, to a 50-mL volumetric flask. Dilute with water to volume, and mix.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Visible

**Analytical wavelength:** 515 nm

**Cell:** 1 cm

**Blank:** Methanol

#### Analysis

**Sample:** *Sample solution*

Prepare as directed for *Analysis* in *Content of Total Hydroxyanthracene Derivatives*, except to pipet 20 mL of *Sample solution*.

Determine the absorbance, and calculate the percentage of cascarosides with respect to the content of total hydroxyanthracene derivatives in the nominal amount of Cascara Sagrada Extract in the portion of Tablets powder taken:

$$\text{Result} = (A_U/T_{HD}) \times F \times 100$$

$A_U$  = absorbance of the *Sample solution*

$T_{HD}$  = weight of total hydroxyanthracene derivatives (mg)

$F$  = conversion factor, 103.5. [NOTE—This conversion factor considers an absorptivity of 16.1 for cascaroside A, and the dilutions to prepare the solution for analysis.]

**Acceptance criteria:** NLT 50% of the content of total hydroxyanthracene derivatives are cascarosides, calculated as cascaroside A.

#### PERFORMANCE TESTS

- **DISINTEGRATION** (701): 60 min
- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers; if the Tablets are coated, well-closed containers may be used.

## Cascara Sagrada Fluidextract

#### DEFINITION

Prepare Cascara Sagrada Fluidextract as follows. To 1000 g of coarsely ground Cascara Sagrada add 3000 mL of boiling water, and allow to macerate in a suitable percolator for 2 h. Allow the percolation to proceed at a moderate rate, gradually adding boiling water until the drug is practically exhausted of its active principles. Evaporate the percolate on a water bath or in a vacuum still to NMT 800 mL. Cool, add 200 mL of alcohol and, if necessary, add sufficient water to make the product measure 1000 mL. Mix.

#### OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I** (611): 18.0%–20.0% of  $C_2H_5OH$

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat.

## Aromatic Cascara Fluidextract

### DEFINITION

Prepare Aromatic Cascara Fluidextract as follows.

Cascara Sagrada, as a very coarse powder	1000 g
Magnesium Oxide	120 g
Suitable sweetening agent(s)	
Suitable essential oils(s)	
Suitable flavoring agent(s)	
Alcohol	200 mL
Purified Water, a sufficient quantity, to make	1000 mL

Mix the Cascara Sagrada with *Magnesium Oxide*, moisten it uniformly with 2000 mL of boiling water, and set it aside in a shallow container for 48 h, stirring occasionally. Pack it in a percolator, and percolate with boiling water until the material is exhausted. Evaporate the percolate, at a temperature not exceeding 100°, to 750 mL, and at once dissolve in it the flavoring agent(s). When the liquid has cooled, add the *Alcohol*, in which the sweetening agent(s) and oils have been dissolved, and add sufficient water to make the Aromatic Fluidextract measure 1000 mL. Mix.

### OTHER COMPONENTS

- **ALCOHOL DETERMINATION** (611): 18%–20% of  $C_2H_5OH$ , determined by the gas-liquid chromatographic method, using acetone as the internal standard

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat.

## Castor Oil

### DEFINITION

Castor Oil is the fixed oil obtained from the seed of *Ricinus communis* L. (Fam. Euphorbiaceae). It contains no added substances.

### IMPURITIES

- **HEAVY METALS, Method II** (231): NMT 10 ppm

### SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 0.957–0.961
- **DISTINCTION FROM MOST OTHER FIXED OILS:** It is only partly soluble in solvent hexane (distinction from most other fixed oils), but it yields a clear liquid with an equal volume of alcohol (foreign fixed oils).
- **FATS AND FIXED OILS, Free Fatty Acids** (401): The free fatty acids in 10 g require NMT 3.5 mL of 0.10 N sodium hydroxide for neutralization.
- **FATS AND FIXED OILS, Hydroxyl Value** (401)  
Free acid determination  
Sample: 10 g  
Titrimetric system  
(See *Titrimetry* (541).)  
Mode: Direct titration  
Titrant: 0.5 N alcoholic potassium hydroxide VS  
Endpoint detection: Visual  
Analysis: Transfer the *Sample* to a 250-mL conical flask, add 10 mL of pyridine that has been neutralized previously to phenolphthalein, and swirl to mix. Add 1 mL of phenolphthalein TS, and titrate with *Titrant* to a

faint pink endpoint. Record the volume of *Titrant* consumed ( $V_A$ ).

### Hydroxyl value determination

Sample: 2 g

Blank: 5.0 mL of a freshly prepared mixture of 1 volume of acetic anhydride and 3 volumes of pyridine

### Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.5 N alcoholic potassium hydroxide VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a glass-stoppered, 250-mL conical flask. Add 5.0 mL of a freshly prepared mixture of 1 volume of acetic anhydride and 3 volumes of pyridine, and swirl to mix. Connect the flask to a reflux condenser, and heat on a steam bath for 2 h. Add 10 mL of water through the condenser, swirl to mix, heat on a steam bath for an additional 10 min, and allow to cool to room temperature. Add through the condenser 15 mL of normal butyl alcohol that has been neutralized previously to phenolphthalein, remove the condenser, and wash the tip of the condenser and the sides of the flask with an additional 10 mL of neutralized normal butyl alcohol. Add 1 mL of phenolphthalein TS, and titrate with *Titrant* to a faint pink endpoint.

Calculate the hydroxyl value in the portion of Oil taken:

$$\text{Result} = \{[V_B + (W \times V_A/W_A) - V_T] \times M_r \times N\} / W$$

$V_B$  = volume of *Titrant* consumed by the *Blank* (mL)

$W$  = sample weight from the hydroxyl value determination (g)

$V_A$  = volume of *Titrant* consumed by the *Sample* in the free acid determination (mL)

$W_A$  = sample weight from the free acid determination (g)

$V_T$  = volume of *Titrant* consumed by the *Sample* in the hydroxyl value determination (mL)

$M_r$  = milliequivalent weight of potassium hydroxide, 56.11 mg/mEq

$N$  = actual normality of the *Titrant*

Acceptance criteria: 160–168

- **FATS AND FIXED OILS, Iodine Value** (401): 83–88

- **FATS AND FIXED OILS, Saponification Value** (401): 176–182

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and avoid exposure to excessive heat.

## Castor Oil Capsules

### DEFINITION

Castor Oil Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of castor oil, calculated from the tests for *Weight Variation* and *Specific Gravity*.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197S)

Standard solution: 40 mg/mL of Castor Oil in chloroform

Sample solution: 40 mg/mL of the oil from Capsules in chloroform

Acceptance criteria: Meet the requirements

### PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**SPECIFIC TESTS**• **SPECIFIC GRAVITY** (841)

Sample: Capsule contents

Acceptance criteria: 0.957–0.961

• **FATS AND FIXED OILS, Free Fatty Acids** (401): The free fatty acids in 10 g require NMT 3.5 mL of 0.10 N sodium hydroxide for neutralization.• **FATS AND FIXED OILS, Hydroxyl Value** (401)

Free acid determination: Determine the amount of free acid in the Capsule contents.

Sample: 10 g of Capsule contents

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.5 N alcoholic potassium hydroxide VS

Endpoint detection: Visual

**Analysis 1:** Transfer the *Sample* to a 250-mL conical flask, add 10 mL of pyridine that has been neutralized previously to phenolphthalein, and swirl to mix. Add 1 mL of phenolphthalein TS, and titrate with *Titrant* to a faint pink endpoint. Record the volume of *Titrant* consumed.

**Hydroxyl value determination:** Determine the hydroxyl value of the Capsule contents.

Sample: 2 g from the Capsule contents

Blank: 5.0 mL of a freshly prepared mixture of 1 volume of acetic anhydride and 3 volumes of pyridine

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.5 N alcoholic potassium hydroxide VS

Endpoint detection: Visual

**Analysis 2:** Transfer the *Sample* to a glass-stoppered, 250-mL conical flask. Add 5.0 mL of a freshly prepared mixture of 1 volume of acetic anhydride and 3 volumes of pyridine, and swirl to mix. Connect the flask to a reflux condenser, and heat on a steam bath for 2 h. Add 10 mL of water through the condenser, swirl to mix, heat on a steam bath for an additional 10 min, and allow to cool to room temperature. Add through the condenser 15 mL of normal butyl alcohol that previously has been neutralized to phenolphthalein, remove the condenser, and wash the tip of the condenser and the sides of the flask with an additional 10 mL of neutralized normal butyl alcohol. Add 1 mL of phenolphthalein TS, and titrate with *Titrant* to a faint pink endpoint.

Calculate the hydroxyl value in the portion of Capsule contents taken:

$$\text{Result} = (M_r \times N/W) \times [B + (W \times A/C) - T]$$

$M_r$  = milliequivalent weight of potassium hydroxide, 56.11 mg/mEq

$N$  = actual normality of the *Titrant*

$W$  = *Sample* weight for the hydroxyl determination (g)

$B$  = *Titrant* volume consumed by the *Blank* (mL)

$A$  = *Titrant* volume consumed by the *Sample* in the free acid determination (mL)

$C$  = *Sample* weight for the free acid determination (g)

$T$  = *Titrant* volume consumed by the *Sample* in the hydroxyl determination (mL)

**Acceptance criteria:** 160–168 in mg of KOH/g of Capsule content or hydroxyl value

• **FATS AND FIXED OILS, Iodine Value** (401)

Sample: Capsule contents

Acceptance criteria: 83–88

• **FATS AND FIXED OILS, Saponification Value** (401)

Sample: Capsule contents

Acceptance criteria: 176–182

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight containers, preferably at controlled room temperature.

**Castor Oil Emulsion****DEFINITION**

Castor Oil Emulsion contains NLT 90.0% and NMT 120.0% of the labeled amount of Castor Oil.

**IDENTIFICATION**• **A.**

Sample: 10 mL of Emulsion well shaken

Analysis: Transfer the *Sample* to a 125-mL separator.

Add 10 mL of 1 N hydrochloric acid and 20 mL of solvent hexane. Shake vigorously for 2–3 min, allow the layers to separate, discard the aqueous phase, and filter the upper layer through anhydrous sodium sulfate into a small beaker. Evaporate the solvent on a steam bath, and to the residue add 1–2 drops of sulfuric acid.

**Acceptance criteria:** A red color indicates the presence of castor oil.

**ASSAY**• **PROCEDURE**

**Internal standard solution:** 12 mg/mL of di(2-ethylhexyl)phthalate in chloroform

**Standard solution:** Transfer 100 mg of castor oil to a 100-mL boiling flask equipped with a suitable reflux condenser connected by a ground-glass joint. Add 30 mL of a mixture of 300 mL of methanol and 3.7 mL of sulfuric acid, reflux in a water bath maintained at 75°–80° for 2.5 h, cool, and rinse down the condenser with 10 mL of water. Transfer the contents of the flask to a 125-mL separator with the aid of 10 mL of water. Rinse the condenser and the flask with 25 mL of solvent hexane, and transfer to the separator. Shake the separator for 2 min, and draw off the aqueous layer into a second 125-mL separator. Add 20 mL of solvent hexane to the second separator, shake for 2 min, discard the aqueous layer, and transfer the solvent hexane layer to the first separator with the aid of 10 mL of solvent hexane. Wash the combined extracts with three 5-mL portions of water, discarding the washings, and transfer the washed extract to a 125-mL conical flask through a funnel containing anhydrous sodium sulfate, with the aid of 25 mL of solvent hexane. Place the flask in a hot water bath, and evaporate with the aid of a current of air to dryness. To the residue add 10.0 mL of *Internal standard solution*, and mix until solution is complete.

**Sample solution:** Transfer an amount of Emulsion, well-shaken and nominally equivalent to 100 mg of castor oil, to a long-neck, round-bottom 100-mL boiling flask equipped with a suitable reflux condenser connected by a ground-glass joint. Prepare as directed in *Standard solution*, beginning with “Add 30 mL of a mixture of 300 mL of methanol and 3.7 mL of sulfuric acid”.

**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 1.8-m × 4-mm; packed with 4% liquid phase G25 on support S1

**Column conditioning:** Flush with helium for 2–5 min, then heat without further flushing at 250° for NLT 30 min, then cool to room temperature, and finally heat while helium is flowing through it at 250° for NLT 60 min.

**Temperature**

**Column:** 245°

**Injector:** 300°

**Detector:** 300°

**Flow rate:** Adjust to obtain a peak due to castor oil 5.5 min after introduction of the specimen and an internal standard peak 8 min after introduction of the specimen.

**Carrier gas:** Helium

**Injection size:** 5 µL

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Measure the heights of the peaks due to castor oil and the internal standard.

Calculate the percentage of castor oil in the portion of Emulsion taken:

$$\text{Result} = (R_U/R_S) \times (W_S/W_U) \times 100$$

$R_U$  = ratio of the heights of the peaks due to castor oil and internal standard, *Sample solution*

$R_S$  = ratio of the heights of the peaks due to castor oil and internal standard, *Standard solution*

$W_S$  = weight of castor oil taken to prepare the *Standard solution* (mg)

$W_U$  = nominal weight of castor oil in the amount of Emulsion taken to prepare the *Sample solution* (mg)

**Acceptance criteria:** 90.0%–120.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.

## Aromatic Castor Oil

**DEFINITION**

Aromatic Castor Oil is Castor Oil containing suitable flavoring agents. It contains NLT 95.0% of castor oil.

**ASSAY**

• **PROCEDURE**

**Internal standard solution:** 12 mg/mL of di(2-ethylhexyl)phthalate in chloroform

**Standard solution:** Transfer 100 mg of Castor Oil to a 100-mL boiling flask equipped with a suitable reflux condenser connected by a ground-glass joint. Add 30 mL of a mixture of 300 mL of methanol and 3.7 mL of sulfuric acid, reflux in a water bath maintained at 75°–80° for 2.5 h, cool, and rinse down the condenser with 10 mL of water. Transfer the contents of the flask to a 125-mL separator with the aid of 10 mL of water. Rinse the condenser and the flask with 25 mL of solvent hexane, and transfer to the separator. Shake the separator for 2 min, and draw off the aqueous layer into a second 125-mL separator. Add 20 mL of solvent hexane to the second separator, shake for 2 min, discard the aqueous layer, and transfer the solvent hexane layer to the first separator with the aid of 10 mL of solvent hexane. Wash the combined extracts with three 5-mL portions of water, discarding the washings, and transfer the washed extract to a 125-mL conical flask, through a funnel containing anhydrous sodium sulfate, with the aid of 25 mL of solvent hexane. Place the flask in a hot water bath, and evaporate with the aid of a current of air to dryness. To the residue add 10.0 mL of *Internal standard solution*, and mix until solution is complete.

**Sample solution:** Transfer an amount of Aromatic Castor Oil, well-shaken and nominally equivalent to 100 mg of castor oil, to a long-neck, round-bottom 100-mL boiling flask equipped with a suitable reflux condenser connected by a ground-glass joint. Proceed as directed for the *Standard solution*, beginning with “Add 30 mL of a mixture of 300 mL of methanol and 3.7 mL of sulfuric acid...”.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

## Cefaclor

C<sub>15</sub>H<sub>14</sub>ClN<sub>3</sub>O<sub>4</sub>S · H<sub>2</sub>O 385.82

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[(aminophenylacetyl)amino]-3-chloro-8-oxo-, monohydrate, [6R-[6α,-7β(R\*)]]-

(6R,7R)-7-[(R)-2-Amino-2-phenylacetamido]-3-chloro-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monohydrate.

3-Chloro-7-D-(2-phenylglycinamido)-3-cephem-4-carboxylic acid monohydrate [70356-03-5].  
Anhydrous 367.81 [53994-73-3].

» Cefaclor has a potency of not less than 950 µg and not more than 1020 µg of C<sub>15</sub>H<sub>14</sub>ClN<sub>3</sub>O<sub>4</sub>S per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cefaclor RS

USP Cefaclor Delta-3 Isomer RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak for cefaclor in the chromatogram of the *Assay* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Crystallinity** (695): meets the requirements.

**pH** (791): between 3.0 and 4.5, in an aqueous suspension containing 25 mg per mL.

**Water, Method I** (921): between 3.0% and 6.5%.

**Related compounds**—

**Solvent**—Dissolve 2.4 g of monobasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 2.5.

**Blank solution**—Use the *Solvent*.

**Solution A**—Dissolve 6.9 g of monobasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 4.0.

**Solution B**—Prepare a mixture of *Solution A* and acetonitrile (550:450), degassing for not more than 2 minutes.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). [NOTE—Reducing the acetonitrile content increases the retention time of cefaclor and increases the resolution between cefaclor, delta-3 isomer and cefaclor.]

**Standard solution**—Dissolve an accurately weighed quantity of USP Cefaclor RS in *Solvent* to obtain a solution having a known concentration of about 0.05 mg per mL. Sonicate briefly, if necessary, to dissolve, and avoid heating. [NOTE—Use this solution on the day it is prepared.]

**System suitability solution**—Dissolve a quantity of USP Cefaclor, Delta-3 Isomer RS in the *Standard solution* to obtain a solution having a concentration of about 0.05 mg per mL.

**Test solutions**—Transfer about 50 mg of Cefaclor, accurately weighed, to each of two 10-mL volumetric flasks, dilute each with *Solvent* to volume, and mix. Sonicate briefly, if necessary, to dissolve, and avoid heating. [NOTE—Use these *Test solutions* within 2 hours when stored at room temperature or within 20 hours when stored under refrigeration.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	95	5	equilibration
0–30	95→75	5→25	linear gradient
30–45	75→0	25→100	linear gradient
45–55	0	100	isocratic
55–60	0→95	100→5	reset composition
60–70	95	5	re-equilibration

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the retention time for the cefaclor peak is between 23 and 29 minutes; the resolution, *R*, between cefaclor, delta-3 isomer and cefaclor is not less than 2.0; and the tailing factor for the cefaclor peak is not more than 1.2. Chromatograph the *Blank solution* as directed for *Procedure*. Examine the chromatogram for any extraneous peaks, and disregard any corresponding peaks observed in the chromatogram of the *Test solutions*. [NOTE—Ensure that any extraneous peaks observed do not represent carryover from previous injections.]

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solutions* into the chromatograph, record the chromatograms, and measure all of the peak areas. Calculate the percentage of each cefaclor related compound in the portion of Cefaclor taken by the formula:

$$(CP/W)(r_i / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Cefaclor RS in the *Standard solution*; *P* is the designated potency, in µg per mg, of USP Cefaclor RS; *W* is the weight, in mg, of the portion of Cefaclor taken to prepare the respective *Test solution*; *r<sub>i</sub>* is the peak response of an individual related compound in the chromatogram obtained from the *Test solution*; and *r<sub>s</sub>* is the peak response for the cefaclor peak in the chromatogram of the *Standard solution*. Determine the mean values for each cefaclor related compound: not more than 0.5% of any individual cefaclor related compound is found, and not more than 2.0% of total cefaclor related compounds is found. In an acceptable determination, the difference between duplicate determinations of total cefaclor related compounds is not more than 0.2% absolute, or the variation from the mean of the two values is not more than 10%, whichever is greater.

**Assay**—

**Mobile phase**—Dissolve 1 g of sodium 1-pentanesulfonate in a mixture of 780 mL of water and 10 mL of triethylamine. Adjust with phosphoric acid to a pH of 2.5 ± 0.1, add 220 mL of methanol, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 15 mg of USP Cefaclor RS, accurately weighed, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Sonicate briefly, if necessary, to achieve dissolution, and avoid heating the solution. [NOTE—Use this *Standard preparation* within 8 hours if stored at room temperature, or within 20 hours if stored under refrigeration.]

**Assay preparation**—Transfer about 15 mg of Cefaclor, accurately weighed, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Sonicate briefly, if necessary, to achieve dissolution, and avoid heating the solution. [NOTE—Use this *Assay preparation* within 8 hours if stored at room temperature, or within 20 hours if stored under refrigeration.]

**Resolution solution**—Prepare a solution in *Mobile phase* containing about 0.3 mg of cefaclor and 0.3 mg of USP Cefaclor, Delta-3 Isomer RS per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 265-nm detector and a 4.6-mm × 25-cm column containing 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure*: the relative retention times for cefaclor and cefaclor, delta-3 isomer are about 0.8 and 1.0, the resolution, *R*, between the cefaclor peak and the cefaclor, delta-3 isomer peak is not less than 2.5, the tailing factor is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay* into the chromat-

ograph, record the chromatograms, and measure the responses for the major peaks. Calculate the potency, in  $\mu\text{g}$  per mg, of cefaclor ( $\text{C}_{15}\text{H}_{14}\text{ClN}_3\text{O}_4\text{S}$ ) in each mg of the Cefaclor taken by the formula:

$$(W_S / W_U)(P)(r_U / r_S)$$

in which  $W_S$  and  $W_U$  are the weights, in mg, of USP Cefaclor RS and of Cefaclor taken to prepare the *Standard preparation* and the *Assay preparation*, respectively;  $P$  is the designated potency, in  $\mu\text{g}$  of cefaclor ( $\text{C}_{15}\text{H}_{14}\text{ClN}_3\text{O}_4\text{S}$ ) per mg, of USP Cefaclor RS; and  $r_U$  and  $r_S$  are the peak responses of the cefaclor peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefaclor Capsules

» Cefaclor Capsules contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $\text{C}_{15}\text{H}_{14}\text{ClN}_3\text{O}_4\text{S}$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cefaclor RS

USP Cefaclor Delta-3 Isomer RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 30 minutes.

**Procedure**—Determine the amount of cefaclor ( $\text{C}_{15}\text{H}_{14}\text{ClN}_3\text{O}_4\text{S}$ ) dissolved from UV absorbances at the wavelength of maximum absorbances at about 264 nm of filtered portions of the solution under test, suitably diluted with water, in comparison with a Standard solution having a known concentration of USP Cefaclor RS in the same medium.

**Tolerances**—Not less than 80% (Q) of the labeled amount of cefaclor ( $\text{C}_{15}\text{H}_{14}\text{ClN}_3\text{O}_4\text{S}$ ) is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 8.0%.

**Related compounds**—

**Diluent**—Dissolve 2.4 g of monobasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 2.5.

**Blank solution**—Use the *Diluent*.

**Solution A**—Dissolve 6.9 g of monobasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 4.0.

**Solution B**—Prepare a mixture of *Solution A* and acetonitrile (55:45), degassing for no longer than 2 minutes.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). [NOTE—Reducing the acetonitrile content increases the retention time of cefaclor and increases the resolution between the delta-3 isomer and cefaclor.]

**Standard solution**—Dissolve an accurately weighed quantity of USP Cefaclor RS in *Diluent* to obtain a solution having a known concentration of about 0.05 mg per mL of cefaclor. Sonicate briefly, if necessary, to dissolve, and avoid heating. [NOTE—Use this solution on the day it is prepared.]

**System suitability solution**—Dissolve a quantity of USP Cefaclor, Delta-3 Isomer RS in the *Standard solution* to obtain a solution having a known concentration of about 0.05 mg per mL of the delta-3 isomer.

**Test solution**—Remove as completely as possible the contents of not fewer than 20 Capsules, and mix. Transfer an accurately weighed portion of the combined contents, equivalent to about 50 mg of cefaclor, to a 10-mL volumetric flask. Dissolve in *Diluent*, using brief sonication, if necessary, to achieve dissolution. Avoid heating. Dilute with *Diluent* to volume, mix, and filter. This solution has a nominal concentration of 5 mg per mL based on the label claim. [NOTE—Use this *Test solution* within 3 hours if stored at room temperature, or within 20 hours when stored under refrigeration.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu\text{m}$  packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	95	5	equilibration
0–30	95→75	5→25	linear gradient
30–45	75→0	25→100	linear gradient
45–55	0	100	isocratic
55–60	0→95	100→5	reset composition
60–70	95	5	re-equilibration

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: identify the peaks by their relative retention times, which are about 0.85 and 1.0 for the delta-3 isomer and cefaclor, respectively; the resolution,  $R$ , between the delta-3 isomer and cefaclor is not less than 2.0; and the tailing factor for the cefaclor peak is not more than 1.2. Chromatograph the *Blank solution* as directed for *Procedure*. Examine the chromatogram for any extraneous peaks, and disregard any corresponding peaks observed in the chromatogram of the *Test solution*.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses for all the peaks. Calculate the percentage of each related compound in the portion of Capsules taken by the formula:

$$100(P)(C_S / C_U)(r_i / r_S)$$

in which  $P$  is the potency, in mg of cefaclor, per mg of USP Cefaclor RS;  $C_S$  is the concentration, in mg per mL, of USP Cefaclor RS in the *Standard solution*;  $C_U$  is the nominal concentration, in mg per mL, of cefaclor in the *Test solution*;  $r_i$  is the peak response of an individual related compound in the chromatogram obtained from the *Test solution*; and  $r_S$  is the peak response for the cefaclor peak in the chromatogram of the *Standard solution*. The reporting level for impurities is 0.1%. Not more than 0.5% of any individual related compound is found; and the sum of all related compounds is not more than 2.0%.

**Assay**—

**Mobile phase**—Dissolve 1 g of sodium 1-pentanesulfonate in a mixture of 780 mL of water and 10 mL of triethylamine. Adjust with phosphoric acid to a pH of  $2.5 \pm 0.1$ , add 220 mL of methanol, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cefaclor RS in *Mobile phase* to obtain a solution having a known concentration of about 0.3 mg per mL of cefaclor. Sonicate briefly, if necessary, to achieve dissolution, and avoid heating the solution. [NOTE—Use this

*Standard preparation* within 8 hours if stored at room temperature, or within 20 hours if stored under refrigeration.]

*Assay preparation*—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed portion of the powder, equivalent to about 75 mg of cefaclor, to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Sonicate if necessary to ensure complete dissolution of the cefaclor. Filter to obtain the clear *Assay preparation*. The nominal concentration of this solution is 0.3 mg per mL of cefaclor based on the label claim.

*System suitability solution*—Dissolve accurately weighed quantities of USP Cefaclor RS and USP Cefaclor Delta-3 Isomer RS in *Mobile phase* to obtain a solution having a known concentration of about 0.3 mg each of cefaclor and the delta-3 isomer per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 265-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the responses as directed for *Procedure*: identify the peaks by their relative retention times, which are about 0.8 and 1.0 for cefaclor and the delta-3 isomer, respectively; the resolution, *R*, between the cefaclor peak and the delta-3 isomer peak is not less than 2.5; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2%.

*Procedure*—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percent label claim of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ) in the portion of Capsules taken by the formula:

$$(P)(C_S / C_U)(r_U / r_S)(100)$$

in which *P* is the potency, in mg, of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ) per mg, of USP Cefaclor RS; *C<sub>S</sub>* is the concentration, in mg per mL, of USP Cefaclor RS in the *Standard preparation*; *C<sub>U</sub>* is the nominal concentration, in mg per mL, of cefaclor in the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses of the cefaclor peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefaclor for Oral Suspension

» Cefaclor for Oral Suspension is a dry mixture of Cefaclor and one or more suitable buffers, colors, diluents, and flavors. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{15}H_{14}ClN_3O_4S$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cefaclor RS

USP Cefaclor Delta-3 Isomer RS

**Identification**—The retention time of the major peak for cefaclor in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 2.5 and 5.0, in the suspension constituted as directed in the labeling.

**Water, Method I** (921): not more than 2.0%.

**Related compounds**—

*Solvent, Blank solution, Solution A, Solution B, Mobile phase, Standard solution, System suitability solution, and Chromatographic system*—Proceed as directed for *Related compounds* under Cefaclor.

*Test solution*—Constitute Cefaclor for Oral Suspension as directed in the labeling. Transfer an accurately measured portion of Cefaclor for Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 50 mg of cefaclor, to a 10-mL volumetric flask. Dissolve in *Solvent*, using brief sonication, if necessary, to achieve dissolution. Avoid heating. Dilute with *Solvent* to volume, mix, and filter. Use this *Test solution* within 3 hours if stored at room temperature, or within 20 hours when stored under refrigeration.

*Procedure*—Separately inject equal volumes (about 20 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses for all the peaks. Calculate the mg of each related compound in the portion of Cefaclor for Oral Suspension taken by the formula:

$$0.01CP(r_i / r_S)$$

in which the terms are as defined for *Related compounds* under Cefaclor. Not more than 1.0% of any individual cefaclor-related compound is found; and the sum of all cefaclor-related compounds found is not more than 3.0%, not including the contribution of any peak that gives a result of less than 0.1%.

**Assay**—

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the *Assay* under Cefaclor.

*Assay preparation*—Constitute Cefaclor for Oral Suspension as directed in the labeling. Transfer an accurately measured portion of the resulting suspension, freshly mixed and free from air bubbles, dilute quantitatively with *Mobile phase* to obtain a final solution containing about 0.3 mg of cefaclor per mL. Sonicate if necessary to ensure complete dissolution of the cefaclor. Filter to obtain the clear *Assay preparation*.

*Procedure*—Proceed as directed in the *Assay* under Cefaclor. Calculate the quantity, in mg, of  $C_{15}H_{14}ClN_3O_4S$  in the portion of the constituted Cefaclor for Oral Suspension taken by the formula:

$$V_U(W_S / 50)(P/1000)(r_U / r_S)$$

in which *V<sub>U</sub>* is the final volume, in mL, of the *Assay preparation*, and the other terms are as defined therein.

## Cefaclor Chewable Tablets

» Cefaclor Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ).

**Packaging and storage**—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—The product label and product labeling indicate that the Chewable Tablets must be chewed or crushed before administration.

**USP Reference standards** (11)—

USP Cefaclor RS

USP Cefaclor Delta-3 Isomer RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—*Medium*: water; 900 mL.*Apparatus 2*: 50 rpm.*Time*: 30 minutes.

**Procedure**—Determine the amount of cefaclor dissolved by employing UV absorption at the wavelength of maximum absorbance at about 264 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Cefaclor RS in the same *Medium*. Calculate the amount of cefaclor dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times D \times LC}$$

in which  $A_U$  and  $A_S$  are the absorbances obtained from the solution under test and the Standard solution, respectively;  $C_S$  is the concentration, in mg per mL, of the Standard solution; 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage;  $D$  is the dilution factor of the solution under test; and  $LC$  is the Tablet label claim, in mg.

**Tolerances**—Not less than 80% (Q) of the labeled amount of cefaclor is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water**, *Method I* (921): not more than 5.0%.

**Related compounds**—

*Solvent*, *Blank solution*, *Solution A*, *Solution B*, *Mobile phase*, *Standard solution*, *System suitability solution*, and *Chromatographic system*—Proceed as directed for *Related compounds* under Cefaclor.

**Test solution**—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the composite, equivalent to about 50 mg of cefaclor, to a 10-mL volumetric flask. Dissolve in *Solvent*, using brief sonication, if necessary, to dissolve. Avoid heating. Dilute with *Solvent* to volume, mix, and filter. [NOTE—Use this *Test solution* within 3 hours if stored at room temperature, or within 20 hours when stored under refrigeration.]

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses for all the peaks. Calculate the quantity, in mg, of each related compound in the portion of Chewable Tablets taken by the formula:

$$0.01CP(r_i / r_s)$$

in which the terms are as defined for *Related compounds* under Cefaclor. Not more than 1.0% of any individual cefaclor related compound is found; and the sum of all cefaclor related compounds found is not more than 3.0%, not including the contribution of any peak that gives a result of less than 0.1%.

**Assay**—

*Mobile phase*, *Standard preparation*, *Resolution solution*, and *Chromatographic system*—Proceed as directed in the *Assay* under Cefaclor.

**Assay preparation**—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 mg of cefaclor, to a 250-mL volumetric flask, dilute with *Mobile*

*phase* to volume, and mix. Sonicate, if necessary, to dissolve the cefaclor. Filter to obtain a clear solution.

**Procedure**—Proceed as directed in the *Assay* under Cefaclor. Calculate the quantity, in mg, of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ) in the portion of Chewable Tablets taken by the formula:

$$5W_s(P/1000)(r_U / r_S)$$

in which the terms are as defined therein.

## Cefaclor Extended-Release Tablets

» Cefaclor Extended-Release Tablets contain the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Cefaclor RS

USP Cefaclor Delta-3 Isomer RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—*Medium*: 0.1 N hydrochloric acid; 900 mL.*Apparatus 1* (10-mesh basket): 100 rpm.*Times*: 30, 60, and 240 minutes.

**Procedure**—Quantitatively dilute filtered portions of the solution under test with 0.1 N hydrochloric acid to obtain a test solution having a concentration of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ) estimated to be about 25  $\mu$ g per mL. Determine the amount of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ) dissolved by employing UV absorption at the wavelength of maximum absorbance at about 265 nm, in comparison with a Standard solution having a similar, known concentration of USP Cefaclor RS in the same *Medium*.

**Tolerances**—The percentages of the labeled amount of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ) dissolved at the times specified conform to *Acceptance Table 2*.

Time (minutes)	Amount dissolved
30	between 5% and 30%
60	between 20% and 50%
240	not less than 80%

**Uniformity of dosage units** (905): meet the requirements.

**Water**, *Method I* (921): not more than 7.0%.

**Related compounds**—

*Solvent*, *Blank solution*, *Solution A*, *Solution B*, *Mobile phase*, *Standard solution*, *System suitability solution*, and *Chromatographic system*—Proceed as directed for *Related compounds* under Cefaclor.

**Test solution**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the composite, equivalent to about 50 mg of cefaclor, to a 10-mL volumetric flask. Dissolve in *Solvent*, using brief sonication, if necessary, to achieve dissolution. Avoid heating. Dilute with *Solvent* to volume, mix, and filter. Use this *Test solution* within 3 hours if stored at room temperature, or within 20 hours when stored under refrigeration.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak area responses for all the peaks. Calculate the mg of each related compound in the portion of Tablets taken by the formula:

$$0.01CP(r_i / r_s)$$

in which the terms are as defined for *Related compounds* under *Cefaclor*. Not more than 0.6% of any individual cefaclor-related compound is found; and the sum of all cefaclor-related compounds found is not more than 2.0%, not including the contribution of any peak that gives a result of less than 0.1%.

#### Assay—

**Mobile phase, Standard preparation, Resolution solution, and Chromatographic system**—Proceed as directed in the *Assay* under *Cefaclor*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 mg of cefaclor, to a 250-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Sonicate, if necessary, to dissolve the cefaclor. Filter to obtain a clear solution.

**Procedure**—Proceed as directed in the *Assay* under *Cefaclor*. Calculate the quantity, in mg, of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ) in the portion of Tablets taken by the formula:

$$5W_5(P/1000)(r_U / r_S)$$

in which the terms are as defined therein.

## Cefadroxil

$C_{16}H_{17}N_3O_5S \cdot H_2O$  381.40

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[amino(4-hydroxyphenyl)acetyl]amino]-3-methyl-8-oxo-, monohydrate [6R-[6 $\alpha$ ,7 $\beta$ (R\*)]]-

(6R,7R)-7-[(R)-2-Amino-2-(p-hydroxyphenyl)acetamido]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monohydrate [66592-87-8].

Hemihydrate 372.39 [119922-85-9].

Anhydrous 363.40 [50370-12-2].

» Cefadroxil has a potency equivalent to not less than 950  $\mu$ g and not more than 1050  $\mu$ g of  $C_{16}H_{17}N_3O_5S$  per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The hemihydrate form is so labeled.

**USP Reference standards** (11)—

USP Cefadroxil RS

**Identification**—

**A: Infrared Absorption** (197K).

**B:** Place a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of binder-free silica gel in a chamber containing a mixture of *n*-hexane and tetradecane (95:5) to a depth of about 1 cm, allow the solvent front to move the length of the plate, remove the plate from the chamber, and allow the solvent

to evaporate. Apply 20  $\mu$ L each of a solution of Cefadroxil in water containing 2 mg per mL and a similarly prepared *Standard solution* of USP Cefadroxil RS to this plate. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of 0.1 M citric acid, 0.1 M dibasic sodium phosphate, and a 1 in 15 solution of ninhydrin in acetone (60:40:1.5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow to air-dry. Spray the plate with a 1 in 500 solution of ninhydrin in dehydrated alcohol [NOTE—Protect this solution from light], dry for 10 minutes at 110°, and examine the chromatogram: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the *Standard solution*.

**Specific rotation** (781S): between +165.0° and +178.0°.

**Test solution:** 10 mg per mL, in water.

**Crystallinity** (695): meets the requirements.

**pH** (791): between 4.0 and 6.0, in a suspension containing 50 mg per mL.

**Water, Method I** (921): between 4.2% and 6.0%, except that where it is labeled as being in the hemihydrate form it is between 2.4% and 4.5%.

**Chromatographic purity**—

**Adsorbent:** a 0.25-mm layer of chromatographic silica gel mixture.

**Solvent**—Prepare a mixture of alcohol, water, and 2.4 N hydrochloric acid (75:22:3).

**Test solution**—Prepare a solution of Cefadroxil in *Solvent* containing 25 mg per mL.

**Standard solution 1**—Dilute 1.0 mL of the *Test solution* with *Solvent* to 100 mL, and mix.

**Standard solution 2**—Prepare a solution in *Solvent* containing 0.25 mg each of 7-aminodesacetoxycephalosporanic acid and D- $\alpha$ -4-hydroxyphenylglycine per mL.

**Standard solution 3**—Prepare a solution in *Solvent* containing 0.25 mg of D- $\alpha$ -4-hydroxyphenylglycine per mL.

**Resolution solution**—Mix 1.0 mL of the *Test solution* and 1.0 mL of *Standard solution 2*.

**Developing solvent system:** a mixture of ethyl acetate, alcohol, water, and formic acid (14:5:5:1).

**Procedure**—Apply separate 2- $\mu$ L portions of the *Test solution*, *Standard solution 1*, *Standard solution 2*, and *Standard solution 3*, and a 4- $\mu$ L portion of the *Resolution solution* to a suitable thin-layer chromatographic plate (see *Thin-Layer Chromatography* under *Chromatography* (621)), and develop the chromatograms until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow the plate to dry, and examine the chromatograms under short-wavelength UV light: any secondary spot in the chromatogram obtained from the *Test solution* corresponding to 7-aminodesacetoxycephalosporanic acid or D- $\alpha$ -4-hydroxyphenylglycine is not more intense than the corresponding spot in the chromatogram obtained from *Standard solution 2* (1.0%); and any spot, other than the principal spot and any spot corresponding to 7-aminodesacetoxycephalosporanic acid or D- $\alpha$ -4-hydroxyphenylglycine, is not more intense than the principal spot in the chromatogram obtained from *Standard solution 1* (1.0%). In a valid test, the chromatogram obtained from the *Resolution solution* shows three clearly separated spots.

**Dimethylaniline** (223): meets the requirement.

**Assay**—

**pH 5.0 Buffer**—Dissolve 13.6 g of monobasic potassium phosphate in water to make 2000 mL of solution. Adjust with 10 N potassium hydroxide to a pH of 5.0, and mix.

**Mobile phase**—Prepare a suitable mixture of *pH 5.0 Buffer* and acetonitrile (960:40), and pass through a filter having a 0.5- $\mu$ m or finer porosity. Make adjustments if necessary (see

*System Suitability* under *Chromatography* (621)). Increasing the acetonitrile content of the *Mobile phase* decreases the retention time of cefadroxil, and decreasing the acetonitrile content increases the retention time.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cefadroxil RS in *pH 5.0 Buffer* to obtain a solution having a known concentration of about 1.06 mg per mL. This solution contains the equivalent of about 1000 µg of cefadroxil ( $C_{16}H_{17}N_3O_5S$ ) per mL. Use this solution on the day prepared.

**Assay preparation**—Transfer about 212 mg of Cefadroxil, accurately weighed, to a 200-mL volumetric flask, dilute with *pH 5.0 Buffer* to volume, and stir by mechanical means for 5 minutes until dissolved. Use this solution on the day prepared.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the capacity factor,  $k'$ , is between 2.0 and 3.5; the column efficiency determined from the analyte peak is not less than 1800 theoretical plates; the tailing factor for the analyte peak is not more than 2.2; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of cefadroxil ( $C_{16}H_{17}N_3O_5S$ ) in each mg of the Cefadroxil taken by the formula:

$$200(CE/W)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Cefadroxil RS taken to prepare the *Standard preparation*;  $E$  is the cefadroxil equivalent, in µg per mg, of USP Cefadroxil RS;  $W$  is weight, in mg, of the portion of Cefadroxil taken; and  $r_U$  and  $r_S$  are the cefadroxil peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefadroxil Capsules

» Cefadroxil Capsules contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{16}H_{17}N_3O_5S$ .

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Capsules prepared using the hemihydrate form of Cefadroxil are so labeled.

**USP Reference standards** (11)—  
USP Cefadroxil RS

**Identification**—Mix the contents of 1 Capsule with water to obtain a concentration of about 2 mg of cefadroxil per mL, and filter: the filtrate so obtained responds to *Identification test B* under *Cefadroxil*.

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 30 minutes.

**Procedure**—Determine the amount of  $C_{16}H_{17}N_3O_5S$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 263 nm of filtered portions of the solution under test, suitably diluted with water if necessary, in

comparison with a Standard solution having a known concentration of USP Cefadroxil RS in the same medium.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{16}H_{17}N_3O_5S$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 7.0%.

**Assay**—

*pH 5.0 Buffer, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Cefadroxil*.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 10 Capsules, and weigh. Mix, and transfer an accurately weighed portion of the powder, equivalent to about 200 mg of cefadroxil, to a 200-mL volumetric flask, dilute with *pH 5.0 Buffer* to volume, and stir by mechanical means for 5 minutes. Use this solution on the day prepared.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Cefadroxil*. Calculate the quantity, in mg, of  $C_{16}H_{17}N_3O_5S$  in the portion of Capsules contents taken by the formula:

$$0.2CE(r_U / r_S)$$

in which the terms are as defined therein.

## Cefadroxil for Oral Suspension

### DEFINITION

Cefadroxil for Oral Suspension is a dry mixture of Cefadroxil and one or more suitable buffers, colors, diluents, and flavors. It contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of  $C_{16}H_{17}N_3O_5S$ .

### IDENTIFICATION

#### • THIN-LAYER CHROMATOGRAPHY

**Standard solution**: 2 mg/mL of USP Cefadroxil RS

**Sample solution**: Constitute 1 container of Cefadroxil for Oral Suspension as directed in the labeling. Dilute a portion of the resulting suspension with water to a concentration of 2 mg/mL. Pass through a suitable filter.

**Chromatographic system**

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode**: TLC

**Adsorbent**: 0.25-mm layer of binder-free silica gel

**Application volume**: 20 µL

**Pre-developing solvent system**: *n*-Hexane and tetradecane (95:5)

**Solution A**: 1 in 15 solution of ninhydrin in acetone

**Developing solvent system**: 0.1 M citric acid, 0.1 M dibasic sodium phosphate, and *Solution A* (60:40:15)

**Spray reagent**: 1 in 500 solution of ninhydrin in dehydrated alcohol. Protect this solution from light.

**Analysis**

**Samples**: *Standard solution* and *Sample solution*

Place the thin-layer chromatographic plate in a chamber containing the *Pre-developing solvent system* and allow the solvent front to move the length of the plate. Remove the plate from the chamber and allow the solvent to evaporate. Apply the *Sample solution* and *Standard solution* to the plate, allow the spots to dry, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow to air-dry. Spray the plate with the *Spray reagent*, dry for 10 min at 110°, and examine the chromatogram.

**Acceptance criteria:** The  $R_F$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

## ASSAY

### • PROCEDURE

**Buffer:** 6.86 g/L of monobasic potassium phosphate. Adjust with 10 N potassium hydroxide to a pH of 5.0.

**Mobile phase:** Acetonitrile and *Buffer* (40:960)

**Standard solution:** 1.06 mg/mL of USP Cefadroxil RS in *Buffer*. Use this solution on the day prepared. [NOTE—This solution contains the equivalent of 1 mg/mL of cefadroxil ( $C_{16}H_{17}N_3O_5S$ ).]

**Sample solution:** Constitute a container of Cefadroxil for Oral Suspension as directed in the labeling. Dilute a portion of the resulting suspension with *Buffer* to prepare a solution containing nominally 1 mg/mL. Pass through a suitable filter of 0.8- $\mu$ m or finer pore size, and use the filtrate. Use this solution on the day prepared.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4-mm  $\times$  25-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Capacity factor,  $k'$ :** 2.0–3.5

**Column efficiency:** NLT 1800 theoretical plates

**Tailing factor:** NMT 2.2

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of cefadroxil ( $C_{16}H_{17}N_3O_5S$ ) in the portion of Cefadroxil for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of cefadroxil from the *Sample solution*

$r_S$  = peak response of cefadroxil from the *Standard solution*

$C_S$  = concentration of USP Cefadroxil RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cefadroxil in the *Sample solution* (mg/mL)

$P$  = potency of cefadroxil in USP Cefadroxil RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–120.0%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

**Medium:** Water; 900 mL

**Apparatus 2:** 25 rpm

**Time:** 30 min

**Standard solution:** USP Cefadroxil RS in *Medium* at a known concentration

**Sample solution:** Transfer 5.0 mL of the constituted Cefadroxil for Oral Suspension (weighed) to the dissolution vessel.

**Analysis:** Determine the amount of cefadroxil dissolved by employing UV absorption at the wavelength of 263 nm on the *Sample solution* in comparison with the *Standard solution*.

Calculate the amount of cefadroxil dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/D) \times V$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$V$  = volume of *Medium*, 900 mL

$D$  = dilution factor

**Tolerances:** NLT 75% (Q) of the labeled amount of cefadroxil is dissolved.

### • UNIFORMITY OF DOSAGE UNITS <905>

**For solid packaged in single-unit containers:** Meets the requirements

### • DELIVERABLE VOLUME <698>: Meets the requirements

## SPECIFIC TESTS

• **pH <791>:** 4.5–6.0, in the suspension constituted as directed in the labeling

• **WATER DETERMINATION, Method I <921>:** NMT 2.0%, except where it is labeled as containing 100 mg of cefadroxil per mL after constitution, in which case the limit is NMT 3.0%

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS <11>**  
USP Cefadroxil RS

## Cefadroxil Tablets

» Cefadroxil Tablets contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{16}H_{17}N_3O_5S$ .

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The Tablets prepared using the hemihydrate form of Cefadroxil are so labeled.

**USP Reference standards <11>**—  
USP Cefadroxil RS

**Identification**—Mix a quantity of powdered Tablets, equivalent to about 250 mg of cefadroxil, with water to obtain a concentration of about 2 mg of cefadroxil per mL, and filter: the filtrate so obtained responds to *Identification test B* under *Cefadroxil*.

### Dissolution <711>—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

**Procedure**—Determine the amount of  $C_{16}H_{17}N_3O_5S$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 263 nm of filtered portions of the solution under test, suitably diluted with water if necessary, in comparison with a *Standard solution* having a known concentration of USP Cefadroxil RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{16}H_{17}N_3O_5S$  is dissolved in 30 minutes.

**Uniformity of dosage units <905>:** meet the requirements.

**Water, Method I <921>:** not more than 8.0%.

### Assay—

*pH 5.0 Buffer, Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay under Cefadroxil*.

**Assay preparation**—Weigh and finely powder not fewer than 10 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg of cefadroxil, to a 200-mL volumetric flask, dilute with *pH 5.0 Buffer* to volume, and stir by mechanical means for 5 minutes. Use this solution on the day prepared.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Cefadroxil*. Calculate the quantity, in mg, of  $C_{16}H_{17}N_3O_5S$  in the portion of Tablets taken by the formula:

$$0.2CE(r_U / r_S)$$

in which the terms are as defined therein.

## Cefamandole Nafate

$C_{19}H_{17}N_6NaO_6S_2$  512.49  
 5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[(formyloxy)phenylacetyl]amino]-3-[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-, monosodium salt, [6R-[6 $\alpha$ ,7 $\beta$ (R\*)]]-;  
 Sodium (6R,7R)-7-(R)-mandelamido-3-[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate formate (ester) [42540-40-9].

### DEFINITION

Cefamandole Nafate has a potency equivalent to NLT 810  $\mu$ g/mg and NMT 1000  $\mu$ g/mg of cefamandole ( $C_{18}H_{18}N_6O_5S_2$ ), calculated on the anhydrous basis.

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 10% solution of triethylamine in water, adjusted with phosphoric acid to a pH of 2.5

**Mobile phase:** Acetonitrile and *Buffer* (25:75)

**Standard solution:** 0.5 mg/mL of USP Cefamandole Nafate RS in *Mobile phase*. Use this solution immediately after it is prepared.

**System suitability solution:** 0.05 mg/mL of USP Cefamandole Nafate RS in *Mobile phase*. Heat at 60° for 30 min.

**Sample solution:** 0.5 mg/mL of Cefamandole Nafate in *Mobile phase*. Use this solution immediately after it is prepared.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 7.0 between the two main peaks, *System suitability solution*

**Relative standard deviation:** NMT 0.8% for the cefamandole peak, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the concentration, in  $\mu$ g/mg, of cefamandole ( $C_{18}H_{18}N_6O_5S_2$ ) in the portion of Cefamandole Nafate taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times (M_{r1} / M_{r2}) \times P \times F$$

- $r_U$  = sum of the peak responses of cefamandole and cefamandole nafate from the *Sample solution*
  - $r_S$  = sum of the peak responses of cefamandole and cefamandole nafate from the *Standard solution*
  - $C_S$  = concentration of USP Cefamandole Nafate RS in the *Standard solution* (mg/mL)
  - $C_U$  = concentration of the *Sample solution* (mg/mL)
  - $M_{r1}$  = molecular weight of cefamandole, 462.50
  - $M_{r2}$  = molecular weight of cefamandole nafate, 512.49
  - $P$  = potency of cefamandole nafate in USP Cefamandole Nafate RS (mg/mg)
  - $F$  = conversion factor, 1000  $\mu$ g/mg
- Acceptance criteria:** 810–1000  $\mu$ g/mg on the anhydrous basis

### SPECIFIC TESTS

#### PH <791>

**Sample solution:** 100 mg/mL

**Acceptance criteria:** 3.5–7.0

#### WATER DETERMINATION, Method I <921>

**Acceptance criteria:** NMT 2.0%

#### BACTERIAL ENDOTOXINS TEST (85)

NMT 0.15 USP Endotoxin Unit/mg of cefamandole, when the label states that Cefamandole Nafate is sterile or must be subjected to further processing during the preparation of injectable dosage forms

#### STERILITY TESTS <71>

Meets the requirements for *Test for Sterility of the Product to Be Examined, Membrane Filtration* when the label states that Cefamandole Nafate is sterile

### ADDITIONAL REQUIREMENTS

 USP Endotoxin RS

## Cefamandole Nafate for Injection

### DEFINITION

Cefamandole Nafate for Injection is a sterile mixture of Cefamandole Nafate and one or more suitable buffers. It has a potency equivalent to NLT 810  $\mu$ g/mg and NMT 1000  $\mu$ g/mg of cefamandole ( $C_{18}H_{18}N_6O_5S_2$ ), calculated on the anhydrous and sodium carbonate-free basis. It contains the equivalent of NLT 90.0% and NMT 115.0% of the labeled amount of cefamandole ( $C_{18}H_{18}N_6O_5S_2$ ).

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 10% solution of triethylamine in water, adjusted with phosphoric acid to a pH of 2.5

**Mobile phase:** Acetonitrile and *Buffer* (25:75)

**Standard solution:** 0.5 mg/mL of USP Cefamandole Nafate RS in *Mobile phase*. Use this solution immediately after it is prepared.

**System suitability solution:** 0.05 mg/mL of USP Cefamandole Nafate RS in *Mobile phase*. Heat at 60° for 30 min.

**Sample solution:** Equivalent to 0.5 mg/mL of cefamandole nafate from Cefamandole Nafate for Injection

in *Mobile phase*. Use this solution immediately after it is prepared.

**Sample solution 1** (where the article is represented as being in a single-dose container): Equivalent to 0.5 mg/mL of cefamandole nafate from Cefamandole Nafate for Injection in *Mobile phase* prepared as follows. Constitute a container of Cefamandole Nafate for Injection in a volume of *Mobile phase* corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute with *Mobile phase*.

**Sample solution 2** (where the label states the quantity of cefamandole in a given volume of constituted solution): Equivalent to 0.5 mg/mL of cefamandole nafate from Cefamandole Nafate for Injection in *Mobile phase* prepared as follows. Constitute Cefamandole Nafate for Injection in a volume of *Mobile phase* corresponding to the volume of solvent specified in the labeling. Dilute a volume of the constituted solution with *Mobile phase*.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 20 μL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 7.0 between the two main peaks, *System suitability solution*

**Relative standard deviation:** NMT 0.8% for the cefamandole peak, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution 1* or *Sample solution 2*

Calculate the percentage of the labeled amount of cefamandole (C<sub>18</sub>H<sub>18</sub>N<sub>6</sub>O<sub>5</sub>S<sub>2</sub>) in the portion of constituted solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times P \times 100$$

$r_U$  = sum of the peak responses of cefamandole and cefamandole nafate from *Sample solution 1* or *Sample solution 2*

$r_S$  = sum of the peak responses of cefamandole and cefamandole nafate from the *Standard solution*

$C_S$  = concentration of USP Cefamandole Nafate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cefamandole in *Sample solution 1* or in *Sample solution 2* (mg/mL)

$M_{r1}$  = molecular weight of cefamandole, 462.50

$M_{r2}$  = molecular weight of cefamandole nafate, 512.49

$P$  = potency of USP Cefamandole Nafate RS (mg/mg)

Calculate the potency, in μg/mg, of cefamandole (C<sub>18</sub>H<sub>18</sub>N<sub>6</sub>O<sub>5</sub>S<sub>2</sub>) in the portion of Cefamandole Nafate for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times P \times F$$

$r_U$  = sum of the peak responses of cefamandole and cefamandole nafate from *Sample solution 1* or *Sample solution 2*

$r_S$  = sum of the peak responses of cefamandole and cefamandole nafate from the *Standard solution*

$C_S$  = concentration of USP Cefamandole Nafate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cefamandole in *Sample solution 1* or *Sample solution 2* (mg/mL)

$M_{r1}$  = molecular weight of cefamandole, 462.50

$M_{r2}$  = molecular weight of cefamandole nafate, 512.49

$P$  = potency of USP Cefamandole Nafate RS (mg/mg)

$F$  = conversion factor, 1000 μg/mg

**Acceptance criteria:** 810–1000 μg/mg of C<sub>18</sub>H<sub>18</sub>N<sub>6</sub>O<sub>5</sub>S<sub>2</sub>, calculated on the anhydrous and sodium carbonate-free basis; 90.0%–115.0% of the labeled amount of C<sub>18</sub>H<sub>18</sub>N<sub>6</sub>O<sub>5</sub>S<sub>2</sub>

#### PERFORMANCE TESTS

##### • UNIFORMITY OF DOSAGE UNITS (905)

**Procedure for content uniformity:** Perform the *Assay* on individual containers using *Sample solution 1* or *Sample solution 2*, or both, as appropriate.

**Acceptance criteria:** Meets the requirements

#### SPECIFIC TESTS

• **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections* <1>, *Constituted Solutions*.

• **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.15 USP Endotoxin Unit/mg of cefamandole

• **STERILITY TESTS (71):** It meets the requirements for *Test for Sterility of the Product to Be Examined*, *Membrane Filtration*.

• **PH (791)**

**Sample solution:** 100 mg/mL

**Acceptance criteria:** 6.0–8.0, determined after 30 min

• **PARTICULATE MATTER (788):** Meets the requirements for small-volume injections

• **WATER DETERMINATION, Method I (921):** NMT 3.0%

• **OTHER REQUIREMENTS:** It meets the requirements under *Injections* <1>.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in *Containers for Sterile Solids* as described under *Injections* <1>.

• **USP REFERENCE STANDARDS (11)**

USP Cefamandole Nafate RS

USP Endotoxin RS

## Cefazolin

C<sub>14</sub>H<sub>14</sub>N<sub>8</sub>O<sub>4</sub>S<sub>3</sub> 454.51

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 3-[[[(5-methyl-1,3,4-thiadiazol-2-yl)thio]methyl]-8-oxo-7-[[1*H*-tetrazol-1-yl)acetyl]amino]-, (6*R*-*trans*).

(6*R*,7*R*)-3-[[[(5-methyl-1,3,4-thiadiazol-2-yl)thio]methyl]-8-oxo-7-[2-(1*H*-tetrazol-1-yl)acetamido]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid [25953-19-9].

» Cefazolin contains not less than 95.0 percent and not more than 103.0 percent of C<sub>14</sub>H<sub>14</sub>N<sub>8</sub>O<sub>4</sub>S<sub>3</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Cefazolin RS

**Identification**—The retention time of the major peak for cefazolin in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water**, Method I (921): not more than 2.0%.

**Heavy metals**, Method II (231): 0.002%.

**Assay—**

*pH 3.6 Buffer*—Dissolve 0.900 g of anhydrous dibasic sodium phosphate and 1.298 g of citric acid monohydrate in water to make 1000 mL.

*pH 7.0 Buffer*—Dissolve 5.68 g of anhydrous dibasic sodium phosphate and 3.63 g of monobasic potassium phosphate in water to make 1000 mL.

*Mobile phase*—Prepare a suitable mixture of *pH 3.6 Buffer* and acetonitrile (9:1). Pass through a membrane filter having a 10- $\mu$ m or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Transfer 750 mg of salicylic acid to a 100-mL volumetric flask, dissolve in 10 mL of methanol, dilute with *pH 7.0 Buffer* to volume, and mix.

*Standard preparation*—Transfer about 25 mg of USP Cefazolin RS, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with *pH 7.0 Buffer* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *pH 7.0 Buffer* to volume, and mix.

*Assay preparation*—Proceed as directed for *Standard preparation*, except to use about 25 mg of Cefazolin, accurately weighed.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.0-mm  $\times$  30-cm column that contains 10- $\mu$ m packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for salicylic acid and 1.0 for cefazolin; the resolution, *R*, between the analyte and internal standard peaks is not less than 4.0; the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{14}H_{13}N_8O_4S_3$  in the portion of Cefazolin taken by the formula:

$$500C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Cefazolin RS, calculated on the anhydrous basis, in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios of cefazolin to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefazolin Sodium

$C_{14}H_{13}N_8NaO_4S_3$  476.49  
5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 3-[[[(5-methyl-1,3,4-thiadiazol-2-yl)thio]methyl]-8-oxo-7-[[[(1H-tetrazol-1-yl)acetyl]amino]-, monosodium salt (6*R-trans*);  
Monosodium (6*R,7R*)-3-[[[(5-methyl-1,3,4-thiadiazol-2-yl)thio]methyl]-8-oxo-7-[2-(1H-tetrazol-1-yl)acetamido]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [27164-46-1].

### DEFINITION

Cefazolin Sodium has a potency equivalent to NLT 89.1% and NMT 110.1% of cefazolin sodium ( $C_{14}H_{13}NaN_8O_4S_3$ ), calculated on the anhydrous basis.

### IDENTIFICATION

**A. ULTRAVIOLET ABSORPTION (197U)**

**Sample solution:** 20  $\mu$ g/mL in 0.1 M sodium bicarbonate

**Acceptance criteria:** Meets the requirements

**B.** The retention time of the major peak for cefazolin in the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**C. IDENTIFICATION TESTS—GENERAL, Sodium (191):** Meets the requirements

### ASSAY

**PROCEDURE**

**Buffer A:** 0.9 g/L of anhydrous dibasic sodium phosphate and 1.298 g/L of citric acid monohydrate in water

**Buffer B:** 5.68 g/L of anhydrous dibasic sodium phosphate and 3.63 g/L of monobasic potassium phosphate in water

**Mobile phase:** Acetonitrile and *Buffer A* (1:9). Pass through a membrane filter having a 10- $\mu$ m or finer pore size.

**Internal standard solution:** 7.5 mg/mL of salicylic acid in methanol and *Buffer B* (1:9). Dissolve first in methanol, using 10% of the final volume, and dilute with water to volume.

**Standard stock solution:** 1 mg/mL of USP Cefazolin RS in *Buffer B*

**Standard solution:** 50  $\mu$ g/mL of cefazolin from the *Standard stock solution* and 0.4 mg/mL of salicylic acid from the *Internal standard solution* in *Buffer B*

**Sample stock solution:** 1 mg/mL of Cefazolin Sodium in *Buffer B*

**Sample solution:** 50  $\mu$ g/mL of cefazolin sodium from the *Sample stock solution* and 0.4 mg/mL of salicylic acid from the *Internal standard solution* in *Buffer B*

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.0-mm  $\times$  30-cm; 10- $\mu$ m packing L1

**Flow rate:** 2 mL/min

**Injection size:** 10  $\mu$ L

### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for salicylic acid and cefazolin are about 0.7 and 1.0, respectively.]

### Suitability requirements

**Resolution:** NLT 4.0 between the analyte and the internal standard peaks

**Column efficiency:** NLT 1500 theoretical plates

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of cefazolin sodium ( $C_{14}H_{13}N_8NaO_4S_3$ ) in the portion of Cefazolin Sodium taken:

$$\text{Result} = (R_U / R_S) \times (C_S / C_U) \times (M_{r1} / M_{r2}) \times 100$$

*R<sub>U</sub>* = peak response ratio of cefazolin to the internal standard from the *Sample solution*

*R<sub>S</sub>* = peak response ratio of cefazolin to the internal standard from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Cefazolin RS, calculated on the anhydrous basis, in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = nominal concentration of Cefazolin Sodium in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of cefazolin sodium, 476.49  
 $M_{r2}$  = molecular weight of cefazolin, 454.51  
**Acceptance criteria:** 89.1%–110.1% on the anhydrous basis

**IMPURITIES****• ORGANIC IMPURITIES**

[NOTE—Use the *Sample solution* immediately after preparation.]

**Buffer A:** 6.8 g/L of monobasic potassium phosphate  
**Solution B:** 6.8 g/L of monobasic potassium phosphate adjusted with 10% sodium hydroxide to a pH of 6.8 before final dilution  
**Solution C:** Acetonitrile and *Buffer A* (1:1)  
**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution B (%)	Solution C (%)
0	98	2
7	98	2
15	85	15
30	80	20
35	80	20
45	50	50
50	50	50
55	98	2
65	98	2

**Blank:** Use *Solution B*.

**System suitability stock solution:** 2 mg/mL of USP Cefazolin RS in 0.05 M sodium hydroxide. Set the solution aside at room temperature for 5 min. [NOTE—The cefazolin epimer is formed upon treatment of cefazolin with sodium hydroxide.]

**System suitability solution:** *System suitability stock solution* and *Buffer B* (1:24)

**Standard solution:** 25 µg/mL of USP Cefazolin RS in *Solution B*

**Sample solution:** 2.5 mg/mL of Cefazolin Sodium in *Solution B*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 and 254 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Temperature:** 30°

**Flow rate:** 1.5 mL/min

**Injection size:** 20 µL

**System suitability**

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 8.0 between cefazolin and cefazolin epimer, 254 nm

**Analysis**

**Samples:** *Blank*, *Standard solution*, and *Sample solution*  
 Calculate the percentage of tetrazolylacetic acid and tetrazolylacetamide acetal in the portion of Cefazolin Sodium taken:

$$\text{Result} = (r_{U(210)}/r_{S(254)}) \times (C_S/C_U) \times (1/F) \times 100$$

$r_{U(210)}$  = peak response of tetrazolylacetic acid or tetrazolylacetamide acetal at 210 nm from the *Sample solution*

$r_{S(254)}$  = peak response of cefazolin at 254 nm from the *Standard solution*

$C_S$  = concentration of USP Cefazolin RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Cefazolin Sodium in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 2*)

**Table 2**

Name	Analytical Wavelength (nm)	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Tetrazolylacetic acid <sup>a</sup>	210	0.07	0.40	1.0
Tetrazolylacetamide acetal <sup>b</sup>	210	0.08	0.33	1.0
<sup>c</sup> Cefazolin open-ring lactone <sup>d</sup> or Cefazolin 3-hydroxy-methyl <sup>e</sup>	254	0.20	1.0	0.5

<sup>l</sup> Three isomers of this impurity may not be fully resolved by this method. The limit applies to the sum of the isomers, which are as follows:

Cefazolin open-ring delta-3: (2*R*)-2-[(*R*)-[2-(1*H*-Tetrazol-1-yl)acetamido](carboxy)methyl]-5-[(5-methyl-1,3,4-thiadiazol-2-ylthio)methyl]-3,6-dihydro-2*H*-1,3-thiazine-4-carboxylic acid.

Cefazolin open-ring delta-2: (2*R*)-2-[(*R*)-[2-(1*H*-Tetrazol-1-yl)acetamido](carboxy)methyl]-5-[(5-methyl-1,3,4-thiadiazol-2-ylthio)methyl]-3,4-dihydro-2*H*-1,3-thiazine-4-carboxylic acid.

Cefazolin open-ring delta-4: (2*R*)-2-[(*R*)-[2-(1*H*-Tetrazol-1-yl)acetamido](carboxy)methyl]-5-[(5-methyl-1,3,4-thiadiazol-2-ylthio)methyl]-5,6-dihydro-2*H*-1,3-thiazine-4-carboxylic acid.

<sup>m</sup> (6*R*,7*S*)-7-[2-(1*H*-Tetrazol-1-yl)acetamido]-3-[(5-methyl-1,3,4-thiadiazol-2-ylthio)methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid.

<sup>n</sup> (6*R*,7*R*)-3-[(5-Methyl-1,3,4-thiadiazol-2-ylthio)methyl]-8-oxo-7-pivalamido-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid.

Calculate the percentage of each impurity other than tetrazolylacetic acid and tetrazolylacetamide acetal in the portion of Cefazolin Sodium taken:

$$\text{Result} = (r_{U(254)} / r_{S(254)}) \times (C_S / C_U) \times (1/F) \times 100$$

$r_{U(254)}$  = peak response of each impurity other than tetrazolylacetic acid and tetrazolylacetamide acetal at 254 nm from the *Sample solution*

$r_{S(254)}$  = peak response of cefazolin at 254 nm from the *Standard solution*

$C_S$  = concentration of USP Cefazolin RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Cefazolin Sodium in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 2*)

**Acceptance criteria:** See *Table 2*. Disregard peaks corresponding to those in the *Blank*.

## SPECIFIC TESTS

### • OPTICAL ROTATION, *Specific Rotation* (781S)

**Sample solution:** 55 mg/mL, in 0.1 M sodium bicarbonate

**Acceptance criteria:**  $-10^\circ$  to  $-24^\circ$

### • pH (791): 4.0–6.0, in a solution containing 100 mg/mL of cefazolin

### • WATER DETERMINATION, *Method I* (921): NMT 6.0%

### • STERILITY TESTS (71): Where the label states that Cefazolin Sodium is sterile, it meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

### • BACTERIAL ENDOTOXINS TEST (85): Where the label states that Cefazolin Sodium is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.15 USP Endotoxin Unit/mg of cefazolin.

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in tight containers.

### • LABELING: Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

## • USP REFERENCE STANDARDS (11)

USP Cefazolin RS

USP Endotoxin RS

## Cefazolin Injection

» Cefazolin Injection is a sterile solution of Cefazolin and Sodium Bicarbonate in a diluent containing one or more suitable tonicity-adjusting agents. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of cefazolin ( $C_{14}H_{14}N_8O_4S_3$ ).

**Packaging and storage**—Preserve in *Containers for Injections* as described under *Injections* (1). Maintain in the frozen state.

**Labeling**—It meets the requirements for *Labeling* under *Injections* (1). The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

### USP Reference standards (11)—

USP Cefazolin RS

USP Endotoxin RS

**Identification**—The retention time of the major peak for cefazolin in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.15 USP Endotoxin Unit per mg of cefazolin.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to Be Examined*.

**pH** (791): between 4.5 and 7.0.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Assay—**

*pH 3.6 Buffer, pH 7.0 Buffer, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under *Cefazolin*.

*Assay preparation*—Allow 1 container of Injection to thaw, and mix. Transfer an accurately measured volume of the Injection, equivalent to about 50 mg of cefazolin, to a 50-mL volumetric flask, dilute with *pH 7.0 Buffer* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *pH 7.0 Buffer* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Cefazolin*. Calculate the quantity, in mg, of cefazolin ( $C_{14}H_{14}N_8O_4S_3$ ) in each mL of the Injection taken by the formula:

$$(1000C / V)(R_U / R_S)$$

in which *V* is the volume, in mL, of Injection taken, and the other terms are as defined therein.

## Cefazolin for Injection

» Cefazolin for Injection contains an amount of Cefazolin Sodium equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of cefazolin ( $C_{14}H_{14}N_8O_4S_3$ ).

**Packaging and storage**—Preserve in *Containers for Injections* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Cefazolin RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Identification—**

**A:** *Ultraviolet Absorption* (197U)—

*Solution:* 20 µg per mL.

*Medium:* 0.1 M sodium bicarbonate.

**B:** The retention time of the major peak for cefazolin in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** It meets the requirements of the tests for *Sodium* (191).

**Specific rotation** (781S): between  $-10^\circ$  and  $-24^\circ$ .

*Test solution:* 55 mg per mL, in 0.1 M sodium bicarbonate.

**Bacterial endotoxins** (85)—It contains not more than 0.15 USP Endotoxin Unit per mg of cefazolin.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Uniformity of dosage units** (905): meets the requirements.

*Procedure for content uniformity*—Perform the Assay on individual containers using *Assay preparation 1* or *Assay preparation 2*, or both, as appropriate.

**pH** (791): between 4.0 and 6.0, in a solution containing 100 mg of cefazolin per mL.

**Water, Method I** (921): not more than 6.0%.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements for *Labeling* under *Injections* (1).

**Assay—**

*pH 3.6 Buffer, pH 7.0 Buffer, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under *Cefazolin*.

*Assay preparation 1* (where it is packaged for dispensing and is represented as being in a single-dose container)—Constitute Cefazolin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with *pH 7.0 buffer* to obtain a stock solution containing about 1 mg of cefazolin per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *pH 7.0 buffer* to volume, and mix.

*Assay preparation 2* (where the label states the quantity of cefazolin in a given volume of constituted solution)—Constitute Cefazolin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with *pH 7.0 buffer* to obtain a stock solution containing about 1 mg of cefazolin per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *pH 7.0 buffer* to volume, and mix.

*Procedure*—Proceed as directed in the Assay under *Cefazolin*. Calculate the quantity, in mg, of cefazolin ( $C_{14}H_{14}N_8O_4S_3$ ) in the container, and in the volume of constituted solution taken by the formula:

$$(CL / D)(R_U / R_S)$$

in which *L* is the labeled quantity, in mg, of cefazolin in the container, or in the volume of constituted solution taken; *D* is the concentration, in mg per mL, of cefazolin in the stock solution used in preparing *Assay preparation 1* or *Assay preparation 2*, on the basis of the labeled quantity in the container, or in the volume of constituted solution taken, respectively, and the extent of dilution; and the other terms are as defined therein. Where the test for *Uniformity of dosage units* has been performed using the *Procedure for content uniformity*, use the average of these determinations as the Assay value.

## Cefazolin Ophthalmic Solution

**DEFINITION**

Cefazolin Ophthalmic Solution contains an amount of cefazolin sodium equivalent to NLT 29.7 mg and NMT 36.3 mg of cefazolin ( $C_{14}H_{14}N_8O_4S_3$ ) in 10.0 mL of Ophthalmic Solution.

Use Cefazolin Sodium or Cefazolin for Injection that contains the designated amount of cefazolin, and prepare the Ophthalmic Solution as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Cefazolin Sodium	35 mg
Thimerosal	0.2 mg
Sodium Chloride Injection (0.9%), a sufficient quantity to make	10.0 mL

Dissolve *Cefazolin Sodium* and *Thimerosal* in *Sodium Chloride Injection* (0.9%), and dilute quantitatively, and stepwise if necessary, with *Sodium Chloride Injection* (0.9%) to obtain a solution containing 3.5 mg/mL of *Cefazolin Sodium* and 0.02 mg/mL of *Thimerosal*. Filter a 10.0-mL portion of the resulting solution to produce a clear and sterile Ophthalmic Solution. If Cefazolin for Injection is used, prepare the Ophthalmic Solution as follows. Dissolve *Thimerosal* in *Sodium Chloride Injection* (0.9%), and dilute

quantitatively, and stepwise if necessary, with *Sodium Chloride Injection* (0.9%) to obtain a solution containing 0.3 mg/mL of *Thimerosal*. Add 9.8 mL of the resulting solution to a vial of *Cefazolin for Injection*, containing 500 mg of cefazolin, and mix to obtain a stock solution. Transfer 3.3 mL of the stock solution to a 50-mL volumetric flask, dilute with *Sodium Chloride Injection* (0.9%) to volume, and mix. Filter a 10.0-mL portion of the resulting solution to produce a clear and sterile Ophthalmic Solution.

## ASSAY

### PROCEDURE

**Buffer A:** 0.900 g/L of anhydrous dibasic sodium phosphate and 1.298 g/L of citric acid monohydrate; this solution should have a pH of 3.6.

**Buffer B:** 5.68 g/L of anhydrous dibasic sodium phosphate and 3.63 g/L monobasic potassium phosphate; this solution should have a pH of 7.0.

**Solution A:** Acetonitrile and *Buffer A* (10:90). Pass through a filter having a pore size of 5- $\mu$ m or finer, and degas.

**Solution B:** Acetonitrile and *Buffer A* (80:20). Pass through a filter having a pore size of 5- $\mu$ m or finer, and degas.

**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	0	100
25	100	0

**Standard solution:** 0.32 mg/mL of USP Cefazolin RS in *Buffer B*. Maintain at 4° before injection. Use low-actinic volumetric glassware.

**Sample solution:** Transfer 1.0 mL of Ophthalmic Solution to a 10-mL low-actinic volumetric flask, dilute with *Buffer B* to volume, and mix. Maintain at 4° before injection.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 273 nm

**Column:** 3.9-mm  $\times$  30-cm; 10- $\mu$ m packing L1

**Column temperature:** 25°

**Flow rate:** 2 mL/min

**Injection volume:** 10  $\mu$ L

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Column efficiency:** NLT 1500 theoretical plates

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0% for replicate injections

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in mg, of cefazolin ( $C_{14}H_{14}N_8O_4S_3$ ) in 10 mL of Ophthalmic Solution:

$$\text{Result} = (r_U/r_S) \times C_S \times D \times V$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Cefazolin RS in the *Standard solution* (mg/mL)  
 $D$  = dilution factor, 10  
 $V$  = final volume of Ophthalmic Solution, 10 mL

**Acceptance criteria:** 29.7–36.3 mg

## SPECIFIC TESTS

### STERILITY

(See *Pharmaceutical Compounding—Nonsterile Preparations* <795>, *General Guidelines for Assigning Beyond-Use Dates*.)

**Acceptance criteria:** Meets the requirements

**pH <791>:** 4.5–6.0

## ADDITIONAL REQUIREMENTS

**PACKAGING AND STORAGE:** Package in tight, sterile ophthalmic containers. Store in a refrigerator.

**LABELING:** Label it to state that it is intended for use in the eye, and is not to be used if a precipitate is present.

**BEYOND-USE DATE:** NMT 5 days after the date on which it was compounded

**USP REFERENCE STANDARDS <11>**  
 USP Cefazolin RS

## Cefdinir

$C_{14}H_{13}N_5O_5S_2$  395.41

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[(2-amino-4-thiazolyl)(hydroxyimino)acetyl]amino]-3-ethenyl-8-oxo-, [6R-[6 $\alpha$ ,7 $\beta$ (Z)]]-;

(-)-(6R,7R)-7-[2-(2-Amino-4-thiazolyl)glyoxylamido]-8-oxo-3-vinyl-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7 $\beta$ -(Z)-oxime [91832-40-5].

## DEFINITION

Cefdinir contains NLT 940  $\mu$ g/mg and NMT 1030  $\mu$ g/mg of cefdinir ( $C_{14}H_{13}N_5O_5S_2$ ), calculated on the anhydrous basis.

## IDENTIFICATION

**A. INFRARED ABSORPTION <197M>**

**B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

## ASSAY

### PROCEDURE

**Solution A:** 14.2 g/L of anhydrous dibasic sodium phosphate

**Solution B:** 13.6 g/L of monobasic potassium phosphate

**Solution C:** Dilute tetramethylammonium hydroxide (10%) with water to obtain a 0.1% solution. Adjust with 10% phosphoric acid to a pH of 5.5.

**Solution D:** 37.2 mg/mL of edetate disodium

**Buffer:** Combine appropriate amounts of *Solution A* and *Solution B* (about 2:1) to obtain a solution with a pH of 7.0.

**Mobile phase:** Acetonitrile, methanol, *Solution C*, and *Solution D* (300:200:4500:2)

**System suitability solution:** 0.2 mg/mL of USP Cefdinir RS and 0.5 mg/mL of USP Cefdinir Related Compound A RS in *Buffer*

**Standard solution:** 0.2 mg/mL of USP Cefdinir RS in *Buffer*

**Sample solution:** 0.2 mg/mL of Cefdinir in *Buffer*

## Cefdinir Capsules

### DEFINITION

Cefdinir Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of cefdinir (C<sub>14</sub>H<sub>13</sub>N<sub>5</sub>O<sub>5</sub>S<sub>2</sub>).

### IDENTIFICATION

#### • A. ULTRAVIOLET ABSORPTION (197U)

**Buffer:** Prepare as directed in the *Assay*.

**Blank:** Use the *Buffer*.

**Standard solution:** 10 µg/mL of USP Cefdinir RS in *Buffer*.

**Sample solution:** Equivalent to 10 µg/mL of cefdinir from Capsules in *Buffer*. Filter before use.

**Cell size:** 1 cm

**Acceptance criteria:** *Sample solution* maxima and minima occur at the same wavelengths as those in the *Standard solution*.

#### • B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Buffer:** 10.7 g/L of dibasic sodium phosphate and 3.4 g/L of monobasic potassium phosphate. Adjust with phosphoric acid or sodium hydroxide to a pH of 7.0 ± 0.05 before final dilution.

**Solution A:** 7 g/L citric acid monohydrate. Adjust with phosphoric acid to a pH of 2.0 ± 0.05.

**Mobile phase:** Methanol, tetrahydrofuran, and *Solution A* (111:28:1000)

**System suitability solution:** 50 µg/mL of USP Cefdinir RS and 175 µg/mL of *m*-hydroxybenzoic acid in *Buffer*

**Standard solution:** 50 µg/mL of USP Cefdinir RS in *Buffer*

**Sample solution:** Equivalent to 50 µg/mL of cefdinir, from Capsule contents (NLT 20) in *Buffer*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 15-cm; 4-µm packing L1

**Flow rate:** 1.4 mL/min

**Injection size:** 15 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** Greater than 3.0 between cefdinir and *m*-hydroxybenzoic acid, *System suitability solution*

**Tailing factor:** NMT 2.0 for cefdinir, *System suitability solution*

**Relative standard deviation:** NMT 1.0% for cefdinir, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of cefdinir (C<sub>14</sub>H<sub>13</sub>N<sub>5</sub>O<sub>5</sub>S<sub>2</sub>) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for cefdinir from the *Sample solution*

$r_S$  = peak response for cefdinir from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of cefdinir in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–100.0%

## PERFORMANCE TESTS

### • DISSOLUTION (711)

**Medium:** 50 mM phosphate buffer pH 6.8; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Detector:** UV 290 nm

**Cell length:** 0.1-cm flow cell

**Standard solution:** 0.33 mg/mL of USP Cefdinir RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size. Dilute with *Medium* to a concentration of about 0.33 mg/mL of cefdinir.

**Blank:** Dissolve 1 empty Capsule in 100 mL of *Medium*, and dilute to 900 mL. Filter if necessary.

**Analysis:** Determine the percentage of the labeled amount of cefdinir ( $C_{14}H_{13}N_5O_5S_2$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times D \times (V/L) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$D$  = dilution factor of the *Sample solution* (mL/mL)

$V$  = volume of *Medium*, 900 mL

$L$  = label claim (mg/Capsule)

**Tolerances:** NLT 80% (Q) of the labeled amount of cefdinir ( $C_{14}H_{13}N_5O_5S_2$ ) is dissolved.

### • UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

## IMPURITIES

### Change to read:

### • ORGANIC IMPURITIES

**Solution A:** 14.2 g/L of anhydrous dibasic sodium phosphate

**Solution B:** 13.6 g/L of monobasic potassium phosphate

**Solution C:** Dilute tetramethylammonium hydroxide (10% aqueous) with water to obtain a 0.1% solution. Adjust with dilute phosphoric acid (1 in 10) to a pH of  $5.5 \pm 0.1$ .

**Solution D:** 37.2 mg/mL of edetate disodium

**Solution E:** To 1000 mL of *Solution C* add 0.4 mL of *Solution D*.

**Solution F:** Acetonitrile, methanol, *Solution C*, and *Solution D* (150: 100: 250: 0.2)

**Buffer:** Combine appropriate amounts of *Solution A* and *Solution B* (about 2:1) to obtain a solution with a pH of  $7.0 \pm 0.1$ .

**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution E (%)	Solution F (%)
0	95	5
2	95	5
22	75	25
32	50	50
37	50	50
38	95	5
58	95	5

**System suitability stock solution 1:** 40 μg/mL of USP Cefdinir Related Compound A RS in *Solution C*

**System suitability stock solution 2:** 40 μg/mL of USP Cefdinir Related Compound B RS in *Solution C*

**System suitability solution:** Transfer 37.5 mg of USP Cefdinir RS to a 25-mL volumetric flask. Add about 10 mL of *Buffer*. Add 5.0 mL of each of *System suitability stock solution 1* and *System suitability stock solution 2*, and dilute with *Solution C* to volume.

**Standard stock solution:** 750 μg/mL of USP Cefdinir RS in *Buffer*

**Standard solution:** 15 μg/mL of USP Cefdinir RS, from the *Standard stock solution* in *Solution C*

**Sample solution:** Transfer an equivalent to 300 mg of cefdinir from Capsule contents (NLT 20) into a 200-mL volumetric flask. Dissolve in 30 mL of *Buffer*, and dilute with *Solution C* to volume to obtain a solution having a nominal concentration of about 1.5 mg/mL of cefdinir.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Column temperature:** 40°

**Autosampler temperature:** 4°

**Flow rate:** 1 mL/min

**Injection size:** 10 μL

### System suitability

**Samples:** *System suitability solution* and *Standard solution*

### Suitability requirements

**Resolution:** NLT 1.5 between cefdinir and the third peak of the USP Cefdinir Related Compound A RS, *System suitability solution*

**Tailing factor:** NMT 1.5 for cefdinir related compound B, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for the cefdinir peak response, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cefdinir in the *Sample solution* (mg/mL) (ERR 1-Jul-2012)

$F$  = relative response factor (see *Table 2*)

**Acceptance criteria:** See *Table 2*.

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight light-resistant containers, and store at controlled room temperature.

## Cefdinir for Oral Suspension

### DEFINITION

Cefdinir for Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of cefdinir (C<sub>14</sub>H<sub>13</sub>N<sub>5</sub>O<sub>5</sub>S<sub>2</sub>). It may contain one or more suitable buffers, flavors, preservatives, stabilizing agents, sweeteners, and suspending agents.

### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Buffer:** 10.7 mg/mL of anhydrous dibasic sodium phosphate and 3.4 mg/mL of monobasic potassium phosphate in water. Adjust with phosphoric acid or sodium hydroxide to a pH of 7.0 ± 0.05 before final dilution.

**Solution A:** 7 mg/mL of citric acid monohydrate. Adjust with phosphoric acid to a pH of  $2.0 \pm 0.05$ .

**Mobile phase:** Methanol, tetrahydrofuran, and *Solution A* (111:28:1000)

**System suitability solution:** 50 µg/mL of USP Cefdinir RS and 175 µg/mL of *m*-hydroxybenzoic acid in *Buffer*

**Standard solution:** 50 µg/mL of USP Cefdinir RS in *Buffer*

**Sample solution:** Equivalent to 50 µg/mL of cefdinir, from constituted Cefdinir for Oral Suspension, in *Buffer*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm  $\times$  15-cm; 4-µm packing L1

**Flow rate:** 1.4 mL/min

**Injection size:** 15 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 3.0 between cefdinir and *m*-hydroxybenzoic acid, *System suitability solution*

**Tailing factor:** NMT 2.0 for cefdinir, *System suitability solution*

**Relative standard deviation:** NMT 1.0% for cefdinir, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of cefdinir ( $C_{14}H_{13}N_5O_5S_2$ ) in the portion of Cefdinir for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of cefdinir from the *Sample solution*

$r_S$  = peak response of cefdinir from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of cefdinir in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

**Medium:** 0.05 M phosphate buffer pH 6.8; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Detector:** UV 290 nm

**Standard solution:** 0.14 mg/mL of USP Cefdinir RS in *Medium*

**Sample solution:** Transfer 5 mL, by weight, of the reconstituted Cefdinir for Oral Suspension into the vessel. After the appropriate time, withdraw a portion of the solution under test, and pass through a suitable filter of 0.45-µm pore size. Dilute a portion of each filtered sample with *Medium* as necessary to obtain a solution having a concentration of about 0.14 mg/mL of cefdinir.

**Blank:** *Medium*

#### Analysis:

Determine the percentage of the labeled amount of cefdinir ( $C_{14}H_{13}N_5O_5S_2$ ) dissolved:

$$\text{Result} = (A_U/A_S) \times [(C_S \times d \times D \times V)/W \times L] \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$d$  = density of the Cefdinir for Oral Suspension (mg/mL)

$D$  = dilution factor of the *Sample solution* (mL/mL)

$V$  = volume of *Medium*, 900 mL

$W$  = weight of Cefdinir for Oral Suspension taken (mg)

$L$  = label claim (mg/mL)

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{14}H_{13}N_5O_5S_2$  is dissolved.

• **UNIFORMITY OF DOSAGE UNITS <905>** (for solids packaged in single-unit containers): Meets the requirements

• **DELIVERABLE VOLUME <698>** (for solids packaged in single-unit containers): Meets the requirements

### IMPURITIES

#### Organic Impurities

##### • PROCEDURE

**Solution A:** 14.2 mg/mL of anhydrous dibasic sodium phosphate

**Solution B:** 13.6 mg/mL of monobasic potassium phosphate

**Buffer:** Combine appropriate amounts of *Solution A* and *Solution B* (about 2:1) to obtain a solution with a pH of  $7.0 \pm 0.1$ .

**Solution C:** Dilute tetramethylammonium hydroxide (10% aqueous) with water to obtain a 0.1% solution. Adjust with dilute phosphoric acid (1 in 10) to a pH of  $5.5 \pm 0.1$ .

**Solution D:** 37.2 mg/mL of edetate disodium

**Solution E:** To 1000 mL of *Solution C* add 0.4 mL of *Solution D*.

**Solution F:** Acetonitrile, methanol, *Solution C*, and *Solution D* (150:100:250:0.2)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution E (%)	Solution F (%)
0	95	5
2	95	5
22	75	25
32	50	50
37	50	50
38	95	5
58	95	5

**System suitability stock solution 1:** 40 µg/mL of USP Cefdinir Related Compound A RS in *Solution C*

**System suitability stock solution 2:** 40 µg/mL of USP Cefdinir Related Compound B RS in *Buffer*

**System suitability solution:** Transfer 37.5 mg of USP Cefdinir RS to a 25-mL volumetric flask. Add about 10 mL of *Buffer*. Add 5.0 mL each of *System suitability stock solution 1* and *System suitability stock solution 2*, and dilute with *Solution C* to volume.

**Standard stock solution:** 750 µg/mL of USP Cefdinir RS in *Buffer*

**Standard solution:** 15 µg/mL of USP Cefdinir RS, from the *Standard stock solution* in *Solution C*

**Sample solution:** Transfer a quantity equivalent to 150 mg of cefdinir from constituted Cefdinir for Oral Suspension to a 100-mL volumetric flask. Dissolve in 30 mL of *Buffer*, and dilute with *Solution C* to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; 5-µm packing L1

**Column temperature:** 40°

**Autosampler temperature:** 4°

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 1.5 between cefdinir and the third peak for USP Cefdinir Related Compound A RS, *System suitability solution*

**Tailing factor:** NMT 1.5 for cefdinir related compound B, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for the cefdinir peak response, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Cefdinir for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of cefdinir from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cefdinir in the *Sample solution* (mg/mL)

$F$  = relative response factor (see Table 2)

**Acceptance criteria:** See Table 2.

**Table 2**

$C_{19}H_{25}ClN_6O_5S_2 \cdot HCl \cdot H_2O$  571.50  
 Pyrrolidinium, 1-[[[7-[(2-amino-4-thiazolyl)(methoxyimino)acetyl]amino]-2-carboxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-en-3-yl]methyl]-1-methyl-, chloride, monohydrochloride, monohydrate, [6*R*-[6*α*,7*β*(*Z*)]-; 1-[[[(6*R*,7*R*)-7-[2-(2-Amino-4-thiazolyl)glyoxylamido]-2-carboxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-en-3-yl]methyl]-1-methylpyrrolidinium chloride, 7*2*-(*Z*)-(O-methyloxime), monohydrochloride, monohydrate [123171-59-5].

**DEFINITION**

Cefepime Hydrochloride contains the equivalent of NLT 825 µg and NMT 911 µg of cefepime ( $C_{19}H_{24}N_6O_5S_2$ )/mg, calculated on the anhydrous basis.

**IDENTIFICATION**

- **INFRARED ABSORPTION** (197M)  
**Sample:** Proceed as directed in the chapter, but do not dry.

**ASSAY**

- **PROCEDURE**
  - Solution A:** 0.68 mg/mL of monobasic potassium phosphate in water
  - Solution B:** Acetonitrile and *Solution A* (1:9). Adjust with 2% phosphoric acid or 2% potassium hydroxide to a pH of 5.0.
  - Solution C:** Acetonitrile and *Solution A* (1:1). Adjust with 2% phosphoric acid or 2% potassium hydroxide to a pH of 5.0.
  - Mobile phase:** See the gradient table below.

Time (min)	Solution B (%)	Solution C (%)
0	100	0
10	100	0

Time (min)	Solution B (%)	Solution C (%)
30	50	50
35	50	50
36	100	0
45	100	0

**Standard solution:** 1.4 mg/mL of USP Cefepime Hydrochloride RS in *Solution B*. [NOTE—Sonicate if necessary. Inject immediately or store in a refrigerator and use within 12 h.]

**Sample solution:** 1.4 mg/mL of Cefepime Hydrochloride in *Solution B*. [NOTE—Sonicate if necessary. Inject immediately or store in a refrigerator and use within 12 h.]

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in µg, of  $C_{19}H_{24}N_6O_5S_2$  in each mg of Cefepime Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Cefepime Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Cefepime Hydrochloride in the *Sample solution* (mg/mL)

$P$  = content of cefepime in USP Cefepime Hydrochloride RS (µg/mg)

**Acceptance criteria:** 825–911 µg/mg on the anhydrous basis

**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS, Method II** (231): NMT 20 ppm

**Organic Impurities**

- **PROCEDURE 1: LIMIT OF N-METHYLPYRROLIDINE**

**Mobile phase:** Acetonitrile and 0.01 N nitric acid (1:19)

**Standard solution:** 0.05 mg/mL of *N*-methylpyrrolidine in 0.002 N nitric acid

**Sample solution:** Equivalent to 5 mg/mL of cefepime hydrochloride in 0.002 N nitric acid. [NOTE—Inject this solution immediately.]

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** Conductivity

**Column:** 4.0-mm × 25-cm; 5-µm packing L#1

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 4.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

[NOTE— Record the chromatogram of the *Sample solution* for about 6 times the retention time of the *N*-methylpyrrolidine peak.]

<sup>1</sup> Available as Metrosep C4-250.

Calculate the percentage of *N*-methylpyrrolidine in the portion of Cefepime Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of *N*-methylpyrrolidine from the *Sample solution*  
 $r_S$  = peak response of *N*-methylpyrrolidine from the *Standard solution*  
 $C_S$  = concentration of *N*-methylpyrrolidine in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Cefepime Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.3%

• **PROCEDURE 2: OTHER ORGANIC IMPURITIES**

**Solution A, Solution B, Solution C, Mobile phase, Sample solution and Chromatographic system:** Prepare as directed in the *Assay*.

**System suitability solution:** 1.4 mg/mL of USP Cefepime Hydrochloride RS and 15 µg/mL each of USP Cefepime Related Compound D RS and USP Cefepime Related Compound E RS in *Solution B*

**System suitability**

**Samples:** *System suitability solution*

**Suitability requirements**

[NOTE— See *Impurity Table 1* for the relative retention times.]

**Resolution:** NLT 2.0 between cefepime related compound E and cefepime related compound D

**Tailing factor:** NMT 1.5, cefepime

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Cefepime Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 1/F \times 100$$

- $r_U$  = peak response of each impurity  
 $r_T$  = sum of the peak responses for all the peaks in the chromatogram  
 $F$  = relative response factor from *Impurity Table 1*

**Acceptance criteria**

[NOTE—The reporting level is 0.2% for cefepime impurity C and 0.05% for all other related compounds.]

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 1.0%. [NOTE— Total impurities does not include *N*-methylpyrrolidine.]

**SPECIFIC TESTS**

- **BACTERIAL ENDOTOXINS <85>:** Where the label states that Cefepime Hydrochloride is sterile or that it must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.04 USP Endotoxin Unit/mg of cefepime hydrochloride.
- **STERILITY TESTS <71>:** Where the label states that Cefepime Hydrochloride is sterile, it meets the requirements when tested as directed in the *Test for Sterility of the Product to be Examined*, *Membrane Filtration*.
- **CRYSTALLINITY <695>:** Meets the requirements
- **WATER DETERMINATION, Method I <921>:** 3.0%–4.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or

must be subjected to further processing during the preparation of injectable dosage forms.

## Cefepime for Injection

### DEFINITION

Cefepime for Injection is a sterile mixture of Cefepime Hydrochloride and Arginine. It contains the equivalent of NLT 90.0% and NMT 115.0% of the labeled amount of cefepime ( $C_{19}H_{24}N_6O_5S_2$ ).

### IDENTIFICATION

#### • A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

**Standard solution:** 20 mg/mL of arginine

**Sample solution:** 40 mg/mL of Cefepime for Injection

**Developing solvent system:** *n*-Propyl alcohol, ammonium hydroxide, and water (7:4:5)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Proceed as directed in *Thin-Layer Chromatographic Identification Test* (201), except to spray the plate with ninhydrin TS.

**Acceptance criteria:** Arginine appears as a dark red spot. The intensity and the  $R_f$  value of the spot from the *Sample solution* correspond to those from the *Standard solution*.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Solution A:** 0.68 mg/mL of monobasic potassium phosphate in water

**Solution B:** Acetonitrile and *Solution A* (1:9), adjusted with 2% phosphoric acid or 2% potassium hydroxide to a pH of 5.0

**Solution C:** Acetonitrile and *Solution A* (1:1), adjusted with 2% phosphoric acid or 2% potassium hydroxide to a pH of 5.0

**Mobile phase:** See the gradient table below.

Time (min)	Solution B (%)	Solution C (%)
0	100	0
10	100	0
30	50	50
35	50	50
36	100	0
45	100	0

**Standard solution:** 1.4 mg/mL of USP Cefepime Hydrochloride RS in *Solution B*. [NOTE—Sonicate if necessary. Inject immediately or store in a refrigerator and use within 12 h.]

**Sample solution:** Constitute one container of Cefepime for Injection as directed on the label, and dilute using *Solution B* to 1 mg/mL of cefepime. [NOTE—For products that are designed for administration with a syringe, withdraw the entire withdrawable contents of the vial and transfer to a suitable volumetric flask. Dilute with *Solution B* to volume. For all other types, transfer the contents of the reconstituted vial quantitatively to a suitable volumetric flask, and dilute with *Solution B* to volume.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{19}H_{24}N_6O_5S_2$  in the portion of Cefepime for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Cefepime Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Cefepime for Injection in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–115.0%

### PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements

### IMPURITIES

#### Organic Impurities

##### • PROCEDURE 1: LIMIT OF N-METHYLPYRROLIDINE

**Mobile phase:** Acetonitrile and 0.01 N nitric acid (1:19)

**Standard solution:** 0.05 mg/mL of *N*-methylpyrrolidine in 0.002 N nitric acid

**Sample solution:** Equivalent to 5 mg/mL of cefepime hydrochloride in 0.002 N nitric acid. [NOTE—Inject this solution immediately.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** Conductivity

**Column:** 4.0-mm × 25-cm; 5-μm packing L#1

## Cefixime

$C_{16}H_{15}N_5O_7S_2 \cdot 3H_2O$  507.50  
 5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid,  
 7-[[[(2-amino-4-thiazolyl)  
 [(carboxymethoxy)imino]acetyl]amino]-3-ethenyl-8-oxo-,  
 trihydrate, [6R-[6 $\alpha$ ,7 $\beta$ (Z)]]-.  
 (6R,7R)-7-[2-(2-Amino-4-thiazolyl)glyoxylamido]-8-oxo-  
 3-vinyl-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic  
 acid, 7 $\alpha$ -(Z)-[O-(carboxymethyl)oxime]trihydrate  
 [79350-37-1].  
 Anhydrous 453.46

» Cefixime contains the equivalent of not less than 950  $\mu$ g and not more than 1030  $\mu$ g of Cefixime ( $C_{16}H_{15}N_5O_7S_2$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label to indicate that it is the trihydrate form. Where the quantity of Cefixime is indicated in the labeling of any preparation containing Cefixime, this shall be understood to be in terms of anhydrous cefixime ( $C_{16}H_{15}N_5O_7S_2$ ).

### USP Reference standards (11)—

USP Cefixime RS

**Identification, Infrared Absorption** (197K)—Prepare the test specimen as follows. Dissolve about 5 mg of it by trituration in 2 mL of methanol and evaporate with the aid of gentle heat to dryness.

**Specific rotation** (781S): between  $-75^\circ$  and  $-88^\circ$ .

*Test solution*: 10 mg per mL, in sodium bicarbonate solution (2 in 100).

**Crystallinity** (69S): meets the requirements.

**pH** (791): between 2.6 and 4.1, in a solution containing the equivalent of 0.7 mg of cefixime per mL.

**Water, Method I** (921): between 9.0% and 12.0%.

### Chromatographic purity—

*Tetrabutylammonium hydroxide solution, Mobile phase, Monobasic potassium phosphate solution, pH 7.0 Phosphate Buffer, Resolution solution, and Chromatographic system*—Proceed as directed in the Assay.

*Standard solution*—Use the *Standard preparation* prepared as directed in the Assay.

*Test solution*—Use the *Assay preparation*.

*Procedure*—Inject a volume (about 10  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak areas. Calculate the percentage of each impurity in the portion of Cefixime taken by the formula:

$$0.1P(r_i / r_s)$$

in which  $P$  is the potency, in  $\mu$ g per mg, of cefixime calculated in the Assay;  $r_i$  is the peak area for each impurity; and  $r_s$  is the cefixime peak area: not more than 1.0% of any individual impurity is found; and not more than 2.0% of total impurities is found.

### Assay—

*Tetrabutylammonium hydroxide solution*—Dilute 25 mL of 0.4 M tetrabutylammonium hydroxide solution with water

to obtain 1000 mL of solution, and adjust with 1.5 M phosphoric acid to a pH of 6.5.

*Mobile phase*—Prepare a suitable filtered and degassed mixture of *Tetrabutylammonium hydroxide solution* and acetonitrile (3:1). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

*Monobasic potassium phosphate solution*—Dissolve 6.8 g of monobasic potassium phosphate in water to make 500 mL of solution.

*pH 7.0 Phosphate Buffer*—Dissolve 7.1 g of anhydrous dibasic sodium phosphate in water to make 500 mL of solution. Adjust a volume of this solution with a sufficient volume of *Monobasic potassium phosphate solution* to a pH of 7.0.

*Resolution solution*—Dissolve USP Cefixime RS in water to obtain a solution having a concentration of about 1 mg per mL. Heat this solution at  $95^\circ$  in an oil bath for 45 minutes, cool, and use promptly.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Cefixime RS in *pH 7.0 Phosphate buffer* to obtain a solution having a known concentration of about 0.2 mg of cefixime ( $C_{16}H_{15}N_5O_7S_2$ ) per mL. Use this solution promptly.

*Assay preparation*—Transfer about 110 mg of Cefixime, accurately weighed, to a 100-mL volumetric flask, dilute with *pH 7.0 Phosphate buffer* to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with *pH 7.0 Phosphate buffer* to volume, and mix. Use this solution promptly.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  12.5-cm column containing 4- $\mu$ m packing L1. The flow rate is adjusted so that the retention time of cefixime is about 10 minutes. The column is maintained at a constant temperature of about  $40^\circ$ . Chromatograph the *Resolution solution*, and record the peak areas as directed for *Procedure*: the relative retention times are about 0.9 for cefixime (*E*-isomer) and 1.0 for cefixime; and the resolution,  $R$ , between cefixime and cefixime (*E*-isomer) is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the column efficiency is not less than 4000 theoretical plates when calculated by the formula:

$$5.545(t / W_{h/2})^2$$

the tailing factor for the analyte peak is not less than 0.9 and not more than 2.0, when calculated by the formula:

$$W_{0.1} / 2f$$

in which  $W_{0.1}$  is width of peak of 10% height; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in  $\mu$ g, of cefixime ( $C_{16}H_{15}N_5O_7S_2$ ) in each mg of Cefixime taken by the formula:

$$500,000(C / W)(r_u / r_s)$$

in which  $C$  is the concentration, in mg per mL, of cefixime in the *Standard preparation*;  $W$  is the quantity, in mg, of Cefixime taken to prepare the *Assay preparation*; and  $r_u$  and  $r_s$  are the cefixime peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefixime for Oral Suspension

### DEFINITION

Cefixime for Oral Suspension is a dry mixture of Cefixime and one or more suitable diluents, flavors, preservatives, and suspending agents. It contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of cefixime ( $C_{16}H_{15}N_5O_7S_2$ )/mL when constituted as directed in the labeling.

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Solution A:** 0.4 M tetrabutylammonium hydroxide solution and water (1:39). Adjust with 1.5 M phosphoric acid to a pH of 6.5.

**Solution B:** 13.6 mg/mL of monobasic potassium phosphate

**Solution C:** 14.2 mg/mL of anhydrous dibasic sodium phosphate. Adjust a volume of this solution with a sufficient volume of *Solution B* to a pH of 7.0.

**Mobile phase:** Acetonitrile and *Solution A* (1:3)

**System suitability solution:** 1 mg/mL of USP Cefixime RS. [NOTE—Heat this solution at 95° in an oil bath for 45 min, cool, and use promptly.]

**Standard solution:** 0.2 mg/mL of USP Cefixime RS in *Solution C*. [NOTE—Use this solution promptly.]

**Sample solution:** Constitute Cefixime for Oral Suspension as directed in the labeling. Quantitatively dilute a suitable aliquot of the suspension, freshly mixed and free from air bubbles, with *Solution C* to obtain a solution having a nominal concentration of 0.2 mg of cefixime/mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 12.5-cm; 4-μm packing L1

**Temperature:** 40°

**Flow rate:** Adjust flow rate so that the retention time of cefixime is about 10 min.

**Injection size:** 10 μL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for cefixime (*E*)-isomer and cefixime are about 0.9 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between cefixime and cefixime (*E*)-isomer, *System suitability solution*

**Column efficiency:** NLT 4000 theoretical plates, *Standard solution*. Use the following formula to calculate column efficiency:

$$\text{Result} = 5.545(t/W_{h/2})^2$$

**Tailing factor:** NLT 0.9 and NMT 2.0 for the analyte peak, *Standard solution*. Use the following formula to calculate tailing factor:

$$\text{Result} = W_{0.1}/2f$$

$W_{0.1}$  = peak width at 10% peak height

**Relative standard deviation:** NMT 2.0%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{16}H_{15}N_5O_7S_2$  in the constituted suspension prepared from the Cefixime for Oral Suspension:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of cefixime from the *Sample solution*

$r_S$  = peak response of cefixime from the *Standard solution*

$C_S$  = concentration of USP Cefixime RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cefixime in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–120.0%

### PERFORMANCE TESTS

- UNIFORMITY OF DOSAGE UNITS** (905) FOR SOLIDS PACKAGED IN SINGLE-UNIT CONTAINERS: Meets the requirements
- DELIVERABLE VOLUME** (698): Meets the requirements

### SPECIFIC TESTS

- pH** (791): 2.5–4.5, in the suspension constituted as directed in the labeling

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers.
- LABELING:** Label it to indicate that the cefixime contained therein is in the trihydrate form.
- USP REFERENCE STANDARDS** (11)  
USP Cefixime RS

## Cefixime Tablets

» Cefixime Tablets contain the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cefixime ( $C_{16}H_{15}N_5O_7S_2$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label the Tablets to indicate that the cefixime contained therein is in the trihydrate form.

**USP Reference standards** (11)—

USP Cefixime RS

**Identification**—The retention time of the major peak for cefixime in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

**Medium:** 0.05 M potassium phosphate buffer, pH 7.2, prepared by dissolving 6.8 g of monobasic potassium phosphate in 1000 mL of water and adjusting with 1 N sodium hydroxide to a pH of 7.2; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of cefixime ( $C_{16}H_{15}N_5O_7S_2$ ) dissolved from UV absorbances at the wavelength of maximum absorbance at about 288 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium* if necessary, in comparison with a *Standard solution* having a known concentration of USP Cefixime RS in the same medium. [NOTE—An amount of methanol not to exceed 0.1% of the total volume of the *Standard solution* may be used to bring the Reference Standard into solution prior to dilution with *Dissolution Medium*, and the solution may be sonicated to assure complete dissolution of the Reference Standard.]

**Tolerances**—Not less than 75% (Q) of the labeled amount of cefixime ( $C_{16}H_{15}N_5O_7S_2$ ) is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 10.0%.

#### Assay—

*Tetrabutylammonium hydroxide solution, Mobile phase, pH 7.0 Phosphate buffer, Resolution solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Cefixime.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 400 mg of cefixime, to a 100-mL volumetric flask, add 75 mL of pH 7.0 Phosphate buffer, and sonicate. Dilute with pH 7.0 Phosphate buffer to volume, mix, and centrifuge. Transfer 5.0 mL of the clear supernatant to a second 100-mL volumetric flask, dilute with pH 7.0 Phosphate buffer to volume, and mix.

**Procedure**—Proceed as directed in the Assay under Cefixime. Calculate the quantity, in mg, of cefixime ( $C_{16}H_{15}N_5O_7S_2$ ) in the portion of Tablets taken by the formula:

$$2000C(r_u / r_s)$$

in which the terms are as defined therein.

## Cefmenoxime Hydrochloride

( $C_{16}H_{17}N_9O_5S_3$ )<sub>2</sub> · HCl 1059.58

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[(2-amino-4-thiazolyl)(methoxyimino)acetyl]amino]-3-[[[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-, hydrochloride (2:1), [6R-[6α,7β(Z)]]-

(6R,7R)-7-[2-(2-Amino-4-thiazolyl)glyoxylamido]-3-[[[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid 7<sup>2</sup>-(Z)-(O-methyloxime), hydrochloride (2:1) [75738-58-8].

» Cefmenoxime Hydrochloride contains the equivalent of not less than 869 μg and not more than 1015 μg of cefmenoxime ( $C_{16}H_{17}N_9O_5S_3$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—  
USP Cefmenoxime Hydrochloride RS

#### Identification—

**A: Ultraviolet Absorption** (197U)—

**Solution:** 25 μg per mL.

**Medium:** pH 6.8 buffer (prepared as directed in the Assay).

**B:** The retention time of the cefmenoxime peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, both relative to the internal standard, as obtained in the Assay.

**Crystallinity** (695): meets the requirements.

**Pyrogen** (151)—Where the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements, the test dose being 1.0 mL per kg of a solution in pyrogen-free sodium carbonate solution (prepared by dissolving 14.0 g of sodium carbonate, previously heated at 170° for not less than 4 hours, in 1000 mL of sterile water for injection) containing 60 mg per mL.

**Sterility** (71)—Where the label states that it is sterile, it meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined, except to use Fluid A to each 100 mL of which has been added 2.0 g of sodium carbonate previously sterilized by heating at 180° for 2 hours.

**Water, Method I** (921): not more than 1.5%, the Test Preparation being prepared as directed for a hygroscopic specimen, except to use 20 mL of a mixture of formamide (previously dried over anhydrous sodium sulfate for 24 hours) and methanol (2:1), instead of methanol, to dissolve the specimen, to use two 5-mL portions of the same formamide and methanol mixture to rinse the container, and to determine the water content of the formamide and methanol mixture.

#### Assay—

**pH 6.8 buffer**—Dissolve 6.4 g of monobasic potassium phosphate and 18.9 g of dibasic sodium phosphate in 750 mL of water, adjust with 1 N sodium hydroxide to a pH of 6.8 ± 0.1, dilute with water to 1000 mL, and mix.

**Mobile phase**—Prepare a suitable mixture of water, acetonitrile, and glacial acetic acid (50:10:1). Filter through a suitable filter of 0.5 μm or finer porosity, and degas. Make adjustments if necessary (see System Suitability under Chromatography (621)).

**Internal standard solution**—Prepare a solution of phthalimide in methanol containing 1.5 mg per mL.

**Standard preparation**—Transfer about 50 mg of USP Cefmenoxime Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add 10 mL of pH 6.8 buffer, and dissolve by swirling. Dilute with Mobile phase to volume, and mix. Transfer 4.0 mL of this solution to a second 50-mL volumetric flask, add 20.0 mL of Internal standard solution, dilute with Mobile phase to volume, and mix. This solution contains the equivalent of about 80 μg of cefmenoxime ( $C_{16}H_{17}N_9O_5S_3$ ) per mL.

**Assay preparation**—Transfer about 50 mg of Cefmenoxime Hydrochloride, accurately weighed, to a 50-mL volumetric flask, add 10 mL of pH 6.8 buffer, and dissolve by swirling. Dilute with Mobile phase to volume, and mix. Transfer 4.0 mL of this solution to a second 50-mL volumetric flask, add 20.0 mL of Internal standard solution, dilute with Mobile phase to volume, and mix.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the resolution, *R*, between the phthalimide and the cefmenoxime peaks is not less than 2.3; the column efficiency, determined from the cefmenoxime peak, is not less than 1200 theoretical plates when calculated by the formula:

$$5.545(t_r / W_{h/2})^2$$

the tailing factor for the cefmenoxime peak is not more than 1.6; and the relative standard deviation of replicate injections is not more than 2.0%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 10 μL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and meas-

ure the responses for the major peaks. Calculate the quantity, in  $\mu\text{g}$ , of cefmenoxime ( $\text{C}_{16}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_3$ ) in each mg of the Cefmenoxime Hydrochloride taken by the formula:

$$(W_S P_S / W_U)(R_U / R_S)$$

in which  $W_S$  is the weight, in mg, of USP Cefmenoxime Hydrochloride RS taken to prepare the *Standard preparation*;  $P_S$  is the designated cefmenoxime ( $\text{C}_{16}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_3$ ) content, in  $\mu\text{g}$  per mg, of USP Cefmenoxime Hydrochloride RS;  $W_U$  is the weight, in mg, of Cefmenoxime Hydrochloride taken to prepare the *Assay preparation*, and  $R_U$  and  $R_S$  are the peak response ratios of the cefmenoxime peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefmenoxime for Injection

» Cefmenoxime for Injection contains an amount of Cefmenoxime Hydrochloride equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of cefmenoxime ( $\text{C}_{16}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_3$ ). It may contain Sodium Carbonate.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—  
USP Cefmenoxime Hydrochloride RS

### Identification—

**A:** *Ultraviolet Absorption* (197U)—

*Solution:* 25  $\mu\text{g}$  per mL.

*Medium:* pH 6.8 buffer prepared as directed in the *Assay under Cefmenoxime Hydrochloride*.

**B:** The retention time of the cefmenoxime peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**Pyrogen** (151)—It meets the requirements, the test dose being 1.0 mL per kg of a solution of Cefmenoxime for Injection in sterile water for injection having a concentration of 60 mg of cefmenoxime per mL.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

**pH** (791): between 6.4 and 7.9, in a solution containing the equivalent of 100 mg of cefmenoxime per mL.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 1.5% of its weight.

**Particulate matter** (788): meets the requirements for small-volume injections.

### Assay—

pH 6.8 buffer, *Mobile phase*, *Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Prepare as directed in the *Assay under Cefmenoxime Hydrochloride*.

*Assay preparation 1* (where it is represented as being in a single-dose container)—Constitute a container of Cefmenoxime for Injection in a volume of water, accurately measured, corresponding to the volume of diluent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and quantitatively dilute with water to obtain a solution containing the equivalent of about 1 mg of cefmenoxime ( $\text{C}_{16}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_3$ ) per mL. Transfer 4.0 mL of this solution to a 50-mL volumetric flask,

add 20.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix. This solution contains the equivalent of about 80  $\mu\text{g}$  of cefmenoxime per mL.

*Assay preparation 2* (where the label states the quantity of cefmenoxime in a given volume of constituted solution)—Constitute a container of Cefmenoxime for Injection in a volume of water, accurately measured, equivalent to the volume of diluent specified in the labeling. Quantitatively dilute an accurately measured volume of the constituted solution with water to obtain a solution containing about 1 mg of cefmenoxime ( $\text{C}_{16}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_3$ ) per mL. Transfer 4.0 mL of this solution to a 50-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix. This solution contains the equivalent of about 80  $\mu\text{g}$  of cefmenoxime per mL.

*Procedure*—Proceed as directed for *Procedure* in the *Assay under Cefmenoxime Hydrochloride*. Calculate the quantity, in mg, of cefmenoxime ( $\text{C}_{16}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_3$ ) withdrawn from the container or in the portion of constituted solution taken by the formula:

$$1.6(L / D)(W_S P_S / 1000)(R_U / R_S)$$

in which  $L$  is the labeled quantity, in mg, of cefmenoxime ( $\text{C}_{16}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_3$ ) in the container or in the volume of constituted solution taken;  $D$  is the concentration, in  $\mu\text{g}$  of cefmenoxime per mL, of *Assay preparation 1* or *Assay preparation 2*, based on the labeled quantity in the container or in the volume of constituted solution taken, respectively, and the extent of dilution;  $W_S$  is the weight, in mg, of USP Cefmenoxime Hydrochloride RS taken to prepare the *Standard preparation*;  $P_S$  is the designated cefmenoxime ( $\text{C}_{16}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_3$ ) content, in  $\mu\text{g}$  per mg, of USP Cefmenoxime Hydrochloride RS; and  $R_U$  and  $R_S$  are the response ratios of the cefmenoxime peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefmetazole

$\text{C}_{15}\text{H}_{17}\text{N}_7\text{O}_5\text{S}_3$  471.53

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[(cyanomethyl)thio]acetyl]amino]-7-methoxy-3-[[[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-, (6*R*-*cis*)-, (6*R*,7*S*)-7-[2-[(Cyanomethyl)thio]acetamido]-7-methoxy-3-[[[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid [56796-20-4].

» Cefmetazole contains not less than 970  $\mu\text{g}$  and not more than 1030  $\mu\text{g}$  of cefmetazole ( $\text{C}_{15}\text{H}_{17}\text{N}_7\text{O}_5\text{S}_3$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cefmetazole RS

### Identification—

**A:** *Infrared Absorption* (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Water, Method I** (921): not more than 0.5%.

#### Assay—

**Mobile phase**—Dissolve 5.75 g of monobasic ammonium phosphate in 700 mL of water, add 3.2 mL of a 40% solution of tetrabutylammonium hydroxide, 280 mL of methanol, and 25 mL of tetrahydrofuran, and mix. Adjust with phosphoric acid to a pH of  $4.5 \pm 0.1$ , pass through a filter having a 0.5- $\mu\text{m}$  or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Quantitatively dissolve an accurately weighed quantity of USP Cefmetazole RS in *Mobile phase* to obtain a solution having a known concentration of about 200  $\mu\text{g}$  of cefmetazole ( $\text{C}_{15}\text{H}_{17}\text{N}_7\text{O}_5\text{S}_3$ ) per mL. [NOTE—Use this solution within 10 minutes.]

**Resolution solution**—Prepare a solution of USP Cefmetazole RS in 0.01 N sodium hydroxide containing about 1 mg per mL. Heat at  $95^\circ$  for 10 minutes. To 1 mL of this solution add 2 mL of *Standard preparation*, and dilute with *Mobile phase* to obtain 20 mL of solution. This solution contains cefmetazole and cefmetazole lactone (resolution compound).

**Assay preparation**—Transfer about 20 mg of Cefmetazole, accurately weighed, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. [NOTE—Use this solution within 10 minutes.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between cefmetazole and cefmetazole lactone is not less than 3.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 1250 theoretical plates; the tailing factor is not less than 0.94 and not more than 1.6; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in  $\mu\text{g}$ , of cefmetazole ( $\text{C}_{15}\text{H}_{17}\text{N}_7\text{O}_5\text{S}_3$ ) in each mg of Cefmetazole taken by the formula:

$$100(C/M)(r_U/r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of cefmetazole ( $\text{C}_{15}\text{H}_{17}\text{N}_7\text{O}_5\text{S}_3$ ) in the *Standard preparation*;  $M$  is the quantity, in mg, of Cefmetazole taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the cefmetazole peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefmetazole Injection

» Cefmetazole Injection is a sterile isoosmotic solution of Cefmetazole and Sodium Citrate in Water for Injection. It contains one or more buffer substances and a tonicity-adjusting agent. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cefmetazole ( $\text{C}_{15}\text{H}_{17}\text{N}_7\text{O}_5\text{S}_3$ ).

**Packaging and storage**—Preserve in *Containers for Injections* as described under *Injections* (1). Maintain in the frozen state.

**Labeling**—It meets the requirements for *Labeling* under *Injections* (1). The label states that it is to be thawed just prior to use, describes the conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

#### USP Reference standards (11)—

USP Cefmetazole RS

USP Endotoxin RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that observed in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.2 USP Endotoxin Unit per mg of cefmetazole.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, except to use water instead of *Fluid A*.

**pH** (791): between 4.2 and 6.2.

**Particulate matter** (788): meets the requirements for small-volume injections.

#### Assay—

**Mobile phase, Resolution solution, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay* under *Cefmetazole*.

**Assay preparation**—Allow the contents of a container of Injection to thaw, and mix the resultant solution. Transfer an accurately measured volume of this solution, equivalent to about 40 mg of cefmetazole, to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. [NOTE—Use this solution within 10 minutes.]

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Cefmetazole*. Calculate the quantity, in mg, of cefmetazole ( $\text{C}_{15}\text{H}_{17}\text{N}_7\text{O}_5\text{S}_3$ ) in each mL of the Injection by the formula:

$$0.2(C/VM)(r_U/r_S)$$

in which  $V$  is the volume, in mL, of Injection taken to prepare the *Assay preparation*, and the other terms are as defined therein.

## Cefmetazole Sodium

$\text{C}_{15}\text{H}_{16}\text{N}_7\text{NaO}_5\text{S}_3$  493.52

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[(cyanomethyl)thio]acetyl]amino]-7-methoxy-3-[[[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-, monosodium salt, (6*R*-*cis*)-.

Sodium (6*R*,7*S*)-7-[2-[(cyanomethyl)thio]acetamido]-7-methoxy-3-[[[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [56796-39-5].

» Cefmetazole Sodium contains the equivalent of not less than 860  $\mu\text{g}$  and not more than 1003  $\mu\text{g}$  of cefmetazole ( $\text{C}_{15}\text{H}_{17}\text{N}_7\text{O}_5\text{S}_3$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must

be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Cefmetazole RS  
USP Endotoxin RS

**Identification—**

**A:** *Infrared Absorption* (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**pH** (791): between 4.2 and 6.2, in a solution (1 in 10).

**Water, Method I** (921): not more than 0.5%.

**Other requirements**—Where the label states that Cefmetazole Sodium is sterile, it meets the requirements in the tests for *Sterility* (71) and for *Bacterial endotoxins* under *Cefmetazole for Injection*. Where the label states that Cefmetazole Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements in the test for *Bacterial endotoxins* under *Cefmetazole for Injection*.

**Assay—**

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Cefmetazole*.

*Assay preparation*—Transfer about 21 mg of Cefmetazole Sodium, accurately weighed, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. [NOTE—Use this solution within 10 minutes.]

*Procedure*—Proceed as directed in the *Assay* under *Cefmetazole*. Calculate the quantity, in µg, of cefmetazole ( $C_{15}H_{17}N_7O_5S_3$ ) per mg of Cefmetazole Sodium taken by the formula:

$$100(C/M)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of cefmetazole ( $C_{15}H_{17}N_7O_5S_3$ ) in the *Standard preparation*; *M* is the quantity, in mg, of Cefmetazole Sodium taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the cefmetazole peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefmetazole for Injection

» Cefmetazole for Injection contains an amount of Cefmetazole Sodium equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cefmetazole ( $C_{15}H_{17}N_7O_5S_3$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Cefmetazole RS  
USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 0.2 USP Endotoxin Unit per mg of cefmetazole.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements in the tests for *Identification*, *pH*, and *Water* under *Cefmetazole Sodium*. It meets also the requirements for *Uniformity of Dosage Units* (905) and for *Labeling* under *Injections* (1).

**Assay—**

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Cefmetazole*.

*Assay preparation 1* (where it is represented as being in a single-dose container)—Constitute Cefmetazole for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and quantitatively dilute with *Mobile phase* to obtain a solution containing about 0.2 mg of cefmetazole per mL. [NOTE—Use this solution within 10 minutes.]

*Assay preparation 2* (where the label states the quantity of cefmetazole in a given volume of constituted solution)—Constitute Cefmetazole for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Quantitatively dilute an accurately measured volume of the constituted solution with *Mobile phase* to obtain a solution containing about 0.2 mg of cefmetazole per mL. [NOTE—Use this solution within 10 minutes.]

*Procedure*—Proceed as directed in the *Assay* under *Cefmetazole*. Calculate the quantity, in mg, of cefmetazole ( $C_{15}H_{17}N_7O_5S_3$ ) withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$(L/D)(C/1000)(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of cefmetazole in the container, or in the volume of constituted solution taken; *D* is the concentration, in mg per mL, of cefmetazole ( $C_{15}H_{17}N_7O_5S_3$ ) per mL, of *Assay preparation 1* or *Assay preparation 2*, based on the labeled quantity in the container or in the portion of constituted solution taken, respectively; *C* is the concentration, in µg per mL, of cefmetazole ( $C_{15}H_{17}N_7O_5S_3$ ) in the *Standard preparation*; and  $r_U$  and  $r_S$  are the cefmetazole peak responses obtained from the relevant *Assay preparation* and the *Standard preparation*, respectively.

## Cefonicid Sodium

$C_{18}H_{16}N_6Na_2O_8S_3$  586.53

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[(hydroxyphenylacetyl)amino]-8-oxo-3-[[[1-(sulfomethyl)-1H-tetrazol-5-yl]thio]methyl]disodium salt, [6R-[6α, 7β(R\*)]]-

(6R,7R)-[7-[(R)-Mandelamido]-8-oxo-3-[[[1-(sulfomethyl)-1H-tetrazol-5-yl]thio]methyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, disodium salt [61270-78-8].

» Cefonicid Sodium contains the equivalent of not less than 832 µg and not more than 970 µg of cefonicid ( $C_{18}H_{16}N_6O_8S_3$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Cefonicid Sodium RS  
USP Endotoxin RS

**Identification—**

**A:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for cefonicid, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** It responds to the tests for *Sodium* (191).

**Specific rotation** (781S): between  $-37^{\circ}$  and  $-47^{\circ}$ .

*Test solution:* 10 mg per mL, in methanol.

**pH** (791): between 3.5 and 6.5, in a solution (1 in 20).

**Water, Method I** (921): not more than 5.0%.

**Other requirements—**Where the label states that Cefonicid Sodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Cefonicid for Injection*. Where the label states that Cefonicid Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Cefonicid for Injection*.

**Assay—**

**Mobile phase—**Prepare a mixture of water, methanol, and 0.2 M monobasic ammonium phosphate (33:5:2). Pass through a filter having a 0.5- $\mu$ m or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation—**Dissolve an accurately weighed quantity of USP Cefonicid Sodium RS in *Mobile phase* to obtain a solution having a known concentration of about 200  $\mu$ g of cefonicid ( $C_{18}H_{18}N_6O_8S_3$ ) per mL.

**Assay preparation—**Transfer about 40 mg of Cefonicid Sodium, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Resolution solution—**Dissolve a quantity of USP Cefonicid Sodium RS in *Mobile phase* to obtain a solution containing about 0.2 mg per mL. Heat on a steam bath for 30 minutes, and cool. This *Resolution solution* contains a mixture of cefonicid and desacetyl cefonicid.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation* and the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution *R*, between the cefonicid and the desacetyl cefonicid peaks is not less than 1.1; the column efficiency determined from the analyte peak is not less than 1500 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2%.

**Procedure—**Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in  $\mu$ g, of cefonicid ( $C_{18}H_{18}N_6O_8S_3$ ) per mg of the Cefonicid Sodium taken by the formula:

$$200(C / M)(r_U / r_S)$$

in which *C* is the concentration, in  $\mu$ g per mL of cefonicid ( $C_{18}H_{18}N_6O_8S_3$ ) in the *Standard preparation*; *M* is the quantity, in mg, of Cefonicid Sodium taken to prepare the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

90.0 percent and not more than 120.0 percent of the labeled amount of cefonicid ( $C_{18}H_{18}N_6O_8S_3$ ).

**Packaging and storage—**Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards (11)—**

USP Cefonicid Sodium RS

USP Endotoxin RS

**Constituted solution—**At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Bacterial endotoxins** (85)—It contains not more than 0.35 USP Endotoxin Unit per mg of cefonicid.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements—**It responds to the *Identification* tests and meets the requirements for *Specific rotation*, *pH*, and *Water* under *Cefonicid Sodium*. It meets also the requirements for *Uniformity of Dosage Units* (905) and for *Labeling* under *Injections* (1).

**Assay—**

**Mobile phase—**Prepare a mixture of water, methanol, and 0.2 M monobasic ammonium phosphate (33:5:3). Pass through a filter having a 0.5- $\mu$ m or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation—**Dissolve an accurately weighed quantity of USP Cefonicid Sodium RS in *Mobile phase* to obtain a solution having a known concentration of about 200  $\mu$ g of cefonicid ( $C_{18}H_{18}N_6O_8S_3$ ) per mL.

**Assay preparation 1** (where it is represented as being in a single-dose container)—Constitute Cefonicid for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and quantitatively dilute with *Mobile phase* to obtain a solution containing about 200  $\mu$ g of cefonicid per mL.

**Assay preparation 2** (where the label states the quantity of cefonicid in a given volume of constituted solution)—Constitute Cefonicid for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Quantitatively dilute an accurately measured volume of the constituted solution with *Mobile phase* to obtain a solution containing about 200  $\mu$ g of cefonicid per mL.

**Resolution solution—**Dissolve a quantity of USP Cefonicid Sodium RS in *Mobile phase* to obtain a solution containing about 0.2 mg per mL. Heat on a steam bath for 30 minutes, and cool. This *Resolution solution* contains a mixture of cefonicid and desacetyl cefonicid.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation* and the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution *R*, between the cefonicid peak and the desacetyl cefonicid peak is not less than 1.1; the column efficiency determined from the analyte peak is not less than 1500 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2%.

**Procedure—**Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cefonicid ( $C_{18}H_{18}N_6O_8S_3$ ) withdrawn from the

**Cefonicid for Injection**

» Cefonicid for Injection contains an amount of Cefonicid Sodium equivalent to not less than

container, or in the portion of constituted solution taken by the formula:

$$(L / D)(C)(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of cefonicid in the container, or in the volume of constituted solution taken; *D* is the concentration, in µg per mL, of cefonicid in Assay preparation 1 or Assay preparation 2, based on the labeled quantity in the container or in the portion of constituted solution taken, respectively, and the extent of dilution; *C* is the concentration, in µg per mL, of cefonicid in the Standard preparation; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the relevant Assay preparation and the Standard preparation, respectively.

## Cefoperazone Sodium

$C_{25}H_{26}N_9NaO_8S_2$  667.65

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[(4-ethyl-2,3-dioxo-1-piperazinyl)carbonyl]amino]-(4-hydroxyphenyl)acetyl]amino]-3-[[[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-, monosodium salt, [6R-[6α, 7β(R\*)]]-

Sodium (6R,7R)-7-[(R)-2-(4-ethyl-2,3-dioxo-1-piperazinecarboxamido)-2-(p-hydroxyphenyl)acetamido-3-[[[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [62893-20-3].

» Cefoperazone Sodium contains the equivalent of not less than 870 µg and not more than 1015 µg of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Cefoperazone Dihydrate RS

USP Endotoxin RS

**Identification**—

**A:** The retention time of the major peak for cefoperazone in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

**B:** It responds to the tests for Sodium (191).

**Crystallinity** (695): meets the requirements.

**pH** (791): between 4.5 and 6.5, in a solution (1 in 4).

**Water, Method I** (921): not more than 5.0%.

**Other requirements**—Where the label states that Cefoperazone Sodium is sterile, it meets the requirements for Sterility and Bacterial endotoxins under Cefoperazone for Injection. Where the label states that Cefoperazone Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Cefoperazone for Injection.

**Assay**—

**Mobile phase**—Place 14 mL of triethylamine and 5.7 mL of glacial acetic acid in a 100-mL volumetric flask, dilute

with water to volume, and mix. Prepare a suitable mixture of water, acetonitrile, 1 N acetic acid, and this solution (876:120:2.8:1.2). Filter through a membrane filter (1-µm or finer porosity), and degas.

**Standard preparation**—Dissolve a suitable quantity of USP Cefoperazone Dihydrate RS, accurately weighed, in Mobile phase to obtain a solution having a known concentration of about 0.16 mg of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ) per mL.

**Assay preparation**—Using a suitable quantity of Cefoperazone Sodium, accurately weighed, proceed as directed under Standard preparation.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.0-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed under Procedure: the relative standard deviation for replicate injections is not more than 2.0%, and the tailing factor is not more than 1.5.

**Procedure**—Separately inject equal volumes (about 10 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg of cefoperazone per mg, of the Cefoperazone Sodium taken by the formula:

$$1000(C / M)(r_U / r_S)$$

in which *C* is the concentration, in mg of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ) per mL, of the Standard preparation; *M* is the concentration, in mg per mL, of the Assay preparation based on the weight of Cefoperazone Sodium taken and the extent of dilution; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses from the Assay preparation and the Standard preparation, respectively.

## Cefoperazone Injection

» Cefoperazone Injection is a sterile solution of Cefoperazone Sodium and a suitable osmolality adjusting substance in Water for Injection. It may contain a suitable buffer. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ).

**Packaging and storage**—Preserve in Containers for Injections as described under Injections (1). Maintain in the frozen state.

**Labeling**—It meets the requirements for Labeling under Injections (1). The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

**USP Reference standards** (11)—

USP Cefoperazone Dihydrate RS

USP Endotoxin RS

**Identification**—The retention time of the major peak for cefoperazone in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

**Bacterial endotoxins** (85)—It contains not more than 0.2 USP Endotoxin Unit per mg of cefoperazone.

**Sterility** (71)—It meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined.

**pH** <791>: between 4.5 and 6.5.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Assay—**

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under *Cefoperazone Sodium*.

*Assay preparation*—Quantitatively dilute an accurately measured volume of Injection with *Mobile phase* to obtain a solution containing about 0.16 mg of cefoperazone per mL.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Cefoperazone Sodium*. Calculate the quantity, in mg, of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ), in the volume of Injection taken by the formula:

$$(L / D)(C)(r_u / r_s)$$

in which *L* is the labeled quantity, in mg, of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ), in the volume of Injection taken; *D* is the concentration, in mg of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ) per mL, of the *Assay preparation*, based on the labeled quantity in the portion of Injection taken and the extent of dilution; and the other terms are as defined therein.

## Cefoperazone for Injection

» Cefoperazone for Injection contains an amount of Cefoperazone Sodium equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* <1>.

**USP Reference standards** <11>—

USP Cefoperazone Dihydrate RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

**Bacterial endotoxins** <85>—It contains not more than 0.20 USP Endotoxin Unit per mg of cefoperazone.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** <791>: between 4.5 and 6.5, in a solution (1 in 4).

**Water, Method I** <921>: not more than 5.0%, except that where it is in the freeze-dried form, the limit is not more than 2.0%.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements for the *Identification* tests under *Cefoperazone Sodium* and meets the requirements for *Uniformity of Dosage Units* <905> and for *Labeling* under *Injections* <1>.

**Assay—**

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay under *Cefoperazone Sodium*.

*Assay preparation 1* (where it is represented as being in a single-dose container)—Constitute Cefoperazone for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and quantitatively dilute with *Mobile phase* to obtain a solution containing about 0.16 mg of cefoperazone per mL.

*Assay preparation 2* (where the label states the quantity of cefoperazone in a given volume of constituted solution)—Constitute Cefoperazone for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Quantitatively dilute an accurately measured volume of the constituted solution with *Mobile phase* to obtain a solution containing about 0.16 mg of cefoperazone per mL.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in  $\mu$ g of cefoperazone per mg, of the Cefoperazone for Injection taken by the formula:

$$1000(C / M)(r_u / r_s)$$

in which *C* is the concentration, in mg of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ) per mL, of the *Standard preparation*; *M* is the concentration, in mg per mL, of the *Assay preparation* based on the weight of Cefoperazone for Injection taken and the extent of dilution; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ), withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$(L / D)(C)(r_u / r_s)$$

in which *L* is the labeled quantity, in mg, of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ), in the container, or in the volume of constituted solution taken; and *D* is the concentration, in mg of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ ) per mL, of *Assay preparation 1* or *Assay preparation 2*, based on the labeled quantity in the container or in the portion of constituted solution taken, respectively, and the extent of dilution; and the other terms are as defined therein.

## Ceforanide

$C_{20}H_{21}N_7O_6S_2$  519.55

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[2-(aminomethyl)phenyl]acetyl]amino]-3-[[[1-(carboxymethyl)1H-tetrazol-5-yl]thio]methyl]-8-oxo-, (6*R*-trans)-, (6*R*,7*R*)-7-[2-( $\alpha$ -Amino-*o*-tolyl)acetamido]-3-[[[1-(carboxymethyl)-1H-tetrazol-5-yl]thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid. 7-[*o*-(Aminomethyl)phenylacetamido]-3-[[[1-(carboxymethyl)-1H-tetrazol-5-yl]thio]methyl]-3-cephem-4-carboxylic acid [60925-61-3].

» Ceforanide contains not less than 900  $\mu$ g and not more than 1050  $\mu$ g of ceforanide ( $C_{20}H_{21}N_7O_6S_2$ ) per mg.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** <11>—

USP Ceforanide RS

USP Endotoxin RS

**Identification—**

**A:** *Infrared Absorption* (197M).

**B:** The retention time of the major peak for ceforanide in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—Where the label states that Ceforanide is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains not more than 0.25 USP Endotoxin Unit per mg of ceforanide.

**Sterility** (71)—Where the label states that Ceforanide is sterile, it meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, except to dissolve 6 g of Ceforanide in *Fluid A* to each 1000 mL of which has been added 10 g of sterile L-lysine, and to rinse the membrane with three 100-mL portions of *Fluid D* and one 100-mL portion of *Fluid A*.

**pH** (791): between 2.5 and 4.5, in a suspension containing 50 mg per mL.

**Water, Method I** (921): not more than 5.0%.

**Assay—**

**Mobile phase**—Mix 18 mL of tetrabutylammonium hydroxide solution (1 in 10) and 8.6 mL of 11 N potassium hydroxide, and add the mixture to 700 mL of water. Add 200 mL of methanol, adjust with phosphoric acid to a pH of 7.0, and add water to obtain 1000 mL of solution, making adjustments if necessary (see *System Suitability* under *Chromatography* (621)). Filter, using a filter having a porosity of 1  $\mu$ m or finer, and degas.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ceforanide RS in *Mobile phase* to obtain a solution having a known concentration of about 1 mg per mL. Use this solution within 5 minutes.

**Assay preparation**—Using a suitable quantity of Ceforanide, accurately weighed, proceed as directed under *Standard preparation*. Use this solution within 5 minutes.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains 5- to 10- $\mu$ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the analyte peak is not less than 1900 theoretical plates; the tailing factor for the analyte peak is not more than 1.2; the capacity factor,  $k'$ , is not less than 1.8 and not more than 5.0; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in  $\mu$ g, of  $C_{20}H_{21}N_7O_6S_2$  in each mg of the Ceforanide taken by the formula:

$$(CP / M)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Ceforanide RS in the *Standard preparation*; P is the potency, in  $\mu$ g per mg, of the USP Ceforanide RS; M is the concentration, in mg per mL, of the *Assay preparation*, based on the amount of Ceforanide taken and the extent of dilution; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Ceforanide for Injection**

» Ceforanide for Injection is a sterile mixture of Ceforanide and L-lysine. It contains not less than 900  $\mu$ g and not more than 1050  $\mu$ g of ceforanide ( $C_{20}H_{21}N_7O_6S_2$ ) per mg on the L-lysine-free basis, and not less than 90.0 percent and not more than 115.0 percent of the labeled amount of  $C_{20}H_{21}N_7O_6S_2$ .

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Ceforanide RS

USP Endotoxin RS

**Identification—**

**A:** The retention time of the major peak for L-lysine in the chromatogram of the *Test preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the test for *Content of L-lysine*.

**B:** The retention time of the major peak in ceforanide in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*; as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.25 USP Endotoxin Unit per mg of ceforanide.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, except to constitute each container with 3 mL of *Fluid A* for each g of ceforanide contained therein, and to rinse the membrane with three 100-mL portions of *Fluid D* and one 100-mL portion of *Fluid A*.

**pH** (791): between 5.5 and 8.5, when constituted as directed in the labeling.

**Water, Method I** (921): not more than 3.0%.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Content of L-lysine—**

**Mobile phase**—Mix 62 volumes of methanol and 38 volumes of water, and adjust with glacial acetic acid to a pH of 3.0, making adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Stock standard solution**—Transfer about 36 mg of L-lysine, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Standard preparation**—Transfer 2.0 mL of *Stock standard solution* to a glass-stoppered, 10-mL volumetric flask, add 2.0 mL of a 1.4% solution of tris(hydroxymethyl)aminomethane and 3.0 mL of a 1.5% solution of 1-fluoro-2,4-dinitrobenzene in dehydrated alcohol, insert the stopper tightly, and mix. Heat at 50° in a water bath for 30 minutes. Remove the flask from the water bath, allow to cool, dilute with methanol to volume, and mix.

**Test preparation**—Transfer about 150 mg of Ceforanide for Injection, accurately weighed, to a 100-mL volumetric flask, add water to volume, and mix. Transfer 2.0 mL of the resulting solution to a glass-stoppered, 10-mL volumetric flask, and proceed as directed under *Standard preparation*, beginning with "add 2.0 mL of a 1.4% solution of tris(hydroxymethyl)aminomethane."

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- to 10- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the derivatized L-lysine peak is not less than 1500 theoretical plates; the tailing factor for the same

**Other requirements**—Where the label states that Cefotaxime Sodium is sterile, it meets the requirements for *Sterility* (71) when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*, and for *Bacterial endotoxins under Cefotaxime for Injection*. Where the label states that Cefotaxime Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins under Cefotaxime for Injection*.

**Assay**—

**0.05 M Phosphate Buffer**—Dissolve 7.1 g of anhydrous dibasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 6.25.

**Solution A**—Prepare a mixture of 0.05 M Phosphate Buffer and methanol (86:14). Pass through a filter having a porosity of 0.5 µm or less, and degas before use.

**Solution B**—Prepare a mixture of 0.05 M Phosphate Buffer and methanol (60:40). Pass through a filter having a porosity of 0.5 µm or less, and degas before use.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*.

**Standard preparation**—Transfer about 40 mg of USP Cefotaxime Sodium RS, accurately weighed, to a 50-mL volumetric flask, add about 40 mL of *Solution A*, swirl to dissolve, dilute with *Solution A* to volume, and mix. [NOTE—Use this solution promptly. It may be used within 24 hours if stored in the refrigerator.]

**Sensitivity solution**—Transfer 2.0 mL of *Standard preparation* to a 100-mL volumetric flask, dilute with *Solution A* to volume, and mix. Transfer 2.0 mL of this solution to a 20-mL volumetric flask, dilute with *Solution A* to volume, and mix.

**Resolution solution**—Mix 1 mL of *Standard preparation*, 7.0 mL of water, and 2.0 mL of methanol. Add 25 mg of sodium carbonate, mix, and allow to stand at room temperature for 10 minutes, with occasional swirling. Add 3 drops of glacial acetic acid and 1 mL of *Standard preparation*, and mix.

**Assay preparation**—Transfer about 40 mg of Cefotaxime Sodium, accurately weighed, to a 50-mL volumetric flask, add *Solution A* to dissolve it, dilute with *Solution A* to volume, and mix. [NOTE—Use this solution promptly. It may be used within 24 hours if stored in a refrigerator.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 235-nm detector and a 3.9-mm × 15-cm column that contains 5-µm packing L1 and is maintained at a constant temperature of about 30°. The flow rate is about 1 mL per minute. The system is equilibrated with 100% *Solution A*. Seven minutes after injection of the solution under test, the proportion of *Solution B* is increased linearly from 0% to 20% at a rate of 10% per minute and is maintained at that composition for 7 minutes. The proportion of *Solution B* is then increased linearly at a rate of 2.7% per minute until the proportion of *Solution B* is 100%, and is held at that composition for 5 minutes, after which the proportion of *Solution A* is increased linearly to 100% at a rate of 20% per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the retention times are about 3.5 minutes for desacetylcefotaxime and 14 minutes for cefotaxime, and the resolution,  $R$ , between the two peaks is not less than 20. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the retention time for the main cefotaxime peak is between 12 and 15 minutes, the tailing factor is not more than 2, and the relative standard deviation for replicate injections is not more than 1.5%. Chromatograph the *Sensitivity solution*, and record the peak responses as directed under *Procedure*: the response of the cefotaxime peak is between 0.18% and 0.22% of the response of the cefotaxime peak in the chromatogram obtained from the *Standard preparation*.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg per mg, of cefotaxime ( $C_{16}H_{17}N_5O_7S_2$ ) in the portion of Cefotaxime Sodium taken by the formula:

$$50(CP / W)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Cefotaxime Sodium RS in the *Standard preparation*;  $P$  is the designated content, in µg per mg, of cefotaxime ( $C_{16}H_{17}N_5O_7S_2$ ) in USP Cefotaxime Sodium RS;  $W$  is the weight, in mg, of Cefotaxime Sodium taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the cefotaxime peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefotaxime Injection

» Cefotaxime Injection is a sterile solution of Cefotaxime Sodium in Water for Injection. It contains one or more suitable buffers, and it may contain Dextrose or Sodium Chloride as a tonic-ity-adjusting agent. It contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cefotaxime ( $C_{16}H_{17}N_5O_7S_2$ ).

**Packaging and storage**—Preserve in single-dose containers, as described under *Injections* (1). Maintain in the frozen state.

**Labeling**—It meets the requirements for *Labeling* under *Injections* (1). The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

**USP Reference standards** (11)—

USP Cefotaxime Sodium RS

USP Endotoxin RS

**Identification**—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for cefotaxime, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.20 USP Endotoxin Unit per mg of cefotaxime.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

**pH** (791): between 5.0 and 7.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Chromatographic purity**—Using the chromatogram of the *Assay preparation* obtained in the *Assay*, calculate the percentage of each impurity by the formula:

$$100r_i / (r_{is} + r_c)$$

in which  $r_i$  is the peak area response of a given impurity;  $r_{is}$  is the sum of all of the impurity peak area responses; and  $r_c$  is the peak area response for the main cefotaxime peak. [NOTE—Disregard any impurity peak that is less than 0.1%.] Not more than 6.0% of any individual impurity is found, and the sum of all impurities found is not more than 10.0%.

**Assay—**

0.05 M Phosphate buffer, Solution A, Solution B, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Prepare as directed in the Assay under Cefotaxime Sodium.

**Assay preparation**—Allow 1 container of Injection to thaw, and mix. Transfer an accurately measured volume of the Injection, equivalent to about 80 mg of cefotaxime ( $C_{16}H_{17}N_5O_7S_2$ ), to a 100-mL volumetric flask, dilute with Solution A to volume, and mix.

**Procedure**—Proceed as directed for Procedure in the Assay under Cefotaxime Sodium. Calculate the quantity, in mg, of cefotaxime ( $C_{16}H_{17}N_5O_7S_2$ ) in each mL of the Injection taken by the formula:

$$0.1(CP / V)(r_U / r_S)$$

in which  $V$  is the volume, in mL, of Injection taken, to prepare the Assay preparation, and the other terms are as defined therein.

## Cefotaxime for Injection

» Cefotaxime for Injection contains an amount of Cefotaxime Sodium equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of cefotaxime ( $C_{16}H_{17}N_5O_7S_2$ ).

**Packaging and storage**—Preserve in Containers for Sterile Solids as described under Injections (1).

**USP Reference standards (11)—**

USP Cefotaxime Sodium RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for Constituted Solutions under Injections (1).

**Identification—**

WHERE THE LABEL INDICATES THAT THERE ARE NO ADDED SUBSTANCES—

A: Infrared Absorption (197K).

B: It responds to the tests for Sodium (191).

WHERE THE LABEL INDICATES THAT THERE ARE ADDED SUBSTANCES—

C: It responds to Identification test B under Cefotaxime Sodium.

**Bacterial endotoxins (85)**—It contains not more than 0.20 USP Endotoxin Unit per mg of cefotaxime.

**Sterility (71)**—It meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined.

**Uniformity of dosage units (905)**—meets the requirements.

**Particulate matter (788)**: meets the requirements for small-volume injections.

**Chromatographic purity**—Using the chromatogram of the Assay preparation obtained in the Assay, calculate the percentage of each impurity by the formula:

$$100r_i / (r_s + r_c)$$

in which  $r_i$  is the peak area response of a given impurity;  $r_s$  is the sum of all the impurity peak area responses; and  $r_c$  is the peak area response for the main cefotaxime peak. [NOTE—Disregard any impurity peak that is less than 0.1%.] Not more than 6.0% of any individual impurity is found, and the sum of all impurities found is not more than 10.0%.

**Other requirements**—It meets the requirements for pH and Loss on drying under Cefotaxime Sodium and for Labeling under Injections (1).

**Assay—**

0.05 M Phosphate buffer, Solution A, Solution B, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Prepare as directed in the Assay under Cefotaxime Sodium.

**Assay preparation 1** (for use where the Weight Variation test is to be performed)—Transfer about 40 mg of Cefotaxime for Injection, accurately weighed, to a 50-mL volumetric flask, add about 40 mL of Solution A, swirl to dissolve, dilute with Solution A to volume, and mix. [NOTE—Use this solution promptly. It may be used within 24 hours if stored in the refrigerator.]

**Assay preparation 2** (for use in assaying vials and infusion bottles packaged for dispensing)—Constitute 1 container of Cefotaxime for Injection with the smallest volume of diluent specified in the labeling. Invert the container, and withdraw all of the withdrawable contents of the container with a hypodermic needle and syringe. Transfer the contents of the syringe to a 100-mL volumetric flask, dilute with Solution A to volume, and mix. [NOTE—Do not rinse the syringe or container.] Dilute an accurately measured volume of this solution quantitatively with Solution A to obtain a solution having a concentration of about 0.8 mg of cefotaxime ( $C_{16}H_{17}N_5O_7S_2$ ) per mL. [NOTE—Use this solution promptly. It may be used within 24 hours if stored in the refrigerator.]

**Assay preparation 3** (for use in assaying piggyback infusion bottles)—Constitute 1 container of Cefotaxime for Injection with the smallest volume of diluent recommended in the labeling, using the directions specified in the labeling. Proceed as directed for Assay preparation beginning with "Invert the container. . ."

**Assay preparation 4** (for use in assaying pharmacy bulk packages where the label states the quantity of cefotaxime in a given volume of constituted solution)—Constitute 1 container of Cefotaxime for Injection with the volume of diluent, accurately measured, specified in the labeling. With a hypodermic needle and syringe, withdraw an accurately measured portion of the resultant solution, equivalent to about 1000 mg of cefotaxime, to a 100-mL volumetric flask, dilute with Solution A to volume, and mix. [NOTE—Do not rinse the syringe or container.] Dilute an accurately measured volume of this solution quantitatively with Solution A to obtain a solution having a concentration of about 0.8 mg of cefotaxime ( $C_{16}H_{17}N_5O_7S_2$ ) per mL. [NOTE—Use this solution promptly. It may be used within 24 hours if stored in the refrigerator.]

**Procedure**—Proceed as directed for Procedure in the Assay under Cefotaxime Sodium. Calculate the quantity, in  $\mu$ g, of cefotaxime ( $C_{16}H_{17}N_5O_7S_2$ ) in each mg of the Cefotaxime for Injection taken by the formula:

$$50(CP / W)(r_U / r_S)$$

in which  $W$  is the weight, in mg, of the Cefotaxime for Injection taken, and the other terms are as defined therein. Calculate the quantity, in mg, of cefotaxime in the container, and in the portion of constituted solution taken by the formula:

$$(CP)(L/1000D)(r_U / r_S)$$

in which  $L$  is the labeled quantity, in mg, of cefotaxime in the container, or in the volume of constituted solution taken; and  $D$  is the concentration, in mg per mL, of cefotaxime in Assay preparation 2 or in Assay preparation 3, or in Assay preparation 4, on the basis of the labeled quantity in the container, or in the portion of constituted solution taken, respectively; and the extent of dilution, and the other terms are as defined therein. Where the test for Uniformity of dosage units has been performed using the Procedure for

content uniformity, use the average of these determinations as the Assay value.

## Cefotetan

$C_{17}H_{17}N_7O_8S_4$  575.62

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[4-(2-amino-1-carboxy-2-oxoethylidene)-1,3-dithietan-2-yl]carbonyl]amino]-7-methoxy-3-[[[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-, [6R-(6 $\alpha$ ,7 $\alpha$ )]-, (6R,7S)-4-[[2-Carboxy-7-methoxy-3-[[[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-en-7-yl]carbamoyl]-1,3-dithietane- $\Delta^{2,\alpha}$ -malonic acid, (6R,7S)-7-[4-(Carbamoylcarboxymethylene)-1,3-dithietane-2-carboxamido]-7-methoxy-3-[[[(1-methyl-1H-tetrazol-5-yl)thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid [69712-56-7].

» Cefotetan contains not less than 950  $\mu$ g and not more than 1030  $\mu$ g of cefotetan ( $C_{17}H_{17}N_7O_8S_4$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Cefotetan RS

USP Endotoxin RS

**Identification**—

**A:** Infrared Absorption (197M).

**B:** The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that observed in the chromatogram of the Standard preparation obtained as directed in the Assay.

**Water**, Method I (921): not more than 2.5%.

**Sterility** (71) (where it is labeled as sterile)—It meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined, except to use Fluid A to each 1000 mL of which has been added 10 g of sodium bicarbonate before sterilization.

**Other requirements**—Where the label states that Cefotetan is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Cefotetan for Injection.

**Assay**—[NOTE—Protect the Standard preparation, the Resolution solution, and the Assay preparation from light, and use within 2 hours.]

**Mobile phase**—Prepare a filtered and degassed mixture of 0.1 M phosphoric acid, methanol, acetonitrile, and glacial acetic acid (1700:105:105:100). Make adjustments if necessary (see System Suitability under Chromatography (621)).

**Standard preparation**—Transfer about 20 mg of USP Cefotetan RS, accurately weighed, to a 100-mL volumetric flask, add 5 mL of methanol, swirl for several minutes, add 5 mL of acetonitrile, and swirl until dissolved. Dilute with water to volume, and mix.

**Resolution solution**—Place 10 mL of Standard preparation in a glass-stoppered flask containing a few mg of magnesium carbonate, and sonicate for 10 minutes. If the solution is not turbid, add a few more mg of magnesium carbonate, and repeat the sonication. Filter the turbid solution through a filter of 0.5  $\mu$ m or finer porosity. Collect the clear filtrate, and use as the Resolution solution.

**Assay preparation**—Using a suitable quantity of Cefotetan, accurately weighed, proceed as directed for Standard preparation.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph 20  $\mu$ L of the Resolution solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.75 for cefotetan and 1.0 for cefotetan tautomer; and the resolution between the cefotetan peak and the cefotetan tautomer peak is not less than 2.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency is not less than 1500 theoretical plates, the tailing factor is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas of the responses for the major peaks. Calculate the quantity, in  $\mu$ g, of cefotetan ( $C_{17}H_{17}N_7O_8S_4$ ) in each mg of the Cefotetan taken by the formula:

$$200(CP / M)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cefotetan RS in the Standard preparation; P is the designated potency, in  $\mu$ g of cefotetan ( $C_{17}H_{17}N_7O_8S_4$ ) per mg, of USP Cefotetan RS; M is the weight, in mg, of Cefotetan taken to prepare the Assay preparation; and  $r_U$  and  $r_S$  are the cefotetan peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Cefotetan Injection

» Cefotetan Injection is a sterile isoosmotic solution of Cefotetan and Sodium Bicarbonate in Water for Injection. It contains one or more buffer substances and a tonicity-adjusting agent. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cefotetan ( $C_{17}H_{17}N_7O_8S_4$ ).

**Packaging and storage**—Preserve in Containers for Injections as described under Injections (1). Maintain in the frozen state.

**Labeling**—It meets the requirements for Labeling under Injections (1). The label states that it is to be thawed just prior to use, describes the conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

**USP Reference standards** (11)—

USP Cefotetan RS

USP Endotoxin RS

**Identification**—The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that observed in the chromatogram of the Standard preparation obtained as directed in the Assay.

**Bacterial endotoxins** (85)—It contains not more than 0.17 USP Endotoxin Unit per mg of cefotetan.

**Sterility**  $\langle 71 \rangle$ —It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH**  $\langle 791 \rangle$ : between 4.0 and 6.5.

**Particulate matter**  $\langle 788 \rangle$ : meets the requirements for small-volume injections.

#### Assay—

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the Assay under *Cefotetan*.

*Assay preparation*—Allow the contents of a container of Injection to thaw, and mix the resultant solution. Transfer an accurately measured volume of this solution, equivalent to about 40 mg of cefotetan, to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. [NOTE—Use this solution within 10 minutes.]

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Cefotetan*. Calculate the quantity, in mg, of cefotetan ( $C_{17}H_{17}N_7O_8S_4$ ) in each mL of the Injection taken by the formula:

$$0.2(CP / V)(r_U / r_S)$$

in which  $V$  is the volume, in mL, of Injection taken to prepare the *Assay preparation*, and the other terms are as defined therein.

## Cefotetan for Injection

### DEFINITION

Cefotetan for Injection contains an amount of Cefotetan Disodium equivalent to NLT 90.0% and NMT 120.0% of the labeled amount of cefotetan ( $C_{17}H_{17}N_7O_8S_4$ ).

### IDENTIFICATION

- A.** The retention time of the major peak of the appropriate *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- B. IDENTIFICATION TESTS—GENERAL, Sodium**  $\langle 191 \rangle$ : Meets the requirements

### ASSAY

#### PROCEDURE

[NOTE—Protect the *Standard solution*, the *System suitability solution*, *Sample solution A*, and *Sample solution B* from light, and use within 2 h.]

**Solution A:** Acetonitrile, methanol, and water (1:1:18)

**Mobile phase:** Acetonitrile, methanol, glacial acetic acid, and 0.1 M phosphoric acid (105:105:100:1700)

**Standard solution:** 20 mg of USP Cefotetan RS in a 100-mL volumetric flask. Add 5 mL of methanol, swirl for several min, add 5 mL of acetonitrile, and swirl until dissolved. Dilute with water to volume.

**System suitability solution:** 10 mL of *Standard solution* in a glass-stoppered flask containing a few mg of magnesium carbonate. Sonicate for 10 min. If the solution is not turbid, add a few more mg of magnesium carbonate, and repeat the sonication. Filter the turbid solution through a filter of 0.5- $\mu$ m or finer pore size. Use the clear filtrate.

**Sample solution A** (where the package is represented as being in a single-dose container): Constitute Cefotetan for Injection as directed in the labeling. Withdraw all of the withdrawable contents, and quantitatively dilute with *Solution A* to obtain a solution containing the equivalent of 200  $\mu$ g/mL of cefotetan.

**Sample solution B** (where the label states the quantity of cefotetan in a given volume of constituted solu-

tion): Constitute Cefotetan for Injection as directed in the labeling. Dilute an aliquot of the constituted solution with *Solution A* to obtain a solution containing the equivalent of 200  $\mu$ g/mL of cefotetan.

#### Chromatographic system

(See *Chromatography*  $\langle 621 \rangle$ , *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Flow rate:** 2 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for cefotetan and cefotetan tautomer are 0.75 and 1.0, respectively, *System suitability solution*.]

#### Suitability requirements

**Resolution:** NLT 2.0 between cefotetan and cefotetan tautomer, *System suitability solution*

**Column efficiency:** NLT 1500 theoretical plates, *Standard solution*

**Tailing factor:** NMT 1.5, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution*, and *Sample solution A* or *Sample solution B*

Calculate the percentage of  $C_{17}H_{17}N_7O_8S_4$  withdrawn from the container, or in the portion of solution taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response from *Sample solution A* or *Sample solution B*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Cefotetan RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of cefotetan in *Sample solution A* or *Sample solution B* ( $\mu$ g/mL)

**Acceptance criteria:** 90.0%–120.0%

### PERFORMANCE TESTS

- UNIFORMITY OF DOSAGE UNITS**  $\langle 905 \rangle$ : Meets the requirements

### SPECIFIC TESTS

- INJECTIONS, Constituted Solutions**  $\langle 1 \rangle$ : Meets the requirements at the time of use
- BACTERIAL ENDOTOXINS TEST**  $\langle 85 \rangle$ : NMT 0.17 USP Endotoxin Unit/mg of cefotetan
- STERILITY TESTS**  $\langle 71 \rangle$ : Meets the requirements when tested as directed for *Test for Sterility of the Product to be Examined, Membrane Filtration*
- PARTICULATE MATTER IN INJECTIONS**  $\langle 788 \rangle$ : Meets the requirements for small-volume injections
- pH**  $\langle 791 \rangle$ : 4.0–6.5, in a solution 100 mg/mL
- WATER DETERMINATION, Method Ic**  $\langle 921 \rangle$ : NMT 2.8%
- OTHER REQUIREMENTS:** It meets the requirements under *Injections*  $\langle 1 \rangle$ , *Labels and Labeling*.

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve as described under *Injections*  $\langle 1 \rangle$ , *Containers for Sterile Solids*.
- USP REFERENCE STANDARDS**  $\langle 11 \rangle$   
USP Cefotetan RS  
USP Endotoxin RS

## Cefotetan Disodium

$C_{17}H_{15}N_7Na_2O_8S_4$  619.58

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[4-(2-amino-1-carboxy-2-oxoethylidene)-1,3-dithietan-2-yl]carbonyl]amino]-7-methoxy-3-[[[(1-methyl-1*H*-tetrazol-5-yl)thio]methyl]-8-oxo-, disodium salt, [6*R*-(6 $\alpha$ ,7 $\alpha$ )]-. (6*R*,7*S*)-4-[[[2-Carboxy-7-methoxy-3-[[[(1-methyl-1*H*-tetrazol-5-yl)thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-en-7-yl]carbamoyl]-1,3-dithietane- $\Delta^{2,\alpha}$ -malonic acid, disodium salt. (6*R*,7*S*)-7-[4-(Carbamoylcarboxymethylene)-1,3-dithietane-2-carboxamido]-7-methoxy-3-[[[(1-methyl-1*H*-tetrazol-5-yl)thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, disodium salt [74356-00-6].

» Cefotetan Disodium contains the equivalent of not less than 830  $\mu$ g and not more than 970  $\mu$ g of cefotetan ( $C_{17}H_{17}N_7O_8S_4$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Cefotetan RS  
USP Endotoxin RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay*.

**B:** It responds to the tests for *Sodium* (191).

**pH** (791): between 4.0 and 6.5, in a solution (1 in 10).

**Water, Method 1c** (921): not more than 2.5%.

**Other requirements**—Where the label states that Cefotetan Disodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Cefotetan for Injection*. Where the label states that Cefotetan Disodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Cefotetan for Injection*.

**Assay**—[NOTE—Protect the *Standard preparation*, the *Resolution solution*, and the *Assay preparations* from light, and use within 2 hours.]

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Cefotetan*.

*Assay preparation*—Transfer about 40 mg of Cefotetan Disodium, accurately weighed, to a 200-mL volumetric flask, add 10 mL of methanol, swirl for several minutes, add 10 mL of acetonitrile, and swirl until dissolved. Dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Cefotetan*. Calculate the quantity, in  $\mu$ g, of cefotetan

( $C_{17}H_{17}N_7O_8S_4$ ) per mg in the portion of Cefotetan Disodium taken by the formula:

$$200(CP / M)(r_U / r_S)$$

in which the terms are as defined therein.

## Cefotiam Hydrochloride

$C_{18}H_{23}N_9O_4S_3 \cdot 2HCl$  598.55

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[(2-amino-4-thiazolyl)acetyl]-amino]-3-[[[1-[2-(dimethylamino)ethyl]-1*H*-tetrazol-5-yl]-thio]methyl]-8-oxo, hydrochloride, (6*R*-*trans*)-. (6*R*,7*R*)-7-[2-(2-Amino-4-thiazolyl)acetamido]-3-[[[1-[2-(dimethylamino)ethyl]-1*H*-tetrazol-5-yl]thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid dihydrochloride. 7(*R*)-[2-(2-Amino-4-thiazolyl)acetamido]-3-[[[1-[2-(dimethylamino)ethyl]-1*H*-tetrazol-5-yl]thio]methyl]-3-cephem-4-carboxylic acid dihydrochloride [66309-69-1].

» Cefotiam Hydrochloride contains the equivalent of not less than 790  $\mu$ g and not more than 925  $\mu$ g of cefotiam ( $C_{18}H_{23}N_9O_4S_3$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Cefotiam Hydrochloride RS

**Identification**—

**A:** *Ultraviolet Absorption* (197U)—

*Solution:* 20  $\mu$ g per mL.

*Medium:* water.

**B:** The retention time of the cefotiam peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Crystallinity** (695): meets the requirements.

**Pyrogen**—Where the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements of the *Pyrogen Test* (151), the test dose being 1.0 mL per kg of a solution in pyrogen-free sodium carbonate solution (prepared by dissolving 25.6 g of sodium carbonate, previously heated at 170° for not less than 4 hours, in 1000 mL of Sterile Water for Injection) containing 40 mg per mL.

**Sterility** (71)—Where the label states that it is sterile, it meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Water, Method 1** (921): not more than 7.0%, the *Test Preparation* being prepared as directed for a hygroscopic specimen, except to use a mixture of 20 mL of formamide (previously dried over anhydrous sodium sulfate for 24 hours) and methanol (2:1), instead of methanol, to dissolve the specimen, and to determine the water content of the formamide and methanol mixture.

**Assay—**

**Mobile phase**—Dissolve 13.1 g of ammonium sulfate in 850 mL of water, adjust with 2 N ammonium hydroxide to a pH of  $6.5 \pm 0.1$ , add 150 mL of acetonitrile, and mix. Filter through a suitable filter of 0.5  $\mu\text{m}$  or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cefotiam Hydrochloride RS, quantitatively in water to obtain a solution having a known concentration of about 1000  $\mu\text{g}$  of cefotiam ( $\text{C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3$ ) per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains the equivalent of about 50  $\mu\text{g}$  of cefotiam ( $\text{C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3$ ) per mL. Use this solution without delay.

**Assay preparation**—Transfer about 60 mg of Cefotiam Hydrochloride, accurately weighed, to a 50-mL volumetric flask, add water to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Use this solution without delay.

**System suitability solution**—Prepare a solution of USP Cefotiam Hydrochloride RS in water containing about 1 mg per mL. Heat this solution at  $95^\circ$  for 3 minutes, and cool. Transfer 1 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency, determined from the cefotiam peak, is not less than 1985 theoretical plates when calculated by the formula:

$$5.545(t_r / W_{h/2})^2$$

the tailing factor for the cefotiam peak is not more than 1.8, and the relative standard deviation for replicate injections is not more than 1.0%. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for de-tetrazol-cefotiam and 1.0 for cefotiam; and the resolution,  $R$ , between the de-tetrazol-cefotiam peak and the cefotiam peak is not less than 4.0.

**Procedure**—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in  $\mu\text{g}$ , of cefotiam ( $\text{C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3$ ) in each mg of the Cefotiam Hydrochloride taken by the formula:

$$1000(C/W)(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of cefotiam ( $\text{C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3$ ) in the *Standard preparation*, based on the quantity of USP Cefotiam Hydrochloride RS taken to prepare the *Standard preparation*, the designated cefotiam ( $\text{C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3$ ) content, in  $\mu\text{g}$  per mg, of USP Cefotiam Hydrochloride RS, and the extent of dilution;  $W$  is the weight, in mg, of Cefotiam Hydrochloride taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the cefotiam peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefotiam for Injection

» Cefotiam for Injection contains an amount of Cefotiam Hydrochloride equivalent to not less than 90.0 percent and not more than 120.0 per-

cent of the labeled amount of cefotiam ( $\text{C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3$ ). It may contain Sodium Carbonate.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Cefotiam Hydrochloride RS

**Identification—**

**A: Ultraviolet Absorption** (197U)—

*Solution:* 20  $\mu\text{g}$  per mL.

*Medium:* water.

**B:** The retention time of the cefotiam peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*; as obtained in the *Assay*.

**Pyrogen**—It meets the requirements of the *Pyrogen Test* (151), the test dose being 1.0 mL per kg of a solution prepared by diluting Cefotiam for Injection with Sterile Water for Injection to a concentration of 40 mg of cefotiam per mL.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 5.7 and 7.2, in a solution containing the equivalent of 100 mg of cefotiam per mL.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in vacuum at a pressure not exceeding 5 mm of mercury at  $60^\circ$  for 3 hours: it loses not more than 6.0% of its weight.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Assay—**

**Mobile phase, Standard preparation, System suitability solution, and Chromatographic system**—Prepare as directed in the *Assay* under *Cefotiam Hydrochloride*.

**Assay preparation 1** (where it is represented as being in a single-dose container)—Constitute a container of Cefotiam for Injection in a volume of water, accurately measured, corresponding to the volume of diluent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with water to obtain a solution containing the equivalent of about 1 mg of cefotiam ( $\text{C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3$ ) per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains the equivalent of about 50  $\mu\text{g}$  of cefotiam per mL. Use this solution without delay.

**Assay preparation 2** (where the label states the quantity of cefotiam in a given volume of constituted solution)—Constitute a container of Cefotiam for Injection in a volume of water, accurately measured, equivalent to the volume of diluent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with water to obtain a solution containing about 1 mg of cefotiam ( $\text{C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3$ ) per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains the equivalent of about 50  $\mu\text{g}$  of cefotiam per mL. Use this solution without delay.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Cefotiam Hydrochloride*. Calculate the quantity, in mg, of cefotiam ( $\text{C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3$ ) withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$C(L / D)(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of cefotiam ( $\text{C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3$ ) in the *Standard preparation*, based on the quantity of USP Cefotiam Hydrochloride RS taken to prepare

the *Standard preparation*, the designated cefotiam ( $C_{18}H_{23}N_9O_4S_3$ ) content, in  $\mu\text{g}$  per mg, of USP Cefotiam Hydrochloride RS, and the extent of dilution;  $L$  is the labeled quantity, in mg, of cefotiam ( $C_{18}H_{23}N_9O_4S_3$ ) in the container, or in the volume of constituted solution taken;  $D$  is the concentration, in  $\mu\text{g}$  of cefotiam per mL, of *Assay preparation 1* or *Assay preparation 2*, based on the labeled quantity in the container or in the volume of constituted solution taken, respectively, and the extent of dilution; and  $r_U$  and  $r_S$  are the cefotiam peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefoxitin Sodium

$C_{16}H_{16}N_3NaO_7S_2$  449.43

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 3-[[[(aminocarbonyl)oxy]methyl]-7-methoxy-8-oxo-7-[(2-thienylacetyl)amino]-, sodium salt (6*R*-*cis*)-.

Sodium (6*R*,7*S*)-3-(hydroxymethyl)-7-methoxy-8-oxo-7-[2-(2-thienyl)acetamido]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate carbamate (ester) [33564-30-6; 35607-66-0].

» Cefoxitin Sodium contains the equivalent of not less than 927  $\mu\text{g}$  and not more than 970  $\mu\text{g}$  of cefoxitin ( $C_{16}H_{17}N_3O_7S_2$ ) per mg, corresponding to not less than 97.5 percent and not more than 102.0 percent of cefoxitin sodium ( $C_{16}H_{16}N_3NaO_7S_2$ ), calculated on the anhydrous and acetone- and methanol-free basis.

**Packaging and storage**—Preserve in tight containers, and store in a cold place.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Cefoxitin RS

USP Endotoxin RS

**Identification**—

**A:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for cefoxitin, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

**B: Ultraviolet Absorption** (197U)—

*Solution:* 20  $\mu\text{g}$  per mL.

*Medium:* phosphate buffer (prepared by dissolving 1.0 g monobasic potassium phosphate and 1.8 g of anhydrous dibasic sodium phosphate in water to make 1000 mL).

**C:** A solution (1 in 20) responds to the tests for *Sodium* (191).

**Specific rotation** (781S): between  $+206^\circ$  and  $+214^\circ$ , calculated on the anhydrous and acetone- and methanol-free basis.

*Test solution:* 10 mg per mL, in methanol.

**Crystallinity** (695): meets the requirements.

**pH** (791): between 4.2 and 7.0, in a solution containing 100 mg per mL.

**Water, Method I** (921): not more than 1.0%, a mixture of ethylene glycol and pyridine (3:1) being used in place of methanol in the titration vessel.

**Heavy metals, Method II** (231): 0.002%.

**Limit of acetone and methanol**—

*Standard preparation*—Transfer 5.0 mL of acetone to a 1000-mL volumetric flask, dilute with water to volume, and mix (*Solution A*). Transfer 5.0 mL of methanol to a 1000-mL volumetric flask, dilute with water to volume, and mix (*Solution B*). Transfer 50.0 mL of *Solution A* and 5.0 mL of *Solution B* to a 500-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having concentrations of acetone and methanol of 0.050% and 0.005% (v/v), respectively.

*Test preparation*—Transfer 5.0 g of Cefoxitin Sodium to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 3.0 mL of the resulting solution to a 15-mL centrifuge tube, cool in an ice-water bath for 2 minutes, and add 3.0 mL of 0.24 N hydrochloric acid while swirling vigorously. Centrifuge to obtain a clear solution (*Test preparation*).

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector, and contains a 1.8-m  $\times$  6.3-mm glass column containing support S2, and a pre-column packed with 60- to 80-mesh silane-treated glass beads. The injection port is maintained at  $100^\circ$ , the columns are maintained at  $110^\circ$ , the detector is maintained at  $200^\circ$ , and nitrogen is used as the carrier gas at a flow rate of about 50 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the acetone and methanol peaks is not less than 160 and 200 theoretical plates, respectively; the tailing factors for the acetone and methanol peaks are not more than 1.3 and 2.3, respectively; and the relative standard deviation for replicate injections is not more than 5%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 2  $\mu\text{L}$ ) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the acetone and methanol peak responses. Calculate the percentages of acetone and methanol in the Cefoxitin Sodium taken by the same formula:

$$DP/C(r_U / r_S)$$

in which  $D$  is the density of acetone and methanol at  $20^\circ$  in g per mL;  $P$  is the percentage (v/v) of acetone or methanol in the *Standard preparation*;  $C$  is the concentration, in g per mL, of Cefoxitin Sodium in the *Test preparation*; and  $r_U$  and  $r_S$  are the acetone or methanol peak responses of the *Test preparation* and the *Standard preparation*, respectively: not more than 0.7% of acetone and 0.1% of methanol are found.

**Other requirements**—Where the label states that Cefoxitin Sodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Cefoxitin for Injection*. Where the label states that Cefoxitin Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Cefoxitin for Injection*.

**Assay**—

**Mobile phase**—Prepare a suitable mixture of water, acetonitrile, and glacial acetic acid (840:160:10), filter through a membrane filter (1  $\mu\text{m}$  or finer porosity), and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Phosphate buffer**—Dissolve 1.0 g of monobasic potassium phosphate and 1.8 g of dibasic sodium phosphate in 900 mL of water, adjust with phosphoric acid or 10 N sodium hydroxide to a pH of  $7.1 \pm 0.1$ , dilute with water to

make 1000 mL, and mix. Filter through a membrane filter of 1  $\mu$ m or finer porosity.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cefoxitin RS in *Phosphate buffer* to obtain a solution having a known concentration of about 0.3 mg per mL. [NOTE—Sonicate, if necessary, to dissolve the specimen.] Use this solution within 5 hours.

**Assay preparation**—Transfer about 150 mg of Cefoxitin Sodium, accurately weighed, to a 500-mL volumetric flask, dissolve in and dilute with *Phosphate buffer* to volume, and mix. Use this solution within 5 hours.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains 5- to 10- $\mu$ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the analyte peak is not less than 2800 theoretical plates, the tailing factor for the analyte peak is not more than 1.5, and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in  $\mu$ g, of cefoxitin ( $C_{16}H_{17}N_3O_7S_2$ ) per mg of the Cefoxitin Sodium taken by the formula:

$$500(CP / W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cefoxitin RS in the *Standard preparation*; P is the potency, in  $\mu$ g per mg, of USP Cefoxitin RS; W is the quantity, in mg, of Cefoxitin Sodium taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefoxitin Injection

» Cefoxitin Injection is a sterile solution of Cefoxitin Sodium and one or more suitable buffer substances in Water for Injection. It contains Dextrose or Sodium Chloride as a tonicity-adjusting agent. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cefoxitin ( $C_{16}H_{17}N_3O_7S_2$ ).

**Packaging and storage**—Preserve in *Containers for Injections* as described under *Injections* <1>. Maintain in the frozen state.

**Labeling**—It meets the requirements for *Labeling* under *Injections* <1>. The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

**USP Reference standards** <11>—

USP Cefoxitin RS  
USP Endotoxin RS

**Identification**—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for cefoxitin, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

**Bacterial endotoxins** <85>—It contains not more than 0.13 USP Endotoxin Unit per mg of cefoxitin.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** <791>: between 4.5 and 8.0.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Assay**—

*Mobile phase*, *Phosphate buffer*, *Standard preparation*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Cefoxitin Sodium*.

**Assay preparation**—Allow 1 container of Injection to thaw, and mix. Dilute an accurately measured volume of Injection quantitatively with *Phosphate buffer* to obtain a solution containing about 0.3 mg of cefoxitin per mL. Use this solution within 5 hours.

**Procedure**—Proceed as directed in the *Assay* under *Cefoxitin Sodium*. Calculate the quantity, in mg, of cefoxitin ( $C_{16}H_{17}N_3O_7S_2$ ) in each mL of the Injection taken by the formula:

$$(CP / 1000)(L / D)(r_U / r_S)$$

in which L is the labeled quantity, in mg, of cefoxitin ( $C_{16}H_{17}N_3O_7S_2$ ) in each mL of Injection taken; D is the concentration, in mg per mL, of the *Assay preparation*, based on the volume of Injection taken and the extent of dilution; and the other terms are as defined therein.

## Cefoxitin for Injection

» Cefoxitin for Injection contains Cefoxitin Sodium equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cefoxitin ( $C_{16}H_{17}N_3O_7S_2$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* <1>.

**USP Reference standards** <11>—

USP Cefoxitin RS  
USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

**Bacterial endotoxins** <85>—It contains not more than 0.13 USP Endotoxin Unit per mg of cefoxitin.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Other requirements**—It responds to the *Identification* tests and meets the requirements for *pH* and *Water* under *Cefoxitin Sodium*. It meets also the requirements for *Uniformity of Dosage Units* <905> and for *Labeling* under *Injections* <1>.

**Assay**—

*Mobile phase*, *Phosphate buffer*, *Standard preparation*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Cefoxitin Sodium*.

**Assay preparation 1** (where it is represented as being in a single-dose container)—Constitute Cefoxitin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with water to obtain a solution having a concentration of about 0.3 mg of cefoxitin per mL. Use this solution within 5 hours.

**Assay preparation 2** (where the label states the quantity of cefoxitin in a given volume of constituted solution)—Constitute Cefoxitin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured vol-

ume of the constituted solution quantitatively with water to obtain a solution containing about 0.3 mg of cefoxitin per mL. Use this solution within 5 hours.

**Procedure**—Proceed as directed in the Assay under *Cefoxitin Sodium*. Calculate the quantity, in mg, of cefoxitin ( $C_{16}H_{17}N_3O_7S_2$ ) in the portion of constituted solution taken by the formula:

$$0.001(CP)(L/D)(r_U/r_S)$$

in which *L* is the labeled quantity, in mg, in the portion of constituted solution taken; *D* is the concentration, in mg per mL, of Assay preparation 1 or Assay preparation 2, based on the volume of constituted solution taken and the extent of dilution; and the other terms are as defined therein.

## Cefpiramide

$C_{25}H_{24}N_8O_7S_2$  612.64

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[(4-hydroxy-6-methyl-3-pyridinyl)carbonyl]amino]-(4-hydroxyphenyl)acetyl]amino]-3-[[[(1-methyl-1*H*-tetrazol-5-yl)thio]methyl]-8-oxo-, [6*R*-[6*α*,7*β* (*R'*)]]-; (6*R*,7*R*)-7-[(*R*)-2-(4-Hydroxy-6-methylnicotinamido)-2-(*p*-hydroxyphenyl)acetamido]-3-[[[(1-methyl-1*H*-tetrazol-5-yl)thio]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid [70797-11-4].

### DEFINITION

Cefpiramide contains NLT 974 µg/mg and NMT 1026 µg/mg of  $C_{25}H_{24}N_8O_7S_2$ , calculated on the anhydrous basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### PROCEDURE

**Buffer:** 1.36 g/L of monobasic potassium phosphate in water adjusted with 1 N sodium hydroxide to a pH of  $6.8 \pm 0.1$  prior to final dilution

**Mobile phase:** Tetrahydrofuran, acetonitrile, methanol, and *Buffer* (40:40:40:880)

**System suitability solution:** 1 mg/mL of USP Cefpiramide RS in 0.01 N sodium hydroxide. Heat this solution at 95° for 10 min. Mix 1 mL of this solution with 19 mL of *Mobile phase*. This solution contains a mixture of cefpiramide and cefpiramide lactone.

**Standard solution:** 0.25 mg/mL of USP Cefpiramide RS in *Mobile phase*

**Sample solution:** 0.25 mg/mL of Cefpiramide in *Mobile phase*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.0-mm  $\times$  15- to 30-cm; 5- to 10-µm packing L7

**Flow rate:** 1.5 mL/min

**Injection size:** 20 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for cefpiramide and cefpiramide lactone are about 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 5 between cefpiramide lactone and cefpiramide, *System suitability solution*

**Tailing factor:** 0.95–1.4, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity, in µg, of cefpiramide ( $C_{25}H_{24}N_8O_7S_2$ ) in each mg of the portion of Cefpiramide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Cefpiramide RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Cefpiramide taken to prepare the *Sample solution* (mg/mL)

*P* = potency of cefpiramide in USP Cefpiramide RS (mg/mg)

*F* = conversion factor, 1000 µg/mg

**Acceptance criteria:** 974–1026 µg/mg on the anhydrous basis

### IMPURITIES

#### ORGANIC IMPURITIES

**System suitability solution, Chromatographic system, and System suitability:** Proceed as directed in the Assay.

**Buffer:** 4.08 g/L of monobasic potassium phosphate in water, adjusted with 1 N sodium hydroxide to a pH of  $7.5 \pm 0.1$  prior to final dilution

**Mobile phase:** Methanol and *Buffer* (250:750)

**Standard stock solution:** 0.15 mg/mL of sodium 5-mercapto-1-methyltetrazole and 0.25 mg/mL of USP Cefpiramide RS in *Buffer*

**Standard solution:** 3 µg/mL of sodium 5-mercapto-1-methyltetrazole and 5 µg/mL of USP Cefpiramide RS from the *Standard stock solution* in *Mobile phase*

**Sample solution:** 0.5 mg/mL of Cefpiramide in *Mobile phase*

***N*-Ethylmaleimide solution:** 40 mg/mL of *N*-ethylmaleimide in methanol

**Test preparation:** 10 mg/mL of sodium 5-mercapto-1-methyltetrazole in *N*-Ethylmaleimide solution in a stoppered centrifuge tube. Sonicate for 15 min.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the water content of sodium 5-mercapto-1-methyltetrazole by the titrimetric method (see *Water Determination* (921)), using 5.0 mL of the *Test preparation*.

Calculate the percentage of 5-mercapto-1-methyltetrazole in the portion of Cefpiramide taken:

$$\text{Result} = (r_U/r_S) \times (M_{r1}/M_{r2}) \times (C_S/C_U) \times F \times 100$$

$r_U$  = peak response of 5-mercapto-1-methyltetrazole from the *Sample solution*

$r_S$  = peak response of 5-mercapto-1-methyltetrazole from the *Standard solution*

$M_{r1}$  = molecular weight of 5-mercapto-1-methyltetrazole, 115.14

$M_{r2}$  = molecular weight of anhydrous sodium 5-mercapto-1-methyltetrazole, 138.13

- $C_S$  = concentration of sodium 5-mercapto-1-methyltetrazole, corrected for water, in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of Cefpiramide in the *Sample solution* ( $\text{mg/mL}$ )  
 $F$  = conversion factor, 0.001  $\text{mg}/\mu\text{g}$   
 Calculate the percentage of each other impurity in the portion of Cefpiramide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

- $r_U$  = peak response of each other impurity from the *Sample solution*  
 $r_S$  = peak response of cefpiramide from the *Standard solution*  
 $C_S$  = concentration of USP Cefpiramide RS in the *Standard solution* ( $\mu\text{g/mL}$ )  
 $C_U$  = concentration of Cefpiramide in the *Sample solution* ( $\mu\text{g/mL}$ )  
 $P$  = potency of cefpiramide in USP Cefpiramide RS ( $\mu\text{g}/\text{mg}$ )  
**Acceptance criteria:** See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
5-Mercapto-1-methyltetrazole	0.20	0.7
Cefpiramide	1.0	—
Any other individual impurity	—	0.7
Total impurities	—	2.0

**SPECIFIC TESTS**

- **OPTICAL ROTATION, Specific Rotation (781S)**  
**Sample solution:** 10  $\text{mg/mL}$ , in dimethylformamide  
**Acceptance criteria:**  $-100^\circ$  to  $-112^\circ$
- **CRYSTALLINITY (695):** Meets the requirements
- **PH (791)**  
**Sample solution:** 5- $\text{mg/mL}$  suspension in water  
**Acceptance criteria:** 3.0–5.0
- **WATER DETERMINATION, Method I (921):** NMT 9.0%
- **PYROGEN TEST (151)**  
**Sample solution:** 50  $\text{mg/mL}$  of cefpiramide in Sterile Water for Injection  
**Test dose:** 1.0  $\text{mL/kg}$  of the *Sample solution*  
**Acceptance criteria:** Where the label states that Cefpiramide is sterile, or it must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements.
- **STERILITY TESTS (71):** Where the label states that Cefpiramide is sterile, it meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP REFERENCE STANDARDS (11)**  
 USP Cefpiramide RS

**Cefpiramide for Injection****DEFINITION**

Cefpiramide for Injection contains NLT 90.0% and NMT 120.0% of the labeled amount of cefpiramide ( $\text{C}_{25}\text{H}_{24}\text{N}_8\text{O}_7\text{S}_2$ ).

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Buffer:** 1.36  $\text{g/L}$  of monobasic potassium phosphate in water adjusted with 1 N sodium hydroxide to a pH of  $6.8 \pm 0.1$  before final dilution

**Mobile phase:** Tetrahydrofuran, acetonitrile, methanol, and *Buffer* (40:40:40:880)

**System suitability solution:** 1  $\text{mg/mL}$  of USP Cefpiramide RS in 0.01 N sodium hydroxide. Heat this solution at  $95^\circ$  for 10 min. Dilute 1  $\text{mL}$  of this solution with *Mobile phase* to 20  $\text{mL}$ . This solution contains a mixture of cefpiramide and cefpiramide lactone.

**Standard solution:** 0.25  $\text{mg/mL}$  of USP Cefpiramide RS in *Mobile phase*

**Sample solution 1** (where it is represented as being in a single-dose container): Constitute a container of Cefpiramide for Injection in a volume of water corresponding to the volume of diluent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute with *Mobile phase* to obtain a solution containing the nominal equivalent of 0.25  $\text{mg/mL}$  of cefpiramide.

**Sample solution 2** (where the label states the quantity of cefpiramide in a given volume of constituted solution): Constitute a container of Cefpiramide for Injection in a volume of water equivalent to the volume of diluent specified in the labeling. Dilute the constituted solution with water to obtain a solution nominally containing 0.25  $\text{mg/mL}$  of cefpiramide.

**Chromatographic system**

(See *Chromatography (621)*, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254  $\text{nm}$

**Column:** 4.0- $\text{mm} \times 15\text{- to }30\text{-cm}$ ; 5- to 10- $\mu\text{m}$  packing L7

**Flow rate:** 1.5  $\text{mL/min}$

**Injection size:** 20  $\mu\text{L}$

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for cefpiramide and cefpiramide lactone are 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 5 between cefpiramide lactone and cefpiramide, *System suitability solution*

**Tailing factor:** 0.95–1.4, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution 1* or *Sample solution 2*

Calculate the percentage of cefpiramide ( $\text{C}_{25}\text{H}_{24}\text{N}_8\text{O}_7\text{S}_2$ ) withdrawn from the container, or in the portion of constituted solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of the *Sample solution*  
 $r_S$  = peak response of the *Standard solution*  
 $C_S$  = concentration of USP Cefpiramide RS in the *Standard solution* ( $\text{mg/mL}$ )  
 $C_U$  = nominal concentration of cefpiramide in *Sample solution 1* or *Sample solution 2* ( $\text{mg/mL}$ )

**Acceptance criteria:** 90.0%–120.0%

**SPECIFIC TESTS**• **PYROGEN TEST** (151)

**Sample solution:** 50 mg/mL of cefpiramide from Cefpiramide for Injection in Sterile Water for Injection

**Test dose:** 1.0 mL/kg of the *Sample solution*

**Acceptance criteria:** Meets the requirements

• **STERILITY TESTS** (71): It meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.• **PH** (791)

**Sample solution:** Equivalent to 100 mg/mL of cefpiramide from Cefpiramide for Injection

**Acceptance criteria:** 6.0–8.0 in water

• **WATER DETERMINATION, Method I** (921): NMT 3.0%• **PARTICULATE MATTER IN INJECTIONS** (788): It meets the requirements for small-volume injections.**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve as described in *Injections* (1), *Containers for Sterile Solids*.• **USP REFERENCE STANDARDS** (11)

USP Cefpiramide RS

**Cefpodoxime Proxetil**

$C_{21}H_{27}N_5O_9S_2$  557.60

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-carboxylic acid, 7-[[[(2-amino-4-thiazolyl)(methoxyimino)acetyl]amino]-3-(methoxymethyl)-8-oxo-1-[[[(1-methylethoxy)carbonyl]oxy]ethyl ester, [6R-[6 $\alpha$ , 7 $\beta$ (Z)]]]-, (±)-1-Hydroxyethyl(+)-(6R,7R)-7-[2-(2-amino-4-thiazolyl)glyoxylamido]-3-methoxymethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate, 7 $^2$ -(Z)-(O-methyloxime), isopropyl carbonate (ester) [87239-81-4].

» Cefpodoxime Proxetil contains the equivalent of not less than 690  $\mu$ g and not more than 804  $\mu$ g of cefpodoxime ( $C_{15}H_{17}N_5O_6S_2$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers, at a temperature not exceeding 25°.

**USP Reference standards** (11)—

USP Cefpodoxime Proxetil RS

**Identification**—

**A:** *Infrared Absorption* (197M).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 15  $\mu$ g per mL.

*Medium:* acetonitrile.

**C:** Dissolve 1 mg of it in 4 mL of water, add 1 mL of 1 N sulfuric acid while cooling in an ice bath, add 1 mL of a freshly prepared solution of sodium nitrite (1 in 100), allow to stand for 2 minutes, then add 1 mL of ammonium sulfate solution (1 in 100). Allow to stand for 1 minute, and add 1 mL of *N*-(1-naphthyl)ethylenediamine dihydrochloride TS: a red-purple color develops.

**Specific rotation** (781S): between +35.0° and +48.0°.

*Test solution:* 10 mg per mL, in methanol.

**Water, Method I** (921): not more than 3.0%.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals, Method II** (231): 0.002%.

**Isomer ratio**—Using the chromatogram of the *Assay preparation* obtained in the *Assay*, calculate the ratio of the cefpodoxime proxetil *R*-epimer peak response to the sum of the peak responses of the cefpodoxime proxetil *S*-epimer peak and the cefpodoxime proxetil *R*-epimer peak: the ratio is between 0.5 and 0.6.

**Chromatographic purity**—

*Solution A*—Prepare filtered and degassed 0.02 M ammonium acetate.

*Solution B*—Use filtered and degassed acetonitrile.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluent*—Prepare a degassed mixture of water and acetonitrile (2:1).

*System suitability solution*—Dissolve a quantity of USP Cefpodoxime Proxetil RS in *Diluent* to obtain a solution containing about 10  $\mu$ g per mL. [NOTE—A volume of methanol not exceeding 10% of the total volume in the final solution may be used to facilitate dissolution.]

*Test solution*—Transfer about 50 mg of Cefpodoxime Proxetil, accurately weighed, to a 50-mL volumetric flask, dissolve in 5 mL of methanol, using sonication if necessary, dilute with *Diluent* to volume, and mix. This solution should be injected promptly, but may be analyzed within 24 hours when stored at 8°.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 260-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L1. The column temperature is maintained at a constant temperature of about 30°. The flow rate is about 2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	90	10	equilibration (10 minutes)
0–10	90→68	10→32	linear gradient
10–40	68	32	isocratic
40–80	68→50	32→50	linear gradient
80–85	50	50	isocratic
85–90	50→25	50→75	linear gradient
90–95	25	75	isocratic
95–100	25→90	75→10	linear gradient

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the retention time for cefpodoxime proxetil *R*-epimer is between 37 and 42 minutes; the relative retention times are about 0.9 for cefpodoxime proxetil *S*-epimer and 1.0 for cefpodoxime proxetil *R*-epimer; the resolution, *R*, between cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer is not less than 4.0; the column efficiency is not less than 19,000 theoretical plates determined from the cefpodoxime proxetil *R*-epimer peak; and the relative standard deviation for replicate injections determined from the sum of the areas of the cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer peaks is not more than 2.0%.

*Procedure*—Inject a volume (about 20  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak areas. Calculate the percentage

of each impurity in the portion of Cefpodoxime Proxetil taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak area for each impurity; and  $r_s$  is the sum of the areas of all the peaks: not more than 3.0% of any peak at a relative retention time of about 0.86 is found; not more than 1.0% for any peak at relative retention times of about 1.27, 1.39, and other individual peaks having relative retention times higher than 2.0 is found; not more than 0.5% of any other individual impurity is found; and not more than 6.0% of total impurities is found, impurity peaks of less than 0.05% being disregarded.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of 0.02 M ammonium acetate and acetonitrile (6:4). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Diluent**—Prepare a degassed mixture of water and acetonitrile (6:4).

**Standard preparation**—Transfer about 25 mg of USP Cefpodoxime Proxetil RS, accurately weighed, to a 50-mL volumetric flask, dissolve in 5 mL of methanol, dilute with *Diluent* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, mix, and pass through a filter having a 0.45- $\mu$ m or finer porosity.

**Assay preparation**—Transfer about 50 mg of Cefpodoxime Proxetil, accurately weighed, to a 100-mL volumetric flask, dissolve in 10 mL of methanol, dilute with *Diluent* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, mix, and pass through a filter having a 0.45- $\mu$ m or finer porosity.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 235-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 2 mL per minute. The column temperature is maintained at a constant temperature of about 30°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for cefpodoxime proxetil S-epimer and 1.0 for cefpodoxime proxetil R-epimer; the resolution,  $R$ , between cefpodoxime proxetil S-epimer and cefpodoxime proxetil R-epimer is not less than 2.5; the tailing factor for cefpodoxime proxetil R-epimer is not more than 1.5; and the relative standard deviation determined from the sum of the areas of the cefpodoxime proxetil S-epimer and cefpodoxime proxetil R-epimer peaks for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity in  $\mu$ g of cefpodoxime ( $C_{15}H_{17}N_5O_6S_2$ ) in each mg of Cefpodoxime Proxetil taken by the formula:

$$2000(CP/W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cefpodoxime Proxetil RS in the *Standard preparation*; P is the designated potency, in  $\mu$ g per mg, of cefpodoxime ( $C_{15}H_{17}N_5O_6S_2$ ) in USP Cefpodoxime Proxetil RS; W is the weight, in mg, of Cefpodoxime Proxetil taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the sums of the peak responses for cefpodoxime proxetil S-epimer and cefpodoxime proxetil R-epimer obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefpodoxime Proxetil for Oral Suspension

» Cefpodoxime Proxetil for Oral Suspension contains Cefpodoxime Proxetil and one or more buffers, suspending agents, sweeteners, flavorings, and preservatives. When constituted as directed in the labeling, it contains the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cefpodoxime ( $C_{15}H_{17}N_5O_6S_2$ ).

**Packaging and storage**—Preserve in tight containers, at a temperature not exceeding 30°. Store the constituted Oral Suspension in a refrigerator.

**USP Reference standards** <11>—  
USP Cefpodoxime Proxetil RS

**Identification**—The retention times of the cefpodoxime proxetil R-epimer peak and the cefpodoxime proxetil S-epimer peak in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Uniformity of dosage units** <905>—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** <698>: meets the requirements.

**pH** <791>: between 4.0 and 5.5, in the suspension constituted as directed in the labeling.

**Water** <921>: not more than 1.5%.

#### Assay—

**Mobile phase, Diluent, and Chromatographic system**—Prepare as directed in the *Assay* under *Cefpodoxime Proxetil*.

**Standard preparation**—Transfer about 30 mg of USP Cefpodoxime Proxetil RS, accurately weighed, to a 50-mL volumetric flask, dissolve in 5 mL of methanol, dilute with *Diluent* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pass through a filter having a 0.45- $\mu$ m or finer porosity.

**Assay preparation**—Constitute a container of Cefpodoxime Proxetil for Oral Suspension as directed in the labeling. Shake the resulting suspension thoroughly, and determine its density. Transfer an accurately weighed quantity of the suspension, equivalent to about 50 mg of cefpodoxime, to a 100-mL volumetric flask. Add 10 mL of water, and shake to disperse. Add 20 mL of acetonitrile, and sonicate for 15 minutes. Cool to room temperature, dilute with *Diluent* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, mix, and pass through a filter having a 0.45- $\mu$ m or finer porosity.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg of cefpodoxime ( $C_{15}H_{17}N_5O_6S_2$ ) in the portion of Oral Suspension taken by the formula:

$$2CP(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cefpodoxime Proxetil RS in the *Standard preparation*; P is the designated potency, in  $\mu$ g per mg, of cefpodoxime ( $C_{15}H_{17}N_5O_6S_2$ ) in USP Cefpodoxime Proxetil RS; and  $r_U$  and  $r_S$  are the sums of the peak responses for cefpodoxime proxetil S-epimer and cefpodoxime proxetil R-epimer obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefpodoxime Proxetil Tablets

» Cefpodoxime Proxetil Tablets contain an amount of Cefpodoxime Proxetil equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cefpodoxime ( $C_{15}H_{17}N_5O_6S_2$ ).

**Packaging and storage**—Preserve in tight containers, at controlled room temperature.

**USP Reference standards** (11)—

USP Cefpodoxime Proxetil RS

**Identification**—The retention times of the cefpodoxime proxetil *R*-epimer peak and the cefpodoxime proxetil *S*-epimer peak in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

**Medium**—Dissolve 54.5 g of glycine and 42.6 g of sodium chloride in about 500 mL of water in a 1000-mL volumetric flask. Cautiously add, with swirling, 14.2 mL of hydrochloric acid, and allow to cool. Dilute with water to volume, and mix. Transfer 50 mL of this stock solution to a flask, and dilute with water to 900 mL to obtain a solution having a pH of  $3.0 \pm 0.1$ . [NOTE—If necessary, adjust the pH of the stock solution with 10 N sodium hydroxide so that when 50 mL is diluted with water to 900 mL the pH of the *Dissolution Medium* is  $3.0 \pm 0.1$ .]

**Apparatus 2**: 75 rpm.

**Time**: 30 minutes.

**Procedure**—Determine the amount of cefpodoxime ( $C_{15}H_{17}N_5O_6S_2$ ) dissolved by employing UV absorption at about 259 nm on filtered portions of the solution under test in comparison with a *Standard solution* having a known concentration of USP Cefpodoxime Proxetil RS prepared by dissolving an accurately weighed portion in a small volume of methanol and diluting quantitatively with *Dissolution Medium*.

**Tolerances**—Not less than 70% (*Q*) of the labeled amount of cefpodoxime ( $C_{15}H_{17}N_5O_6S_2$ ) is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water** (921): not more than 5.0%.

**Assay**—

**Mobile phase, Diluent, and Chromatographic system**—Prepare as directed in the *Assay* under *Cefpodoxime Proxetil*.

**Standard preparation**—Transfer about 30 mg of USP Cefpodoxime Proxetil RS, accurately weighed, to a 50-mL volumetric flask, dissolve in 5 mL of methanol, dilute with *Diluent* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Pass through a filter having a 0.45- $\mu$ m or finer porosity.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of cefpodoxime to a 100-mL volumetric flask. Dissolve in 40 mL of *Diluent*, sonicate for 5 minutes. Cool to room temperature, dilute with *Diluent* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, mix, and pass through a filter having a 0.45- $\mu$ m or finer porosity.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg of cefpodoxime ( $C_{15}H_{17}N_5O_6S_2$ ) in the portion of Tablets taken by the formula:

$$2CP(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Cefpodoxime Proxetil RS in the *Standard preparation*; *P* is the designated potency, in  $\mu$ g per mg, of cefpodoxime ( $C_{15}H_{17}N_5O_6S_2$ ) in USP Cefpodoxime Proxetil RS; and  $r_U$  and  $r_S$  are the sums of the peak responses for cefpodoxime proxetil *S*-epimer and cefpodoxime proxetil *R*-epimer obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefprozil

$C_{18}H_{19}N_3O_5S \cdot H_2O$  407.44

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[amino(4-hydroxyphenyl)acetyl]amino]-8-oxo-3-(1-propenyl)-, monohydrate, [6*R*-(6 $\alpha$ ,7 $\beta$ (*R*<sup>\*</sup>))- (6*R*,7*R*)-7-[(*R*)-2-Amino-2-(*p*-hydroxyphenyl)acetamido]-8-oxo-3-propenyl-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monohydrate [121123-17-9]. Anhydrous 389.43 [92665-29-7].

» Cefprozil contains not less than 900  $\mu$ g and not more than 1050  $\mu$ g of cefprozil ( $C_{18}H_{19}N_3O_5S$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cefprozil (*Z*)-Isomer RS

USP Cefprozil (*E*)-Isomer RS

**Identification**—

**A: Infrared Absorption** (197K)—

**Standard specimen**: USP Cefprozil (*Z*)-Isomer RS.

**B**: The retention times of the cefprozil (*Z*)-isomer and cefprozil (*E*)-isomer peaks in the chromatogram of the *Assay preparation* correspond to those of the *Standard preparations*, as obtained in the *Assay*.

**Crystallinity** (695): meets the requirements.

**pH** (791): between 3.5 and 6.5, in a solution containing 5 mg per mL.

**Water, Method I** (921): not less than 3.5% and not more than 6.5%.

**Cefprozil (*E*)-isomer ratio**—Calculate the ratio of the cefprozil (*E*)-isomer to the total cefprozil taken by the formula:

$$E / (E + Z)$$

in which *E* is the content of cefprozil (*E*)-isomer, in  $\mu$ g per mg, as determined in the *Assay*, and *Z* is the content of cefprozil (*Z*)-isomer, in  $\mu$ g per mg, as determined in the *Assay*; the ratio is between 0.06 and 0.11.

**Assay**—

**Mobile phase**—Dissolve 20.7 g of monobasic ammonium phosphate in 1800 mL of water, and adjust, if necessary, with phosphoric acid to a pH of 4.4. Add 200 mL of acetonitrile, and mix. Filter this solution through a filter having a porosity of 0.5  $\mu$ m or finer, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621). [NOTE—Decreasing the proportion of acetonitrile in-

creases retention times and improves the separation of the cefprozil isomer peaks.]

**Standard cefprozil (Z)-isomer preparation**—Dissolve an accurately weighed quantity of USP Cefprozil (Z)-Isomer RS. quantitatively in water to obtain a solution having a known concentration of about 0.25 mg per mL. [NOTE—Use this solution within 6 hours.]

**Standard cefprozil (E)-isomer preparation**—Dissolve an accurately weighed quantity of USP Cefprozil (E)-Isomer RS. quantitatively in water to obtain a stock solution having a known concentration of about 0.25 mg per mL. Transfer 5.0 mL of this stock solution to a 50-mL volumetric flask, dilute with water to volume, and mix. [NOTE—Use this solution within 6 hours.]

**Resolution solution**—Prepare a mixture of equal volumes of the Cefprozil (Z)-isomer standard preparation and of the stock solution used to prepare the Cefprozil (E)-isomer standard preparation. [NOTE—Use this solution within 6 hours.]

**Assay preparation**—Transfer about 15 mg of Cefprozil, accurately weighed, to a 50-mL volumetric flask, dilute with water to volume, and shake to assure dissolution. [NOTE—Use this solution within 6 hours.]

**Chromatographic system** (see Chromatography <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1 mL per minute. Chromatograph the Resolution solution, and record the responses as directed under Procedure: the relative retention times are about 0.7 for cefprozil (Z)-isomer and 1.0 for cefprozil (E)-isomer, and the resolution,  $R$ , between the cefprozil (Z)-isomer peak and the cefprozil (E)-isomer peak is not less than 2.5. Chromatograph the Cefprozil (Z)-isomer standard preparation, and record the responses as directed under Procedure: the column efficiency, determined from the cefprozil (Z)-isomer peak, is not less than 2500 theoretical plates when calculated by the formula:

$$5.545(t_r / W_{h/2})^2$$

the tailing factor, determined from the cefprozil (Z)-isomer peak, is not less than 0.9 and not more than 1.1, when calculated by the formula:

$$W_{0.1} / 2f$$

in which  $W_{0.1}$  is the width of the peak at 10% height, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the Cefprozil (Z)-isomer standard preparation, the Cefprozil (E)-isomer standard preparation, and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in μg, of cefprozil (Z)-isomer and cefprozil (E)-isomer in each mg of the Cefprozil taken by the formula:

$$50(CP / M)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Cefprozil (Z)-Isomer RS in the Cefprozil (Z)-isomer standard preparation or of the USP Cefprozil (E)-Isomer RS in the Cefprozil (E)-isomer standard preparation, as appropriate;  $P$  is the assigned potency, in μg per mg, of the appropriate USP Reference Standard;  $M$  is the quantity, in mg, of Cefprozil taken to prepare the Assay preparation; and  $r_U$  and  $r_S$  are the peak responses of the cefprozil (Z)-isomer or the cefprozil (E)-isomer, as appropriate, obtained from the Assay preparation and the relevant Standard preparation, respectively. Calculate the quantity, in μg, of cefprozil ( $C_{18}H_{19}N_3O_5S$ ) in each mg of the Cefprozil taken by adding the values, in μg per mg, obtained for the cefprozil (Z)-isomer and for cefprozil (E)-isomer.

## Cefprozil for Oral Suspension

### DEFINITION

Cefprozil for Oral Suspension is a dry mixture of Cefprozil and one or more suitable buffers, flavors, preservatives, suspending agents, and sweeteners. It contains NLT 90.0% and NMT 120.0% of the labeled amount of cefprozil ( $C_{18}H_{19}N_3O_5S$ ).

### IDENTIFICATION

#### • A. THIN-LAYER CHROMATOGRAPHY

**Diluent:** Acetone and 0.1 N hydrochloric acid (4:1)

**Standard solution:** 5 mg/mL of USP Cefprozil (Z)-Isomer RS in Diluent

**Sample solution:** Nominally 5 mg/mL of cefprozil in Diluent from Cefprozil for Oral Suspension. Shake for 5 min, and allow to settle. Use the supernatant.

#### Chromatographic system

(See Chromatography <621>, Thin-Layer Chromatography.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 10 μL

**Developing solvent system:** Butyl alcohol, glacial acetic acid, and water (60:20:20)

#### Analysis

**Samples:** Standard solution and Sample solution

Allow the spots to dry, and develop the chromatogram in an equilibrated chamber with the Developing solvent system until the solvent front has moved three-fourths of the length of the plate. Remove the plate, and allow it to air-dry in a hood. Place the dry plate in a chamber containing iodine vapors. Examine the plate, and locate the spots.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the Sample solution corresponds to that of the Standard solution.

- **B.** The retention times of the cefprozil (Z)-isomer and cefprozil (E)-isomer peaks of the Sample solution correspond to those of Standard solution 1 and Standard solution 2, respectively, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Buffer:** 11.5 g/L of monobasic ammonium phosphate in water. Adjust, if necessary, with phosphoric acid to a pH of 4.4.

**Mobile phase:** Acetonitrile and Buffer (100:900).

[NOTE—Decreasing the proportion of acetonitrile increases retention times and improves the resolution between the cefprozil isomer peaks.]

**Standard solution 1:** 0.25 mg/mL of USP Cefprozil (Z)-Isomer RS. Use this solution within 6 h.

**Standard stock solution:** 0.25 mg/mL of USP Cefprozil (E)-Isomer RS

**Standard solution 2:** 0.025 mg/mL of USP Cefprozil (E)-Isomer RS in water from the Standard stock solution. Use this solution within 6 h.

**System suitability solution:** A mixture of equal volumes of Standard solution 1 and the Standard stock solution. Use this solution within 6 h.

**Sample stock solution:** Nominally 1 mg/mL of cefprozil in water from Cefprozil for Oral Suspension. Prepare as follows. Constitute one container of Cefprozil for Oral Suspension as directed in the labeling. Transfer a suitable aliquot, freshly mixed and free from air bubbles, to a volumetric flask, dilute with water to volume, and mix, sonicating briefly.

**Sample solution:** Nominally 0.3 mg/mL of cefprozil in water from the Sample stock solution. Pass a portion of this solution through a filter of 0.5-μm or finer pore size. Use this solution within 6 h.

#### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 3.9-mm × 25-cm; 5-μm packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10 μL

#### System suitability

**Samples:** *Standard solution 1* and *System suitability solution*

[NOTE—The relative retention times for the cefprozil (Z)-isomer and the cefprozil (E)-isomer are about 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.5 between cefprozil (Z)-isomer and cefprozil (E)-isomer, *System suitability solution*

**Column efficiency:** NLT 2500 theoretical plates, cefprozil (Z)-isomer, *Standard solution 1*  
Calculate as follows:

$$\text{Result} = (t_R/W_{h/2})^2 \times 5.545$$

$t_R$  = retention time of cefprozil (Z)-isomer

$W_{h/2}$  = peak width at half-height

**Tailing factor:** 0.9–1.1, cefprozil (Z)-isomer, *Standard solution 1*

Calculate as follows:

$$\text{Result} = W_{0.1}/2f$$

$W_{0.1}$  = width of the peak at 10% height

$f$  = distance from the peak maximum to the leading edge of the peak measured at 10% of the peak height

**Relative standard deviation:** NMT 2.0%, *Standard solution 1*

#### Analysis

**Samples:** *Standard solution 1*, *Standard solution 2*, and *Sample solution*

Calculate the concentration, in mg/mL, of the cefprozil (Z)-isomer in the *Sample solution*:

$$\text{Result} = (r_U/r_S) \times C_S \times P \times F$$

$r_U$  = peak response of the cefprozil (Z)-isomer from the *Sample solution*

$r_S$  = peak response of the cefprozil (Z)-isomer from *Standard solution 1*

$C_S$  = concentration of USP Cefprozil (Z)-Isomer RS in *Standard solution 1* (mg/mL)

$P$  = potency of the cefprozil (Z)-isomer in USP Cefprozil (Z)-Isomer RS (μg/mg)

$F$  = correction factor, 0.001 mg/μg

Calculate the concentration, in mg/mL, of the cefprozil (E)-isomer in the *Sample solution*:

$$\text{Result} = (r_U/r_S) \times C_S \times P \times F$$

$r_U$  = peak response of the cefprozil (E)-isomer from the *Sample solution*

$r_S$  = peak response of the cefprozil (E)-isomer from *Standard solution 2*

$C_S$  = concentration of USP Cefprozil (E)-Isomer RS in *Standard solution 2* (mg/mL)

$P$  = potency of the cefprozil (E)-isomer in USP Cefprozil (E)-Isomer RS (μg/mg)

$F$  = correction factor, 0.001 mg/μg

Calculate the percentage of the labeled amount of cefprozil (C<sub>18</sub>H<sub>19</sub>N<sub>3</sub>O<sub>5</sub>S) in the portion of Cefprozil for Oral Suspension taken:

$$\text{Result} = [(C_Z + C_E)/C_U] \times 100$$

$C_Z$  = concentration of the cefprozil (Z)-isomer in the *Sample solution* (mg/mL)

$C_E$  = concentration of the cefprozil (E)-isomer in the *Sample solution* (mg/mL)

$C_U$  = nominal concentration of cefprozil in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90%–120.0%

#### PERFORMANCE TESTS

##### • UNIFORMITY OF DOSAGE UNITS (905)

For solids packaged in single-unit containers: Meets the requirements

##### • DELIVERABLE VOLUME (698)

For solids packaged in multiple-unit containers: Meets the requirements

#### SPECIFIC TESTS

##### • PH (791)

**Sample solution:** Constitute Cefprozil for Oral Suspension as directed in the labeling.

**Acceptance criteria:** 4.0–6.0

##### • WATER DETERMINATION, Method I (921): NMT 3.0%

#### ADDITIONAL REQUIREMENTS

##### • PACKAGING AND STORAGE: Preserve in tight containers.

##### • USP REFERENCE STANDARDS (11)

USP Cefprozil (E)-Isomer RS

USP Cefprozil (Z)-Isomer RS

## Cefprozil Tablets

#### DEFINITION

Cefprozil Tablets contain NLT 90.0% and NMT 120.0% of the labeled amount of cefprozil (C<sub>18</sub>H<sub>19</sub>N<sub>3</sub>O<sub>5</sub>S).

#### IDENTIFICATION

##### • A. THIN-LAYER CHROMATOGRAPHY

**Diluent:** Acetone and 0.1 N hydrochloric acid (4:1)

**Standard solution:** 5 mg/mL of USP Cefprozil (Z)-Isomer RS in *Diluent*

**Sample solution:** Nominally 2.5 mg/mL of cefprozil from 1 Tablet in *Diluent*. Shake for 5 min, and allow the mixture to settle. Use the supernatant.

##### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 10 μL

**Developing solvent system:** Butyl alcohol, glacial acetic acid, and water (60:20:20)

##### Analysis

**Samples:** *Standard solution* and *Sample solution*

Allow the spots to dry, and develop the chromatogram in an equilibrated chamber with the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate, and allow it to air-dry in a hood. Place the dry plate in a chamber containing iodine vapors. Examine the plate, and locate the spots.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

##### • B. The retention times of the cefprozil (Z)-isomer and cefprozil (E)-isomer peaks of the *Sample solution* correspond to those of *Standard solution 1* and *Standard solution 2*, respectively, as obtained in the Assay.

#### ASSAY

##### • PROCEDURE

**Buffer:** 11.5 g/L of monobasic ammonium phosphate in water. Adjust, if necessary, with phosphoric acid to a pH of 4.4.

**Mobile phase:** Acetonitrile and *Buffer* (100:900).

[NOTE—Decreasing the proportion of acetonitrile increases retention times and improves the resolution between the cefprozil isomer peaks.]

**Standard solution 1:** 0.25 mg/mL of USP Cefprozil (Z)-Isomer RS. Use this solution within 6 h.

**Standard stock solution:** 0.25 mg/mL of USP Cefprozil (E)-Isomer RS

**Standard solution 2:** 0.025 mg/mL of USP Cefprozil (E)-Isomer RS in water from the *Standard stock solution*. Use this solution within 6 h.

**System suitability solution:** A mixture of equal volumes of *Standard solution 1* and the *Standard stock solution*. Use this solution within 6 h.

**Sample stock solution:** Nominally 6 mg/mL of cefprozil in water from Tablets, prepared as follows. Transfer a suitable number of Tablets to a volumetric flask containing water. Allow the Tablets to disintegrate with the aid of swirling and sonication. Dilute with water to volume.

**Sample solution:** Nominally 0.3 mg/mL of cefprozil in water from the *Sample stock solution*. Pass a portion of this solution through a filter of 0.5- $\mu$ m or finer pore size. Use this solution within 6 h.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 3.9-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 10  $\mu$ L

#### System suitability

**Samples:** *Standard solution 1* and *System suitability solution*

[NOTE—The relative retention times for cefprozil (Z)-isomer and cefprozil (E)-isomer are about 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.5 between cefprozil (Z)-isomer and cefprozil (E)-isomer, *System suitability solution*

**Column efficiency:** NLT 2500 theoretical plates, cefprozil (Z)-isomer, *Standard solution 1*

Calculate as follows:

$$\text{Result} = (t_R/W_{h/2})^2 \times 5.545$$

$t_R$  = retention time of cefprozil (Z)-isomer

$W_{h/2}$  = peak width at half-height

**Tailing factor:** 0.9–1.1, cefprozil (Z)-isomer, *Standard solution 1*

Calculate as follows:

$$\text{Result} = W_{0.1}/2f$$

$W_{0.1}$  = width of the peak at 10% height

$f$  = distance from the peak maximum to the leading edge of the peak measured at 10% of the peak height

**Relative standard deviation:** NMT 2.0%, *Standard solution 1*

#### Analysis

**Samples:** *Standard solution 1*, *Standard solution 2*, and *Sample solution*

Calculate the concentration, in mg/mL, of the cefprozil (Z)-isomer in the *Sample solution*:

$$\text{Result} = (r_U/r_S) \times C_S \times P \times F$$

$r_U$  = peak response of the cefprozil (Z)-isomer from the *Sample solution*

$r_S$  = peak response of the cefprozil (Z)-isomer from *Standard solution 1*

$C_S$  = concentration of USP Cefprozil (Z)-Isomer RS in *Standard solution 1* (mg/mL)

$P$  = potency of the cefprozil (Z)-isomer in USP Cefprozil (Z)-Isomer RS ( $\mu$ g/mg)

$F$  = correction factor, 0.001 mg/ $\mu$ g

Calculate the concentration, in mg/mL, of the cefprozil (E)-isomer in the *Sample solution*:

$$\text{Result} = (r_U/r_S) \times C_S \times P \times F$$

$r_U$  = peak response of the cefprozil (E)-isomer from the *Sample solution*

$r_S$  = peak response of the cefprozil (E)-isomer from *Standard solution 2*

$C_S$  = concentration of USP Cefprozil (E)-Isomer RS in *Standard solution 2* (mg/mL)

$P$  = potency of the cefprozil (E)-isomer in USP Cefprozil (E)-Isomer RS ( $\mu$ g/mg)

$F$  = correction factor, 0.001 mg/ $\mu$ g

Calculate the percentage of the labeled amount of cefprozil ( $C_{18}H_{19}N_3O_5S$ ) in the portion of Tablets taken:

$$\text{Result} = [(C_Z + C_E)/C_U] \times 100$$

$C_Z$  = concentration of the cefprozil (Z)-isomer in the *Sample solution* (mg/mL)

$C_E$  = concentration of the cefprozil (E)-isomer in the *Sample solution* (mg/mL)

$C_U$  = nominal concentration of cefprozil in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–120.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

**Medium:** Water; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Mobile phase, Standard solution 1, Standard solution 2, System suitability solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Sample solution:** Pass the solution under test through a suitable filter. Dilute, if necessary, to 0.3 mg/mL of cefprozil.

#### Analysis

**Samples:** *Standard solution 1*, *Standard solution 2*, and *Sample solution*

Calculate the quantity, in mg, of cefprozil (Z)-isomer dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times D \times V \times P \times F$$

$r_U$  = peak response of cefprozil (Z)-isomer from the *Sample solution*

$r_S$  = peak response of cefprozil (Z)-isomer from *Standard solution 1*

$C_S$  = concentration of USP Cefprozil (Z)-Isomer RS in *Standard solution 1* (mg/mL)

$D$  = dilution factor of the *Sample solution*

$V$  = volume of *Medium*, 900 mL

$P$  = potency of the cefprozil (Z)-isomer in USP Cefprozil (Z)-Isomer RS ( $\mu$ g/mg)

$F$  = correction factor, 0.001 mg/ $\mu$ g

Calculate the quantity, in mg, of cefprozil (E)-isomer dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times D \times V \times P \times F$$

$r_U$  = peak response of cefprozil (E)-isomer from the *Sample solution*

$r_S$  = peak response of cefprozil (E)-isomer from *Standard solution 2*

$C_S$  = concentration of USP Cefprozil (E)-Isomer RS in *Standard solution 2* (mg/mL)

$D$  = dilution factor of the *Sample solution*

$V$  = volume of *Medium*, 900 mL

$P$  = potency of the cefprozil (E)-isomer in USP Cefprozil (E)-Isomer RS ( $\mu$ g/mg)

$F$  = correction factor, 0.001 mg/ $\mu$ g

Calculate the percentage of cefprozil ( $C_{18}H_{19}N_3O_5S$ ) dissolved:

$$\text{Result} = (M_Z + M_E) \times 100/L$$

$M_Z$  = quantity of cefprozil (Z)-isomer dissolved (mg)  
 $M_E$  = quantity of cefprozil (E)-isomer dissolved (mg)  
 $L$  = label claim of cefprozil (mg/Tablet)

**Tolerances:** NLT 75% (Q) of the labeled amount of cefprozil ( $C_{18}H_{19}N_3O_5S$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921):** NMT 7.0%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**  
 USP Cefprozil (E)-Isomer RS  
 USP Cefprozil (Z)-Isomer RS

## Ceftazidime

$C_{22}H_{22}N_6O_7S_2 \cdot 5H_2O$  636.65

Pyridinium, 1-[[7-[[[(2-amino-4-thiazolyl)[(1-carboxy-1-methylethoxy)imino]acetyl]amino]-2-carboxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-en-3-yl]methyl]-hydroxide, inner salt, pentahydrate, [6R[6 $\alpha$ ,7 $\beta$ (Z)]]-1-[[[(6R,7R)-7-[2-(2-Amino-4-thiazolyl)glyoxylamido]-2-carboxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-en-3-yl]methyl]pyridinium hydroxide, inner salt, 7 $^2$ -(Z)-[O(1-carboxy-1-methylethyl)oxime], pentahydrate [78439-06-2].

Anhydrous 546.59

» Ceftazidime contains not less than 95.0 percent and not more than 102.0 percent of  $C_{22}H_{22}N_6O_7S_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable or other sterile dosage forms.

#### USP Reference standards (11)—

USP Ceftazidime Delta-3-Isomer RS  
 USP Ceftazidime Pentahydrate RS  
 USP Endotoxin RS

**Identification**—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for ceftazidime, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Crystallinity (695):** meets the requirements.

**Sterility (71)**—Where the label states that it is sterile, it meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, except to use *Fluid A* to each 1000 mL of which has been added 10 g of sodium bicarbonate before sterilization.

**pH (791):** between 3.0 and 4.0, in a solution containing 5 mg per mL.

**Loss on drying (731)**—Dry about 300 mg, accurately weighed, in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses between 13.0% and 15.0% of its weight.

**Other requirements**—Where the label states that Ceftazidime is sterile or that it must be subjected to further processing during the preparation of injectable or other sterile dosage forms, it meets the requirements for *Bacterial endotoxins* under *Ceftazidime for Injection*.

#### Assay—

**pH 7 Buffer**—Dissolve 42.59 g of anhydrous dibasic sodium phosphate and 27.22 g of monobasic potassium phosphate in water to make 1000 mL of solution.

**Mobile phase**—Mix 40 mL of acetonitrile and 200 mL of pH 7 Buffer, and dilute with water to obtain 2000 mL of solution. Filter, using a filter having a porosity of 1  $\mu$ m or finer, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer about 29 mg of USP Ceftazidime Pentahydrate RS, accurately weighed, to a 25-mL volumetric flask containing 2.5 mL of pH 7 Buffer, and shake until dissolved. Dilute with water to volume, and mix. [NOTE—Protect this solution from light.] Immediately prior to chromatography, transfer 5.0 mL of this stock solution to a 50-mL volumetric flask, dilute with water to volume, and mix. This solution contains about 100  $\mu$ g of ceftazidime ( $C_{22}H_{22}N_6O_7S_2$ ) per mL.

**Assay preparation**—Transfer about 115 mg of Ceftazidime, accurately weighed, to a 100-mL volumetric flask containing 10.0 mL of pH 7 Buffer, and shake until dissolved. Dilute with water to volume, and mix. [NOTE—Protect this solution from light.] Immediately prior to chromatography, transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Resolution solution**—Prepare a solution of USP Ceftazidime, Delta-3-Isomer RS in pH 7 Buffer containing about 0.1 mg per mL. Immediately prior to chromatography, mix 1 mL of this solution with 8 mL of water and 1 mL of the stock solution used to prepare the *Standard preparation*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between ceftazidime and ceftazidime, delta-3-isomer is not less than 2.0. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor for the analyte peak is not less than 0.75 and not more than 1.5, and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{22}H_{22}N_6O_7S_2$  in the portion of Ceftazidime taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of ceftazidime ( $C_{22}H_{22}N_6O_7S_2$ ) in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefotazidime Injection

» Cefotazidime Injection is a sterile isoosmotic solution of Cefotazidime in Water for Injection. It contains one or more suitable buffers and a tonicity-adjusting agent. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{22}H_{22}N_6O_7S_2$ .

**Packaging and storage**—Preserve in *Containers for Injections* as described under *Injections* (1). Maintain in the frozen state.

**Labeling**—It meets the requirements for *Labeling* under *Injections* (1). The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

**USP Reference standards** (11)—  
USP Cefotazidime Delta-3-Isomer RS  
USP Cefotazidime Pentahydrate RS  
USP Endotoxin RS

**Identification**—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for cefotazidime, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.1 USP Endotoxin Unit per mg of cefotazidime.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 5.0 and 7.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

### Assay—

*pH 7 Buffer, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Cefotazidime*.

*Assay preparation*—Allow a container of the Injection to thaw, and mix the solution. Transfer an accurately measured volume of the Injection, equivalent to about 50 mg of cefotazidime, to a 50-mL volumetric flask, dilute with *pH 7 buffer* to volume, and mix. Transfer 5.0 mL of this solution to a second 50-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Cefotazidime*. Calculate the quantity, in mg, of  $C_{22}H_{22}N_6O_7S_2$  in each mL of the Injection taken by the formula:

$$0.5(C / V)(r_U / r_S)$$

in which *C* is the concentration, in  $\mu\text{g}$  per mL, of cefotazidime ( $C_{22}H_{22}N_6O_7S_2$ ) in the *Standard preparation*; *V* is the volume, in mL, of Injection taken; and  $r_U$  and  $r_S$  are the cefotazidime peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefotazidime for Injection

» Cefotazidime for Injection is a sterile mixture of Sterile Cefotazidime and Sodium Carbonate or Arginine. It contains not less than 90.0 percent and not more than 105.0 percent of cefotazidime ( $C_{22}H_{22}N_6O_7S_2$ ) on the dried and sodium carbon-

ate- or arginine-free basis, and not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cefotazidime ( $C_{22}H_{22}N_6O_7S_2$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1), protected from light.

**USP Reference standards** (11)—  
USP L-Arginine RS  
USP Cefotazidime Delta-3-Isomer RS  
USP Cefotazidime Pentahydrate RS  
USP Endotoxin RS

### Identification—

**A:** The chromatograms of the *Assay preparations* exhibit a major peak for cefotazidime, the retention time of which corresponds to that in the chromatogram of the *Standard preparation*.

**B:** It dissolves in 1 N hydrochloric acid with effervescence, evolving a colorless gas, which when passed into *calcium hydroxide TS* produces a white precipitate immediately.

**Bacterial endotoxins** (85)—It contains not more than 0.1 USP Endotoxin Unit per mg of cefotazidime.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 5.0 and 7.5, in a solution constituted in the sealed container, taking care to relieve the pressure inside the container during constitution, containing 100 mg of cefotazidime per mL.

**Loss on drying** (731)—Dry about 300 mg, accurately weighed, in vacuum at a pressure not exceeding 5 mm of mercury at 25° for 4 hours: where it contains arginine, it loses not more than 12.5% of its weight. Where it contains sodium carbonate, it loses not more than 13.5% of its weight. Where it contains arginine, use the percentage loss obtained, *m*, to calculate, on the dried and arginine-free basis, the result from *Assay preparation 1* obtained as directed in the *Assay*. Where it contains sodium carbonate, heat the residue in vacuum at a pressure not exceeding 5 mm of mercury at 100° an additional 3 hours, and calculate the total percentage of weight loss. Use this percentage, *m*, to calculate, on the dried and sodium carbonate-free basis, the result from *Assay preparation 1* obtained as directed in the *Assay*.

**Particulate matter** (788): meets the requirements for small-volume injections.

### Sodium carbonate (where present)—

*Potassium chloride solution*—Dissolve 19.07 g of potassium chloride in water to make 1000 mL of solution.

*Standard preparation*—Dissolve a suitable quantity of sodium chloride, previously dried at 105° for 2 hours and accurately weighed, in water to obtain a solution having a known concentration of about 14  $\mu\text{g}$  per mL. Transfer 10 mL of this solution to a 100-mL volumetric flask, add 10.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix.

*Test preparation*—Use the stock solution used to prepare *Assay preparation 1* in the *Assay*, diluting it quantitatively, and stepwise if necessary, with water to obtain a solution containing about 12.5  $\mu\text{g}$  of sodium carbonate per mL. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, add 10.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix.

*Blank solution*—Transfer 10.0 mL of *Potassium chloride solution* to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Concomitantly determine the absorbances of the *Standard preparation* and the *Test preparation* at the sodium emission line of 589.0 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a sodium hollow-cath-

ode lamp and an air-acetylene flame, using the *Blank solution* as the blank. Calculate the percentage of sodium carbonate ( $\text{Na}_2\text{CO}_3$ ) in the portion of Ceftazidime for Injection taken by the formula:

$$(105.99/116.88)(0.1C/M)(A_U / A_S)$$

in which 105.99 is the molecular weight of sodium carbonate; 116.88 is twice the molecular weight of sodium chloride;  $C$  is the concentration, in  $\mu\text{g}$  per mL, of sodium chloride in the *Standard preparation*;  $M$  is the quantity, in mg, of Ceftazidime for Injection in each mL of the *Test preparation*, based on the quantity taken to prepare the stock solution and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the *Test preparation* and the *Standard preparation*, respectively. Use this percentage to calculate, on the dried and sodium carbonate-free basis, the result from *Assay preparation 1* obtained as directed in the *Assay*.

#### Limit of pyridine—

**Mobile phase**—Mix 300 mL of acetonitrile and 100 mL of 0.25 M monobasic ammonium phosphate, dilute with water to obtain 1000 mL of solution, and adjust with ammonium hydroxide to a pH of  $7.0 \pm 0.1$ . Pass this solution through a filter having a 1- $\mu\text{m}$  or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**pH 7 Buffer**—Dissolve 5.68 g of anhydrous dibasic sodium phosphate and 3.63 g of monobasic potassium phosphate in water to make 1000 mL of solution.

**Standard solution**—Transfer about 250 mg of pyridine, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, and mix. Immediately prior to chromatography, transfer 2.0 mL of this solution to a 200-mL volumetric flask, dilute with pH 7 Buffer to volume, and mix. This solution contains about 25  $\mu\text{g}$  of pyridine per mL.

**Test solution**—Transfer about 660 mg of Ceftazidime for Injection, just removed from its container and accurately weighed, to a 100-mL volumetric flask, promptly add pH 7 buffer to volume, and mix. Store this solution in a cool place, and use it within 1 hour.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu\text{m}$  packing L1. The flow rate is about 1.6 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 2.5; and the relative standard deviation for replicate injections is not more than 3%.

**Procedure**—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the responses for the pyridine peaks. Calculate the percentage of pyridine in the portion of Ceftazidime for Injection taken by the formula:

$$10(C/W)(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of pyridine in the *Standard solution*;  $W$  is the weight, in mg, of Ceftazidime for Injection taken; and  $r_U$  and  $r_S$  are the pyridine peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.4% of pyridine is found where it contains sodium carbonate; and not more than 0.3% where it contains arginine.

#### Content of arginine (where present)—

**Mobile phase**—Dissolve 1.15 g of monobasic ammonium phosphate in about 800 mL of water. Adjust with phosphoric acid to a pH of  $2.0 \pm 0.1$ , dilute with water to 1000 mL, and mix. Prepare a filtered and degassed mixture of acetonitrile and this solution (750:250). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve accurately weighed quantities of USP Ceftazidime Pentahydrate RS and USP L-Arginine RS in water to obtain a solution containing known concentrations of about 0.2 mg of each per mL.

**Test preparation**—Quantitatively dissolve an accurately weighed portion of Ceftazidime for Injection in water to obtain a solution having a concentration of about 0.2 mg of ceftazidime per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 206-nm detector, a 4.6-mm  $\times$  50-cm saturator pre-column containing packing L27, and a 4-mm  $\times$  25-cm analytical column containing packing L20. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the resolution,  $R$ , between the ceftazidime and the arginine peaks is not less than 6.0; and the tailing factor for the arginine peak is not more than 4.0.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of arginine ( $\text{C}_6\text{H}_{14}\text{N}_4\text{O}_2$ ) in the Ceftazidime for Injection taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP L-Arginine RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of Ceftazidime for Injection in the *Test preparation*, based on the weight, in mg, of Ceftazidime for Injection taken and the extent of dilution; and  $r_U$  and  $r_S$  are the arginine peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively. Use this percentage to calculate, on the anhydrous and arginine-free basis, the assay result from *Assay preparation 1* obtained as directed in the *Assay*.

**Other requirements**—It meets the requirements for *Uniformity of Dosage Units* (905) and for *Labeling* under *Injections* (1).

#### Assay—

**pH 7 buffer, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system**—Proceed as directed in the *Assay* under *Ceftazidime*.

**Assay preparation 1**—Transfer an accurately weighed quantity of Ceftazidime for Injection, equivalent to about 250 mg of ceftazidime ( $\text{C}_{22}\text{H}_{22}\text{N}_6\text{O}_7\text{S}_2$ ), to a 250-mL volumetric flask, dilute with water to volume, and mix to obtain a stock solution. [NOTE—Protect this solution from light.] Immediately prior to chromatography, transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Assay preparation 2** (where it is represented as being in a single-dose container)—Constitute a container of Ceftazidime for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with water to obtain a solution containing about 1 mg of ceftazidime ( $\text{C}_{22}\text{H}_{22}\text{N}_6\text{O}_7\text{S}_2$ ) per mL. [NOTE—Protect this solution from light.] Immediately prior to chromatography, transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Assay preparation 3** (where the label states the quantity of ceftazidime in a given volume of constituted solution)—Constitute a container of Ceftazidime for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with water to obtain a solution containing about 1 mg of ceftazidime ( $\text{C}_{22}\text{H}_{22}\text{N}_6\text{O}_7\text{S}_2$ ) per mL. [NOTE—Protect this solution from light.] Immediately prior to chromatography,

transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Ceftazidime*. Calculate the percentage of ceftazidime ( $C_{22}H_{22}N_6O_7S_2$ ) on the dried and sodium carbonate-free or arginine-free basis in the portion of Ceftazidime for Injection taken by the formula:

$$250,000[C/W(100 - m - s)](r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of ceftazidime ( $C_{22}H_{22}N_6O_7S_2$ ) in the *Standard preparation*;  $W$  is the quantity, in mg, of Ceftazidime for Injection taken to prepare *Assay preparation 1*;  $m$  is the total percentage of loss on drying;  $s$  is the percentage of sodium carbonate or arginine in the Ceftazidime for Injection taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of ceftazidime ( $C_{22}H_{22}N_6O_7S_2$ ) withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$(L/D)(C)(r_U / r_S)$$

in which  $L$  is the labeled quantity, in mg, of ceftazidime ( $C_{22}H_{22}N_6O_7S_2$ ) in the container, or in the volume of constituted solution taken; and  $D$  is the concentration, in  $\mu\text{g}$ , of ceftazidime ( $C_{22}H_{22}N_6O_7S_2$ ) per mL, of *Assay preparation 2* or *Assay preparation 3*, based on the labeled quantity in the container or in the portion of constituted solution taken, respectively, and the extent of dilution.

## Ceftizoxime Sodium

$C_{13}H_{12}N_5NaO_5S_2$  405.38

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[(2,3-dihydro-2-imino-4-thiazolyl)(methoxyimino)acetyl]amino]-8-oxomonosodium salt, [6R-[6 $\alpha$ ,7 $\beta$ (Z)]]-

Sodium (6R,7R)-7-[2-(2-imino-4-thiazolin-4-yl)glyoxylamido]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate 7 $^2$ -(Z)-(O-methyloxime) [68401-82-1].

» Ceftizoxime Sodium contains the equivalent of not less than 850  $\mu\text{g}$  and not more than 995  $\mu\text{g}$  of ceftizoxime ( $C_{13}H_{13}N_5O_5S_2$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** {11}—

USP Ceftizoxime RS

USP Endotoxin RS

**Identification**—

**A:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for ceftizoxime, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

**B:** It responds to the tests for *Sodium* {191}.

**Crystallinity** {695}: meets the requirements.

**pH** {791}: between 6.0 and 8.0, in a solution (1 in 10).

**Water, Method I** {921}: not more than 8.5%.

**Other requirements**—Where the label states that Ceftizoxime Sodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Ceftizoxime for Injection*. Where the label states that Ceftizoxime Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Ceftizoxime for Injection*.

**Assay**—

**pH 3.6 Buffer**—Dissolve 1.42 g of citric acid monohydrate and 1.73 g of dibasic sodium phosphate in water to obtain 1000 mL of solution.

**pH 7.0 Buffer**—Dissolve 3.63 g of monobasic potassium phosphate and 10.73 g of dibasic sodium phosphate in water to obtain 1000 mL of solution.

**Mobile phase**—Prepare a mixture of *pH 3.6 Buffer* and acetonitrile (about 9:1). Filter through a filter (1  $\mu\text{m}$  or finer porosity), and degas. Adjust the composition, if necessary, to meet the performance requirements under *Chromatographic system*.

**Internal standard solution**—Dissolve 1.2 g of salicylic acid in 10 mL of methanol, and dilute with *pH 7.0 Buffer* to obtain 200 mL of solution.

**Standard preparation**—Dissolve a suitable quantity of USP Ceftizoxime RS, accurately weighed, in *pH 7.0 Buffer* to obtain a solution having a known concentration of about 1 mg of ceftizoxime ( $C_{13}H_{13}N_5O_5S_2$ ) per mL. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *pH 7.0 Buffer* to volume, and mix. This *Standard preparation* contains about 0.02 mg of ceftizoxime per mL.

**Assay preparation**—Using a suitable quantity of Ceftizoxime Sodium, accurately weighed, proceed as directed under *Standard preparation*.

**Chromatographic system** (see *Chromatography* {621})—The liquid chromatograph is equipped with a 254-nm detector and a 4.0-mm  $\times$  30-cm column that contains 5- to 10- $\mu\text{m}$  packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the analyte peak is not less than 2000 theoretical plates; the tailing factor for the analyte peak is not more than 2, the resolution;  $R$ , between the analyte and internal standard peaks is not less than 4; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for ceftizoxime and 1.0 for salicylic acid. Calculate the quantity, in  $\mu\text{g}$ , of ceftizoxime per mg of the Ceftizoxime Sodium taken by the formula:

$$1000(C / M)(R_U / R_S)$$

in which  $C$  is the concentration, in mg of ceftizoxime ( $C_{13}H_{13}N_5O_5S_2$ ) per mL, of the *Standard preparation*;  $M$  is the concentration, in mg per mL, of the *Assay preparation* based on the weight of Ceftizoxime Sodium taken and the extent of dilution; and  $R_U$  and  $R_S$  are the peak response ratios of the ceftizoxime peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefprozime Injection

» Cefprozime Injection is a sterile solution of Cefprozime Sodium in a diluent containing one or more tonicity-adjusting agents in Water for Injection. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of cefprozime ( $C_{13}H_{13}N_5O_5S_2$ ).

**Packaging and storage**—Preserve in *Containers for Injections* as described under *Injections* (1). Maintain in the frozen state.

**Labeling**—It meets the requirements for *Labeling* under *Injections* (1). The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

**USP Reference standards** (11)—

USP Cefprozime RS

USP Endotoxin RS

**Identification**—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for cefprozime, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.10 USP Endotoxin Unit per mg of cefprozime.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 5.5 and 8.0.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Assay**—

*pH 3.6 Buffer, pH 7.0 Buffer, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Cefprozime Sodium*.

*Assay preparation*—Allow 1 container of Injection to thaw, and mix. Transfer an accurately measured volume of the Injection, equivalent to about 40 mg of cefprozime, to a 100-mL volumetric flask, dilute with *pH 7.0 Buffer* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *pH 7.0 Buffer* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Cefprozime Sodium*. Calculate the quantity, in mg, of cefprozime ( $C_{13}H_{13}N_5O_5S_2$ ) in each mL of the Injection taken by the formula:

$$2000(C / V)(R_U / R_S)$$

in which *V* is the volume, in mL, of Injection taken, and the other terms are as defined therein.

## Cefprozime for Injection

» Cefprozime for Injection contains an amount of Cefprozime Sodium equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of cefprozime ( $C_{13}H_{13}N_5O_5S_2$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Cefprozime RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Labeling* under *Injections* (1).

**Bacterial endotoxins** (85)—It contains not more than 0.10 USP Endotoxin Unit per mg of cefprozime.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It responds to the *Identification* tests and meets the requirements for *Crystallinity, pH, and Water* under *Cefprozime Sodium*. It meets also the requirements for *Uniformity of Dosage Units* (905) and for *Labeling* under *Injections* (1).

**Assay**—

*pH 3.6 Buffer, pH 7.0 Buffer, Mobile phase, Internal standard solution, and Chromatographic system*—Prepare as directed in the *Assay* under *Cefprozime Sodium*.

*Standard preparation*—Dissolve a suitable quantity of USP Cefprozime RS, accurately weighed, in *pH 7.0 Buffer* to obtain a solution having a known concentration of about 1 mg of cefprozime ( $C_{13}H_{13}N_5O_5S_2$ ) per mL. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *pH 7.0 Buffer* to volume, and mix. This *Standard preparation* contains about 0.02 mg of cefprozime per mL.

*Assay preparation 1* (where it is represented as being in a single-dose container)—Constitute Cefprozime for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with *pH 7.0 Buffer* to obtain a solution containing about 1 mg of cefprozime per mL. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *pH 7.0 Buffer* to volume, and mix.

*Assay preparation 2* (where the label states the quantity of cefprozime in a given volume of constituted solution)—Constitute Cefprozime for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with *pH 7.0 Buffer* to obtain a solution containing about 1 mg of cefprozime per mL. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *pH 7.0 Buffer* to volume, and mix.

*Procedure*—Proceed with Cefprozime for Injection as directed for *Procedure* in the *Assay* under *Cefprozime Sodium*. Calculate the quantity, in mg, of cefprozime ( $C_{13}H_{13}N_5O_5S_2$ ) withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$(L / D)(C)(R_U / R_S)$$

in which *L* is the labeled quantity, in mg of cefprozime ( $C_{13}H_{13}N_5O_5S_2$ ), in the container, or in the volume of constituted solution taken, and *D* is the concentration, in mg of cefprozime ( $C_{13}H_{13}N_5O_5S_2$ ) per mL, of *Assay preparation 1* or *Assay preparation 2*, based on the labeled quantity in the container or in the portion of constituted solution taken, respectively; and the extent of dilution, *C* is the concentration, in mg of cefprozime ( $C_{13}H_{13}N_5O_5S_2$ ) per mL, of the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios of the cefprozime peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ceftriaxone Sodium

$C_{18}H_{16}N_8Na_2O_7S_3 \cdot 3\frac{1}{2}H_2O$  661.60

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[[[(2-amino-4-thiazolyl)(methoxyimino)acetyl]amino]-8-oxo-3-[[[(1,2,5,6-tetrahydro-2-methyl-5-, 6-dioxo-1,2,4-triazin-3-yl)thio]methyl]-, disodium salt, [6R-[6 $\alpha$ ,7 $\beta$ (Z)]]-, hydrate, (2:7).

(6R,7R)-7-[2-(2-Amino-4-thiazolyl)glyoxylamido]-8-oxo-3-[[[(1,2,5,6-tetrahydro-2-methyl-5,6-dioxo-*as*-triazin-3-yl)thio]methyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7 $\alpha$ -(Z)-(O-methyloxime), disodium salt, hemiseptahydrate [14376-79-6].

Anhydrous 598.56

» Ceftriaxone Sodium contains the equivalent of not less than 795  $\mu$ g of ceftriaxone ( $C_{18}H_{18}N_8O_7S_3$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Ceftriaxone Sodium RS

USP Ceftriaxone Sodium E-Isomer RS

USP Endotoxin RS

**Identification**—

A: *Infrared Absorption* (197K).

B: The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for ceftriaxone, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

C: It responds to the tests for *Sodium* (191).

**Crystallinity** (695): meets the requirements.

**pH** (791): between 6.0 and 8.0 in a solution (1 in 10).

**Water, Method I** (921): between 8.0% and 11.0%.

**Other requirements**—Where the label states that Ceftriaxone Sodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Ceftriaxone for Injection*. Where the label states that Ceftriaxone Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Ceftriaxone for Injection*.

**Assay**—

**pH 7.0 Buffer**—Dissolve 13.6 g of dibasic potassium phosphate and 4.0 g of monobasic potassium phosphate in water to obtain 1000 mL of solution. Adjust this solution with phosphoric acid or 10 N potassium hydroxide to a pH of  $7.0 \pm 0.1$ .

**pH 5.0 Buffer**—Dissolve 25.8 g of sodium citrate in 500 mL of water, adjust with citric acid solution (1 in 5) to a pH of  $5.0 \pm 0.1$ , and dilute with water to a volume of 1000 mL.

**Mobile phase**—Dissolve 3.2 g of tetraheptylammonium bromide in 400 mL of acetonitrile, add 44 mL of pH 7.0 Buffer and 4 mL of pH 5.0 Buffer, and add water to make

1000 mL. Filter through a membrane filter of 0.5  $\mu$ m or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ceftriaxone Sodium RS in *Mobile phase*, to obtain a solution having a known concentration of about 0.2 mg per mL. Use this solution promptly after preparation.

**Resolution solution**—Dissolve a suitable quantity of USP Ceftriaxone Sodium E-Isomer RS in *Standard preparation*, and dilute with *Mobile phase* to obtain a solution containing about 160  $\mu$ g of USP Ceftriaxone Sodium E-Isomer RS per mL and 160  $\mu$ g of USP Ceftriaxone Sodium RS per mL. Use this solution promptly after preparation.

**Assay preparation**—Transfer about 40 mg of Ceftriaxone Sodium, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Use this solution promptly after preparation.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 270-nm detector and a 4.0-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the resolution,  $R$ , between the ceftriaxone E-isomer and ceftriaxone peaks is not less than 3. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the analyte peak is not less than 1500 theoretical plates; the tailing factor for the analyte peak is not more than 2; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in  $\mu$ g, of ceftriaxone ( $C_{18}H_{18}N_8O_7S_3$ ) per mg of the Ceftriaxone Sodium taken by the formula:

$$200(CP / W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Ceftriaxone Sodium RS in the *Standard preparation*; P is the designated potency, in  $\mu$ g of ceftriaxone per mg, of USP Ceftriaxone Sodium RS; W is the quantity, in mg, of the Ceftriaxone Sodium taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the ceftriaxone peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ceftriaxone Injection

» Ceftriaxone Injection is a sterile solution of Ceftriaxone Sodium in a diluent containing one or more tonicity-adjusting agents in Water for Injection. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of ceftriaxone ( $C_{18}H_{18}N_8O_7S_3$ ).

**Packaging and storage**—Preserve in *Containers for Injections* as described under *Injections* (1). Maintain in the frozen state.

**Labeling**—It meets the requirements for *Labeling* under *Injections* (1). The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

**USP Reference standards** (11)—

USP Ceftriaxone Sodium RS  
USP Ceftriaxone Sodium E-Isomer RS  
USP Endotoxin RS

**Identification**—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for ceftriaxone, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.20 USP Endotoxin Unit per mg of ceftriaxone.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 6.0 and 8.0.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Assay**—

*pH 7.0 Buffer, pH 5.0 Buffer, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Prepare as directed in the *Assay* under *Ceftriaxone Sodium*.

*Assay preparation*—Allow 1 container of Injection to thaw, and mix. Transfer an accurately measured volume of the Injection, equivalent to about 40 mg of ceftriaxone, to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Use this solution promptly after preparation.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Ceftriaxone Sodium*. Calculate the quantity, in mg, of ceftriaxone ( $C_{18}H_{18}N_8O_7S_3$ ) in each mL of the Injection taken by the formula:

$$200(C / V)(r_U / r_S)$$

in which *V* is the volume, in mL, of Injection taken; and the other terms are as defined therein.

**Ceftriaxone for Injection**

» Ceftriaxone for Injection contains an amount of Ceftriaxone Sodium equivalent to not less than 776 µg of ceftriaxone ( $C_{18}H_{18}N_8O_7S_3$ ) per mg, calculated on the anhydrous basis, and the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of ceftriaxone ( $C_{18}H_{18}N_8O_7S_3$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Ceftriaxone Sodium RS  
USP Ceftriaxone Sodium E-Isomer RS  
USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Bacterial endotoxins** (85)—It contains not more than 0.20 USP Endotoxin Unit per mg of ceftriaxone.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It responds to the *Identification* tests and meets the requirements for *Crystallinity*, *pH*, and *Water* under *Ceftriaxone Sodium*. It meets also the requirements for *Uniformity of Dosage Units* (905) and for *Labeling* under *Injections* (1).

**Assay**—

*pH 7.0 Buffer, pH 5.0 Buffer, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Prepare as directed in the *Assay* under *Ceftriaxone Sodium*.

*Assay preparation 1*—Transfer about 40 mg of Ceftriaxone for Injection, accurately weighed, to a 200-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Use this solution promptly after preparation.

*Assay preparation 2* (where it is represented as being in a single-dose container)—Constitute Ceftriaxone for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with *Mobile phase* to obtain a solution containing about 180 µg of ceftriaxone per mL. Use this solution promptly after preparation.

*Assay preparation 3* (where the label states the quantity of ceftriaxone in a given volume of constituted solution)—Constitute Ceftriaxone for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with *Mobile phase* to obtain a solution containing about 180 µg of ceftriaxone per mL. Use this solution promptly after preparation.

*Procedure*—Proceed as directed in the *Assay* under *Ceftriaxone Sodium*. Calculate the quantity, in µg, of ceftriaxone ( $C_{18}H_{18}N_8O_7S_3$ ) per mg of the Ceftriaxone for Injection taken by the formula:

$$200(CP / W)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Ceftriaxone Sodium RS in the *Standard preparation*; *P* is the designated potency, in µg, of ceftriaxone per mg of USP Ceftriaxone Sodium RS; *W* is the quantity, in mg, of Ceftriaxone for Injection taken to prepare *Assay preparation 1*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the ceftriaxone peak responses obtained from *Assay preparation 1* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of ceftriaxone ( $C_{18}H_{18}N_8O_7S_3$ ) withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$(L / D)(CP)(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of ceftriaxone ( $C_{18}H_{18}N_8O_7S_3$ ) in the container, or in the volume of constituted solution taken; *D* is the concentration, in µg per mL, of ceftriaxone in *Assay preparation 2* or *Assay preparation 3*, based on the labeled quantity in the container or in the portion of constituted solution taken, respectively, and the extent of dilution; *C* is the concentration, in mg per mL, of USP Ceftriaxone Sodium RS in the *Standard preparation*; *P* is the designated potency, in µg, of ceftriaxone per mg of USP Ceftriaxone Sodium RS; and *r<sub>U</sub>* and *r<sub>S</sub>* are the ceftriaxone peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Cefuroxime Axetil**

$C_{20}H_{22}N_4O_{10}S$  510.47

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 3-[[[aminocarbonyl]oxy]methyl]-7-[[2-furanyl(methoxyimino)acetyl]amino]-8-oxo-, 1-(acetyloxy)ethyl ester, [6*R*-[6 $\alpha$ 7 $\beta$ (*Z*)]]-  
(*RS*)-1-Hydroxyethyl (6*R*,7*R*)-7-[2-(2-furyl)glyoxylamido]-3-(hydroxymethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene 2-carboxylate, 7<sup>2</sup>-(*Z*)-(O-methyloxime), 1-acetate 3-carbamate [64544-07-6].

» Cefuroxime Axetil is a mixture of the diastereoisomers of cefuroxime axetil (C<sub>20</sub>H<sub>22</sub>N<sub>4</sub>O<sub>10</sub>S). It contains the equivalent of not less than 745  $\mu$ g and not more than 875  $\mu$ g of cefuroxime (C<sub>16</sub>H<sub>16</sub>N<sub>4</sub>O<sub>8</sub>S) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate whether it is amorphous or crystalline.

**USP Reference standards** (11)—

USP Cefuroxime Axetil RS

USP Cefuroxime Axetil Delta-3 Isomers RS

**Identification**, *Infrared Absorption* (197K).

**Crystallinity** (695)—Particles that do not show birefringence or exhibit extinction positions are amorphous, and particles that show birefringence and exhibit extinction positions are crystalline.

**Water**, *Method I* (921): not more than 1.5%.

**Diastereoisomer ratio**—

0.2 *M* Monobasic ammonium phosphate, *Mobile phase*, *Internal standard solution*, *Resolution solution*, *Standard preparation*, *Assay preparation*, and *Chromatographic system*—Prepare as directed in the Assay.

**Procedure**—Proceed as directed for Procedure in the Assay. Calculate the ratio of cefuroxime axetil diastereoisomer A to the sum of the cefuroxime axetil diastereoisomers A and B taken by the formula:

$$r_A / (r_A + r_B)$$

in which  $r_A$  and  $r_B$  are the peak responses of the cefuroxime axetil diastereoisomers A and B, respectively: between 0.48 and 0.55 is obtained.

**Assay**—

0.2 *M* Monobasic ammonium phosphate—Dissolve 23.0 g of monobasic ammonium phosphate in water to obtain 1000 mL of solution.

*Mobile phase*—Prepare a suitable filtered and degassed mixture of 0.2 *M* Monobasic ammonium phosphate and methanol (620: 380). Make adjustments if necessary (see System Suitability under *Chromatography* (621)).

*Internal standard solution*—Prepare a solution of acetanilide in methanol containing 5.4 mg per mL.

*Resolution solution*—In a 50-mL volumetric flask, mix 10.0 mL of a solution of USP Cefuroxime Axetil RS in methanol containing 1.2 mg per mL, 5.0 mL of Internal standard solution, and 3.8 mL of a solution of USP Cefuroxime Axetil Delta-3 Isomers RS in methanol containing 0.16 mg per mL. Dilute with 0.2 *M* Monobasic ammonium phosphate to volume, and mix.

*Standard preparation*—Transfer about 30 mg of USP Cefuroxime Axetil RS, accurately weighed, to a 25-mL volumetric flask, dissolve in methanol, dilute with methanol to volume, and mix. Promptly transfer 10.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution* and 3.8 mL of methanol, dilute with 0.2 *M* Monobasic ammonium phosphate to volume, and mix. [NOTE—Use this *Standard preparation* promptly, or refrigerate and use on the day prepared.]

*Assay preparation*—Transfer about 30 mg of Cefuroxime Axetil to a 25-mL volumetric flask, dissolve in methanol, di-

lute with methanol to volume, and mix. Promptly transfer 10.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution* and 3.8 mL of methanol, dilute with 0.2 *M* Monobasic ammonium phosphate to volume, and mix. [NOTE—Use this *Assay preparation* promptly, or refrigerate and use on the day prepared.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm  $\times$  25-cm column containing 5- $\mu$ m packing L13. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.4 for acetanilide, 0.8 for cefuroxime axetil diastereoisomer B, 0.9 for cefuroxime axetil diastereoisomer A, and 1.0 for cefuroxime axetil delta-3 isomers; the resolution,  $R$ , between cefuroxime axetil diastereoisomer A and B is not less than 1.5; and the resolution,  $R$ , between cefuroxime axetil diastereoisomer A and cefuroxime axetil delta-3 isomers is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 3000 theoretical plates when measured using the cefuroxime axetil diastereoisomer A peak; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in  $\mu$ g, of cefuroxime (C<sub>16</sub>H<sub>16</sub>N<sub>4</sub>O<sub>8</sub>S) in each mg of Cefuroxime Axetil taken by the formula:

$$(W_S / W_U)(P_S / 100)(100 - K)(R_U / R_S)$$

in which  $W_S$  is the weight, in mg, of USP Cefuroxime Axetil RS taken to prepare the *Standard preparation*;  $W_U$  is the weight, in mg, of Cefuroxime Axetil taken to prepare the *Assay preparation*;  $P_S$  is the designated cefuroxime (C<sub>16</sub>H<sub>16</sub>N<sub>4</sub>O<sub>8</sub>S) content, in  $\mu$ g per mg, of anhydrous USP Cefuroxime Axetil RS;  $K$  is the percentage water content of USP Cefuroxime Axetil RS; and  $R_U$  and  $R_S$  are the ratios of the sum of the peak responses of the cefuroxime axetil diastereoisomers A and B to the peak response of the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefuroxime Axetil for Oral Suspension

### DEFINITION

Cefuroxime Axetil for Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of cefuroxime (C<sub>16</sub>H<sub>16</sub>N<sub>4</sub>O<sub>8</sub>S).

### IDENTIFICATION

- The retention times of the major peaks for cefuroxime axetil diastereoisomers A and B of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Buffer:** 23 mg/mL of monobasic ammonium phosphate in water

**Mobile phase:** Methanol and *Solution A* (19:31)

**System suitability stock solution A:** 1.2 mg/mL of USP Cefuroxime Axetil RS in methanol

**System suitability stock solution B:** 0.16 mg/mL of USP Cefuroxime Axetil Delta-3 Isomers RS in methanol

**System suitability solution:** Transfer 10.0 mL of *System suitability stock solution A* to a 50-mL volumetric flask. Add 5.0 mL of methanol and 3.8 mL of *System suitability stock solution B*. Dilute with *Buffer* to volume.

**Standard stock solution:** 1.2 mg/mL of USP Cefuroxime Axetil RS in methanol. [NOTE—Use this solution promptly.]

**Standard solution:** Transfer 10.0 mL of *Standard stock solution* to a 50-mL volumetric flask, add 8.8 mL of methanol, and dilute with *Buffer* to volume. [NOTE—Use this *Standard solution* promptly, or refrigerate and use on the day prepared.]

**Sample stock solution:** Equivalent to 2.5 mg/mL of cefuroxime, from constituted Oral Suspension, in methanol. Pass through a suitable filter. [NOTE—Constitute as directed on the label. To a suitable aliquot, freshly prepared and free of bubbles, add a suitable volume of methanol, shake by mechanical means for 10 min, dilute to volume with methanol, and mix.]

**Sample solution:** Transfer 5.0 mL of the filtered *Sample stock solution* to a 50-mL volumetric flask. Add 13.8 mL of methanol, and dilute with *Buffer* to volume. [NOTE—Protect the *Sample solution* from light and use promptly, or refrigerate and use on the day prepared.]

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 278 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L13

**Flow rate:** 1.5 mL/min

**Injection size:** 10 μL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for acetanilide, cefuroxime axetil diastereoisomer B, cefuroxime axetil diastereoisomer A, and cefuroxime axetil delta-3 isomers are 0.4, 0.8, 0.9, and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.5 between cefuroxime axetil diastereoisomer A and B; NLT 1.5 between cefuroxime axetil diastereoisomer A and cefuroxime axetil delta-3 isomers, *System suitability solution*

**Column efficiency:** NLT 3000 theoretical plates when measured using the cefuroxime axetil diastereoisomer A peak, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of  $C_{16}H_{16}N_4O_8S$  in the Cefuroxime Axetil for Oral Suspension taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times P \times F \times [1 - (K/100)] \times 100$$

$R_U$  = sum of the peak responses of cefuroxime axetil diastereoisomers A and B from the *Sample solution*

$R_S$  = sum of the peak responses of cefuroxime axetil diastereoisomers A and B from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cefuroxime axetil in the *Sample solution* (mg/mL)

$P$  = potency of cefuroxime in anhydrous USP Cefuroxime Axetil RS (μg/mg)

$F$  = unit conversion factor, 0.001 mg/μg

$K$  = water content of USP Cefuroxime Axetil RS (%)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

**Medium:** 0.07 M of pH 7.0 phosphate buffer (dissolve 3.7 mg/mL of monobasic sodium phosphate and 5.7 mg/mL of anhydrous dibasic sodium phosphate in water); 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Analysis:** Test 5.0 mL of constituted Cefuroxime Axetil for Oral Suspension equivalent to 125 or 250 mg of cefuroxime. Determine the amount of cefuroxime equivalent dissolved by using UV absorption at the wavelength of maximum absorbance at 280 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Cefuroxime Axetil RS in the same *Medium*.

**Tolerances:** NLT 60% (Q) of the labeled amount of  $C_{16}H_{16}N_4O_8S$  is dissolved.

##### • UNIFORMITY OF DOSAGE UNITS <905>

**For solid packaged in single-unit containers:**

Constitute Cefuroxime Axetil for Oral Suspension as directed in the labeling. Mix, and allow the container to drain into a beaker for 5 s. Withdraw and assay 5.0 mL of the Oral Suspension from the beaker, or the total amount if it is less than 5 mL. It meets the requirements.

##### • DELIVERABLE VOLUME <698>

**For solid packaged in multiple-unit containers:**

Constitute Cefuroxime Axetil for Oral Suspension as directed in the labeling. It meets the requirements.

#### SPECIFIC TESTS

• **pH <791>:** 3.5–7.0, in the solution constituted as directed in the labeling

• **WATER DETERMINATION, Method I <921>:** NMT 6.0%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS <11>**

USP Cefuroxime Axetil RS

USP Cefuroxime Axetil Delta-3 Isomers RS

## Cefuroxime Axetil Tablets

» Cefuroxime Axetil Tablets contain the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cefuroxime ( $C_{16}H_{16}N_4O_8S$ ).

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—The labeling indicates whether the Tablets contain amorphous or crystalline Cefuroxime Axetil. If Tablets contain a mixture of amorphous and crystalline Cefuroxime Axetil, label to indicate the percentage of each contained therein. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

#### USP Reference standards <11>—

USP Cefuroxime Axetil RS

USP Cefuroxime Axetil Delta-3 Isomers RS

**Identification**—The retention times of the major peaks for cefuroxime axetil diastereoisomers A and B in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

#### Dissolution <711>—

TEST 1—

**Medium:** 0.07 N hydrochloric acid; 900 mL.

**Apparatus 2:** 55 rpm.

**Times:** 15 and 45 minutes.

**Procedure**—Determine the amount of cefuroxime ( $C_{16}H_{16}N_4O_8S$ ) dissolved by employing UV absorption at the

wavelength of maximum absorbance at about 278 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Cefuroxime Axetil RS, equivalent to about 0.01 to 0.02 mg of cefuroxime ( $C_{16}H_{16}N_4O_8S$ ) per mL, in the same *Medium*.

**Tolerances**—Not less than 60% (Q) of the labeled amount of  $C_{16}H_{16}N_4O_8S$  is dissolved in 15 minutes, and not less than 75% (Q) is dissolved in 45 minutes; except that where Tablets are labeled to contain the equivalent of 500 mg of cefuroxime, not less than 50% (Q) of the labeled amount of  $C_{16}H_{16}N_4O_8S$  is dissolved in 15 minutes, and not less than 70% (Q) is dissolved in 45 minutes.

**TEST 2**—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Apparatus 2:** 100 rpm.

**Medium, Times, and Procedure**—Proceed as directed under *Test 1*.

**Tolerances**—Not less than 60% (Q) of the labeled amount of  $C_{16}H_{16}N_4O_8S$  is dissolved in 15 minutes, and not less than 75% (Q) of the labeled amount of  $C_{16}H_{16}N_4O_8S$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 6.0%.

#### Assay—

0.2 M Monobasic ammonium phosphate, Mobile phase, Internal standard solution, Resolution solution, Standard preparation, and Chromatographic system—Proceed as directed in the Assay under Cefuroxime Axetil.

**Assay preparation**—Finely powder not fewer than 10 Tablets, accurately counted. Transfer the powder, with the aid of methanol, to a volumetric flask of such capacity that when filled to volume, the solution will contain the equivalent of about 2 mg of cefuroxime ( $C_{16}H_{16}N_4O_8S$ ) per mL. Add methanol to fill the volumetric flask to about half of its capacity, and shake by mechanical means for about 10 minutes. Dilute with methanol to volume, and mix. Filter a portion of this stock mixture, and transfer 5.0 mL of the filtrate to a 50-mL volumetric flask. Add 5.0 mL of *Internal standard solution* and 8.8 mL of methanol, dilute with 0.2 M Monobasic ammonium phosphate to volume, and mix. [NOTE—Use this Assay preparation promptly, or refrigerate and use on the day prepared.]

**Procedure**—Proceed as directed in the Assay under Cefuroxime Axetil. Calculate the quantity, in mg, of cefuroxime ( $C_{16}H_{16}N_4O_8S$ ) in each Tablet taken by the formula:

$$(V/12,500N)(P_5W_5/100)(100 - K)(R_U / R_S)$$

in which *V* is the volume, in mL, of the volumetric flask used to prepare the stock mixture; *N* is the number of Tablets taken; and the other terms are as defined therein.

## Cefuroxime Sodium

$C_{16}H_{15}N_4NaO_8S$  446.37

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 3-[[[(aminocarbonyl)oxy]methyl]-7-[[2-furyl(methoxyimino)acetyl]amino]-8-oxo-, monosodium salt [6 $\alpha$ ,7 $\beta$ (Z)]-.

Sodium (6 $R$ ,7 $R$ )-7-[2-(2-furyl)glyoxylamido]-3-(hydroxymethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate, 7 $^2$ -(Z)-(O-methyloxime), carbamate (ester) [56238-63-2].

» Cefuroxime Sodium contains the equivalent of not less than 855  $\mu$ g and not more than 1000  $\mu$ g of cefuroxime ( $C_{16}H_{16}N_4O_8S$ ), calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

#### USP Reference standards (11)—

USP Cefuroxime Sodium RS

USP Endotoxin RS

#### Identification—

**A:** The chromatogram of the Assay preparation obtained as directed in the Assay exhibits a major peak for cefuroxime, the retention time of which corresponds to that exhibited in the chromatogram of the Standard preparation obtained as directed in the Assay.

**B:** It responds to the tests for Sodium (191).

**pH** (791): between 6.0 and 8.5, in a solution (1 in 10).

**Water, Method I** (921): not more than 3.5%.

**Other requirements**—Where the label states that Cefuroxime Sodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under Cefuroxime for Injection. Where the label states that Cefuroxime Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under Cefuroxime for Injection.

#### Assay—

**pH 3.4 acetate buffer**—Transfer 50 mL of 0.1 M sodium acetate to a 1000-mL volumetric flask, dilute with 0.1 N acetic acid to volume, and mix.

**Mobile phase**—Prepare a suitable mixture of pH 3.4 acetate buffer and acetonitrile (about 10:1). Filter through a membrane filter (1  $\mu$ m or finer porosity), and degas.

**Internal standard solution**—Prepare a solution of orcinol in water containing 1.5 mg per mL.

**Standard preparation**—Dissolve a suitable quantity of USP Cefuroxime Sodium RS, accurately weighed, in water to obtain a solution having a known concentration of about 1 mg of cefuroxime ( $C_{16}H_{16}N_4O_8S$ ) per mL. Immediately transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with water to volume, and mix. This Standard preparation contains about 0.05 mg of cefuroxime per mL.

**Assay preparation**—Using a suitable quantity of Cefuroxime Sodium, accurately weighed, proceed as directed in the first sentence under *Standard preparation*. Immediately transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L15. The flow rate is about 2 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed under *Procedure*: the column efficiency determined from the analyte peak is not less than 1300 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; the resolution, *R*, between the analyte and internal standard peaks is not less than 3.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the Standard preparation and the Assay preparation into

the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for cefuroxime and 1.0 for orcinol. Calculate the quantity, in  $\mu\text{g}$ , of cefuroxime per mg of the Cefuroxime Sodium taken by the formula:

$$1000(C/M)(R_U / R_S)$$

in which C is the concentration, in mg of cefuroxime ( $\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$ ) per mL, in the *Standard preparation*; M is the concentration, in mg per mL, in the *Assay preparation* based on the weight of Cefuroxime Sodium taken and the extent of dilution; and  $R_U$  and  $R_S$  are the peak response ratios of the cefuroxime peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cefuroxime Injection

» Cefuroxime Injection is a sterile isoosmotic solution of Cefuroxime Sodium in Water for Injection. It contains one or more suitable buffers and a tonicity-adjusting agent. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cefuroxime ( $\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$ ).

**Packaging and storage**—Preserve in *Containers for Injections* as described under *Injections* (1). Maintain in the frozen state.

**Labeling**—It meets the requirements for *Labeling* under *Injections* (1). The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

**USP Reference standards** (11)—

USP Cefuroxime Sodium RS

USP Endotoxin RS

**Identification**—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for cefuroxime, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

**Bacterial Endotoxins** (85)—It contains not more than 0.10 USP Endotoxin Unit per mg of cefuroxime.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 5.0 and 7.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements for *Uniformity of Dosage Units* (905).

**Assay**—

*pH 3.4 Acetate buffer, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Cefuroxime Sodium*.

*Assay preparation*—Allow a container of Injection to thaw, and mix the solution. Transfer an accurately measured volume of the Injection, equivalent to about 50 mg of cefuroxime, to a 50-mL volumetric flask, dilute with water to volume, and mix. Immediately transfer 5.0 mL of this solution to a second 100-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Cefuroxime Sodium*. Calculate the quantity, in mg, of

cefuroxime ( $\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$ ) in each mL of the Injection taken by the formula:

$$1000(C / V)(R_U / R_S)$$

in which V is the volume, in mL, of Injection taken, and the other terms are as defined therein.

## Cefuroxime for Injection

» Cefuroxime for Injection contains an amount of Cefuroxime Sodium equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cefuroxime ( $\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Cefuroxime Sodium RS

USP Endotoxin RS

**Constituted solution**—At the time of use, the constituted solution for intravenous administration prepared from Cefuroxime for Injection meets the requirements for *Constituted Solutions* under *Labeling* under *Injections* (1).

**Bacterial endotoxins** (85)—It contains not more than 0.10 USP Endotoxin Unit per mg of cefuroxime.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Uniformity of dosage units** (905): meets the requirements.

*Procedure for content uniformity*—Perform the *Assay* on individual containers using *Assay preparation 1* or *Assay preparation 2*, or both, as appropriate.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements of the tests for *Identification*, *pH*, and *Water* under *Cefuroxime Sodium*. It meets also the requirements for *Labeling* under *Injections* (1).

**Assay**—

*pH 3.4 Acetate buffer, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Cefuroxime Sodium*.

*Assay preparation 1* (where it is represented as being in a single-dose container)—Constitute Cefuroxime for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with water to obtain a solution containing about 1 mg of cefuroxime per mL. Immediately transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

*Assay preparation 2* (where the label states the quantity of cefuroxime in a given volume of constituted solution or suspension)—Constitute Cefuroxime for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution or suspension quantitatively with water to obtain a solution containing about 1 mg of cefuroxime per mL. Immediately transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Cefuroxime Sodium*. Calculate the quantity, in mg, of cefuroxime ( $\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$ ) withdrawn from the container, or

in the portion of constituted solution or suspension taken by the formula:

$$(L / D)(C / R_U / R_S)$$

in which *L* is the labeled quantity, in mg of cefuroxime ( $C_{16}H_{16}N_4O_8S$ ), in the container, or in the volume of constituted solution or suspension taken; *D* is the concentration, in mg of cefuroxime ( $C_{16}H_{16}N_4O_8S$ ) per mL, of *Assay preparation 1* or *Assay preparation 2*, based on the labeled quantity in the container or in the portion of constituted solution or suspension taken, respectively, and the extent of dilution; *C* is the concentration, in mg of cefuroxime ( $C_{16}H_{16}N_4O_8S$ ) per mL, of the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios of cefuroxime to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively. Where the test for *Uniformity of dosage units* has been performed using the *Procedure for content uniformity*, use the average of these determinations as the *Assay* value.

## Celecoxib

$C_{17}H_{14}F_3N_3O_2S$  381.4  
4-[5-(4-Methylphenyl)-3-(trifluoromethyl)-1*H*-pyrazol-1-yl]benzenesulfonamide;  
*p*-[5-*p*-Tolyl-3-(trifluoromethyl)pyrazol-1-yl]benzenesulfonamide [169590-42-5].

### DEFINITION

Celecoxib contains NLT 98.0% and NMT 102.0% of  $C_{17}H_{14}F_3N_3O_2S$ , calculated on the anhydrous basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197): [NOTE—Methods (197A), (197K), or (197M) under *Infrared Absorption* may be used.]  
[NOTE—If the spectra obtained show differences, dissolve the substance to be examined and the Reference Standard separately in isopropyl alcohol, evaporate to dryness, and record the new spectra.]
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 2.7 g/L of monobasic potassium phosphate adjusted with phosphoric acid to a pH of  $3.0 \pm 0.2$   
**Mobile phase:** Methanol, acetonitrile, and *Buffer* (3:1:6)  
**Diluent:** Methanol and water (3:1)  
**System suitability solution:** 0.5 mg/mL of USP Celecoxib RS and 2.4 µg/mL each of USP Celecoxib Related Compound A RS and USP Celecoxib Related Compound B RS in *Diluent*  
**Standard solution:** 0.5 mg/mL of USP Celecoxib RS in *Diluent*  
**Sample solution:** 0.5 mg/mL of Celecoxib in *Diluent*  
**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*.)  
**Mode:** LC  
**Detector:** UV 215 nm  
**Column:** 4.6-mm × 25-cm; 5-µm packing L11  
**Column temperature:** 60°  
**Flow rate:** 1.5 mL/min  
**Injection size:** 25 µL  
**Run time:** About 1.5 times the celecoxib peak elution  
**System suitability**  
**Samples:** *System suitability solution* and *Standard solution*

### Suitability requirements

**Resolution:** NLT 1.8 between celecoxib related compound A and celecoxib and NLT 1.8 between celecoxib and celecoxib related compound B, *System suitability solution*

**Relative standard deviation:** NMT 0.73%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{17}H_{14}F_3N_3O_2S$  in the portion of Celecoxib taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

*r<sub>U</sub>* = peak response from the *Sample solution*

*r<sub>S</sub>* = peak response from the *Standard solution*

*C<sub>S</sub>* = concentration of the *Standard solution* (mg/mL)

*C<sub>U</sub>* = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

### IMPURITIES

#### Inorganic Impurities

- HEAVY METALS:** NMT 20 ppm

**Diluent:** Acetone and water (17:3)

**Standard solution:** Dilute 1.0 mL of *Standard Lead Solution*, prepared as directed under *Heavy Metals* (231), *Special Reagents*, with *Diluent* to 20 mL.

**Sample solution:** Dissolve 0.50 g of Celecoxib in 20 mL of *Diluent*.

**Blank solution:** 20 mL of *Diluent*

#### Analysis

**Samples:** *Standard solution*, *Blank solution*, and *Sample solution*

To each solution, add 2 mL of pH 3.5 *Acetate Buffer*, prepared as directed under *Heavy Metals* (231), *Method I*. Mix, and add to each solution 1.2 mL of thioacetamide–glycerin base TS. Mix immediately, and allow to stand for 2 min. Pass the solutions through a filter of 0.45-µm pore size. Compare the spots on the filters obtained from each of the solutions.

**Acceptance criteria:** The brownish-black color of the spot resulting from the *Sample solution* is not more intense than that of the spot resulting from the *Standard solution*. The test is invalid if the *Standard solution* does not show a brownish-black color compared to the *Blank solution*.

- RESIDUE ON IGNITION** (281): NMT 0.2%, using a platinum crucible

#### Organic Impurities

##### PROCEDURE

**Buffer, Mobile phase, Diluent, System suitability solution, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 0.5 µg/mL of USP Celecoxib RS in *Diluent*

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

#### Suitability requirements

**Resolution:** NLT 1.8 between celecoxib related compound A and celecoxib and NLT 1.8 between celecoxib and celecoxib related compound B, *System suitability solution*

**Signal-to-noise ratio:** NLT 20, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Celecoxib taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

*r<sub>U</sub>* = peak response for each impurity in the *Sample solution*

- $r_s$  = peak response of celecoxib in the *Standard solution*  
 $C_s$  = concentration of celecoxib in the *Standard solution* (mg/mL)  
 $C_u$  = concentration of Celecoxib in the *Sample solution* (mg/mL)

**Acceptance criteria**

**Individual impurities:** See *Table 1*.

[NOTE— Disregard any impurity peak less than 0.05%.]

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Celecoxib related compound A <sup>a</sup>	0.9	0.4
Celecoxib	1.0	—
Celecoxib related compound B <sup>b</sup>	1.1	0.10
Individual unspecified impurity	—	0.10
Total impurities	—	0.5

<sup>a</sup> 4-[5-(3-Methylphenyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide.

<sup>b</sup> 4-[3-(4-Methylphenyl)-5-(trifluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide.

**SPECIFIC TESTS**

- WATER DETERMINATION, Method I (921):** NMT 0.5%, using a 400-mg sample

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in tight containers, protected from light and moisture. Store at room temperature.
- USP REFERENCE STANDARDS (11)**
  - USP Celecoxib RS
  - $p$ -[5- $p$ -Tolyl-3-(trifluoromethyl)pyrazol-1-yl]benzenesulfonamide.  
 $C_{17}H_{14}F_3N_3O_2S$  381.4
  - USP Celecoxib Related Compound A RS
  - 4-[5-(3-Methylphenyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide.  
 $C_{17}H_{14}F_3N_3O_2S$  381.4
  - USP Celecoxib Related Compound B RS
  - 4-[3-(4-Methylphenyl)-5-(trifluoromethyl)-1H-pyrazol-1-yl]benzenesulfonamide.  
 $C_{17}H_{14}F_3N_3O_2S$  381.4

**Oxidized Cellulose****DEFINITION**

Oxidized Cellulose contains NLT 16.0% and NMT 24.0% of carboxyl groups (COOH), calculated on the dried basis. It is sterile.

**IDENTIFICATION**

- A.**
  - Sample solution:** 200 mg in 10 mL of 0.25 N sodium hydroxide
  - Analysis 1:** Shake the *Sample solution* for 1 min. Add 10 mL of water, and shake.
  - Acceptance criteria 1:** The *Sample solution* shows no more than a slight haze and is substantially free from fibers and foreign particles.
  - Analysis 2:** Allow the resulting solution to stand for 10 min.
  - Acceptance criteria 2:** Any swollen fibers initially present are no longer visible.

**Analysis 3:** Acidify the resulting solution with 3 N hydrochloric acid.

**Acceptance criteria 3:** A flocculent white precipitate is formed.

**ASSAY****PROCEDURE**

**Solution A:** 20 mg/mL of calcium acetate

**Sample:** 500 mg, previously dried under vacuum over phosphorus pentoxide for 18 h

**Blank:** 50.0 mL of *Solution A*

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N sodium hydroxide VS

**Endpoint detection:** Visual

**Analysis:** Place the *Sample* in a 125-mL conical flask.

Add 50.0 mL of *Solution A*, swirl until the sample is completely covered, allow the mixture to stand for 30 min, then add phenolphthalein TS. Titrate the solution with *Titrant*. Perform a blank determination, and make any necessary correction. Each mL of *Titrant* is equivalent to 4.502 mg of carboxyl groups (COOH).

**Acceptance criteria:** 16.0%–24.0% on the dried basis

**IMPURITIES**

- RESIDUE ON IGNITION (281):** NMT 0.15%

**LIMIT OF NITROGEN**

**Solution A:** 40 mg/mL of boric acid

**Solution B:** Methyl red TS and bromocresol green TS (1:4)

**Sample:** 1 g, previously dried under vacuum over phosphorus pentoxide for 18 h

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.02 N sulfuric acid VS

**Endpoint detection:** Visual

**Analysis:** Place a 125-mL conical flask, containing 30 mL of *Solution A* and 6 drops of *Solution B*, beneath the condenser of the distillation apparatus so that the tip of the condenser is well below the surface of the resulting solution. To a 500-mL Kjeldahl flask, add the *Sample*, and add 1 g of Devarda's alloy, 100 mL of recently boiled water, a small lump of paraffin, and 100 mL of 1 N sodium hydroxide. Connect the Kjeldahl flask to the condenser by a suitable trap bulb. Heat the mixture in the flask until 45–50 mL of distillate has collected in the receiver. Rinse the condenser, and titrate the resulting solution with *Titrant* to a pale pink endpoint. Perform a blank determination, and make any necessary correction. Each mL of *Titrant* is equivalent to 0.2801 mg of nitrogen.

**Acceptance criteria:** NMT 0.5%

**LIMIT OF FORMALDEHYDE**

**Solution A:** Formaldehyde in water (1 in 40,000)

**Standard:** 0.50 mL of *Solution A*

**Sample:** 500 mg

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Vis

**Analytical wavelength:** 570 nm

**Blank:** Mixture of 0.5 mL of water and 10 mL of chromotropic acid TS

**Analysis:** Transfer the *Sample* to a 500-mL iodine flask. Add 250 mL of water, and allow to stand for NLT 2 h with intermittent shaking. Pipet 0.50 mL each of the supernatant from the resulting solution and the *Standard* into two separate glass-stoppered test tubes. To each test tube add 10 mL of chromotropic acid TS. Stopper the tubes loosely, and heat in a boiling water bath for 30 min. Cool, and determine the absorbance of each solution against the *Blank*.

**Acceptance criteria:** 0.5%; the absorbance of the *Sample* is NMT the *Standard*.

**SPECIFIC TESTS**• **STERILITY TESTS** (71)

**Sample:** 250 mg

**Analysis:** Proceed as directed in the chapter, adding 0.5 mL of 0.1 N sodium hydroxide to the portions of media used.

**Acceptance criteria:** Meets the requirements

• **LOSS ON DRYING** (731)

**Analysis:** Dry under vacuum over phosphorus pentoxide for 18 h.

**Acceptance criteria:** NMT 15.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve as described in *Injections* (1), *Containers for Sterile Solids*, protected from direct sunlight. Store in a cold place.
- **LABELING:** The package bears a statement to the effect that the sterility of Oxidized Cellulose cannot be guaranteed if the package bears evidence of damage, or if the package has been previously opened. Oxidized Cellulose meets the requirements for *Injections* (1), *Labeling*.

---

**Oxidized Regenerated Cellulose**

---

**DEFINITION**

Oxidized Regenerated Cellulose contains NLT 18.0% and NMT 24.0% of carboxyl groups (COOH), calculated on the dried basis. It is sterile.

**IDENTIFICATION**

- **A.**

**Sample solution:** 200 mg in 10 mL of 0.25 N sodium hydroxide

**Analysis 1:** Shake the *Sample solution* for 1 min. Add 10 mL of water, and shake.

**Acceptance criteria 1:** The *Sample solution* shows no more than a slight haze and is substantially free from fibers and foreign particles.

**Analysis 2:** Allow the resulting solution to stand for 10 min.

**Acceptance criteria 2:** Any swollen fibers initially present are no longer visible.

**Analysis 3:** Acidify the resulting solution with 3 N hydrochloric acid.

**Acceptance criteria 3:** A flocculent white precipitate is formed.

**ASSAY**• **PROCEDURE**

**Sample:** 1 g of Oxidized Regenerated Cellulose, previously dried at 90° for 2 h

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N hydrochloric acid VS

**Endpoint detection:** Visual

**Analysis:** Place the *Sample* in a 250-mL conical flask, add 10 mL of 0.5 N sodium hydroxide VS, swirl to dissolve, and add 100 mL of water. Immediately titrate with *Titrant* to a phenolphthalein endpoint. Perform a blank determination, and note the difference in volumes required. Each mL of the difference in volumes of 0.1 N hydrochloric acid consumed is equivalent to 4.50 mg of carboxyl groups (COOH).

**Acceptance criteria:** 18.0%–24.0% on the dried basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.15%
- **LIMIT OF NITROGEN**

**Solution A:** 40 mg/mL of boric acid

**Solution B:** Methyl red TS and bromocresol green TS (1:4)

**Sample:** 1 g, previously dried

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.02 N sulfuric acid VS

**Endpoint detection:** Visual

**Analysis:** Place a 125-mL conical flask, containing 30 mL of *Solution A* and 6 drops of *Solution B*, beneath the condenser of the distillation apparatus so that the tip of the condenser is well below the surface of the resulting solution. To a 500-mL Kjeldahl flask add the *Sample*, and add 1 g of Devarda's alloy, 100 mL of recently boiled water, a small lump of paraffin, and 100 mL of 1 N sodium hydroxide. Connect the Kjeldahl flask to the condenser by a suitable trap bulb. Heat the mixture in the flask until 45–50 mL of distillate has collected in the receiver. Rinse the condenser, and titrate the resulting solution with *Titrant* to a pale pink endpoint that persists for 30 s. Perform a blank determination, and make any necessary correction. Each mL of *Titrant* is equivalent to 0.2801 mg of nitrogen.

**Acceptance criteria:** NMT 0.5%

• **LIMIT OF FORMALDEHYDE**

**Solution A:** Formaldehyde in water (1 in 40,000)

**Standard:** 0.50 mL of *Solution A*

**Sample:** 500 mg

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Vis

**Analytical wavelength:** 570 nm

**Blank:** Mixture of 0.5 mL of water and 10 mL of chromotropic acid TS

**Analysis:** Transfer the *Sample* to a 500-mL iodine flask. Add 250 mL of water, and allow to stand for NLT 2 h with intermittent shaking. Pipet 0.50 mL each of the supernatant from the resulting solution and the *Standard* into two separate glass-stoppered test tubes. To each test tube add 10 mL of chromotropic acid TS. Stopper the tubes loosely, and heat in a boiling water bath for 30 min. Cool, and determine the absorbance of each solution against the *Blank*.

**Acceptance criteria:** 0.5% CH<sub>2</sub>O; the absorbance of the *Sample* is NMT the *Standard*.

**SPECIFIC TESTS**• **STERILITY TESTS** (71)

**Sample:** 250 mg

**Analysis:** Proceed as directed in the chapter, adding 0.5 mL of 0.1 N sodium hydroxide to the portions of media used.

**Acceptance criteria:** Meets the requirements

• **LOSS ON DRYING** (731)

**Sample:** 150 mg

**Analysis:** Dry at 90° for 2 h.

**Acceptance criteria:** NMT 15.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve as described in *Injections* (1), *Containers for Sterile Solids*, protected from direct sunlight. Store at controlled room temperature.
- **LABELING:** The package bears a statement to the effect that the sterility of Oxidized Regenerated Cellulose cannot be guaranteed if the package bears evidence of damage, or if the package has been previously opened. Oxidized Regenerated Cellulose meets the requirements for *Injections* (1), *Labeling*.

## Cellulose Sodium Phosphate

» Cellulose Sodium Phosphate is prepared by phosphorylation of alpha cellulose. It has an inorganic bound phosphate content of not less than 31.0 percent and not more than 36.0 percent, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**pH** (791)—Place 3 g of it in a 100-mL beaker, add 60 mL of water, and stir occasionally for 5 minutes. Filter through a sintered-glass crucible. The pH of the filtrate is between 6.0 and 9.0.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 10.0% of its weight.

**Nitrogen**, Method I (461): not more than 1.0%.

### Calcium binding capacity—

**Standard calcium solution**—Transfer about 0.33 g of dried calcium carbonate, primary standard grade, accurately weighed, to a 250-mL beaker with the aid of a few mL of water, and dilute with water to about 50 mL. Carefully and dropwise add 2 N hydrochloric acid until all of the solid dissolves, and add 2 drops in excess. Heat the solution to boiling, and boil for 5 minutes. Cool the solution, and transfer to a 1000-mL volumetric flask. Dilute with water to volume, and mix. Calculate the molarity,  $M$ , of the solution taken by the formula:

$$g / 100.09$$

in which  $g$  is the weight, in g, of calcium carbonate taken.

**Standard edetate disodium titrant**—Dissolve 10 g of edetate disodium in 100 mL of water. Slowly add alcohol until the first permanent precipitate is formed. Filter, and discard the solid. Add an equal volume of alcohol to the filtrate. Filter the resulting precipitate, discard the filtrate, and wash the residue on the filter, first with acetone, then with ethyl ether. Dry at 80° for 4 days at about 50% relative humidity. Transfer about 3.72 g of this purified edetate disodium, accurately weighed, to a 1000-mL volumetric flask, and dissolve with water. Dilute with water to volume, and mix. Calculate the molarity,  $M_s$ , of the solution taken by the formula:

$$w / 372.24$$

in which  $w$  is the weight, in g, of the purified edetate disodium taken.

**Procedure**—Transfer  $0.15 \pm 0.02$  g of Cellulose Sodium Phosphate, accurately weighed, to a 250-mL beaker. Add 150.0 mL of *Standard calcium solution*, and stir the mixture for 5 minutes on a magnetic stirrer. Filter, discarding the first few mL of the filtrate. To 50.0 mL of the filtrate add about 50 mL of water, 15 mL of 1 N sodium hydroxide, and 300 mg of hydroxy naphthol blue. Titrate with *Standard edetate disodium titrant* to a permanent deep blue color, and designate the number of mL consumed as  $V_s$ . Calculate the calcium binding capacity of the undried Cellulose Sodium Phosphate, in mmol per g, by the formula:

$$(150M - 3V_s M_s) / W$$

in which  $W$  is the weight, in g, of Cellulose Sodium Phosphate taken; and the other terms are as defined above. The calcium binding capacity, calculated on the dried basis, is not less than 1.8 mmol per g.

**Heavy metals**, Method III (231): 0.004%.

### Free phosphate—

**Standard preparation**—Prepare as directed under *Inorganic bound phosphate*.

**Test preparation**—Transfer about 2 g of Cellulose Sodium Phosphate, accurately weighed, to a 250-mL beaker. Add 100 mL of water, accurately measured, stir, allow to stand for 5 minutes, stir again, and filter through moderately retentive filter paper, collecting the filtrate in a dry flask.

**Procedure**—Transfer 2.0 mL of the *Standard preparation* and 5.0 mL of the *Test preparation* to separate 100-mL volumetric flasks. Proceed as directed in the *Procedure under Inorganic bound phosphate*, beginning with "Treat each of these." Calculate the percentage of free phosphate taken by the formula:

$$(4000 / W)(A_u / A_s)$$

in which  $W$  is the weight, in mg, of undried Cellulose Sodium Phosphate taken: not more than 3.5%, calculated on the dried basis, is found.

### Sodium content—

**Standard stock solution**—Dissolve 508.5 mg of sodium chloride, previously dried at 105° for 2 hours, in 100 mL of water, transfer to a 1000-mL volumetric flask, dilute with water to volume, and mix. Each mL of this solution contains 200 µg of sodium.

**Standard preparations**—Transfer 5.0, 10.0, 15.0, and 20.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks, dilute each with water to volume, and mix.

**Test preparation**—Dissolve about 250 mg of Cellulose Sodium Phosphate, accurately weighed, in 10 mL of a mixture of 20 mL of perchloric acid and 15 mL of nitric acid. Heat cautiously to the production of dense, white fumes, cool, transfer to a 1000-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the emission of the *Test preparation* and of each *Standard preparation* at the sodium emission line of 589 nm, with a suitable flame photometer. Plot the emissions of the *Standard preparations* versus their concentration of sodium, and draw a straight line best fitting the four plotted points. From the graph so obtained determine the concentration of sodium in the *Test preparation*. Calculate the percentage of sodium in the undried Cellulose Sodium Phosphate. The content of sodium, calculated on the dried basis, is not less than 9.5% and not more than 13.0%.

### Inorganic bound phosphate—

**Standard preparation**—Transfer 358.2 mg of monobasic potassium phosphate, primary standard grade, to a 250-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Each mL of this solution contains 1.0 mg of phosphate.

**Test preparation**—Transfer about 250 mg of Cellulose Sodium Phosphate, accurately weighed, to a 250-mL conical flask. Rinse the bottom with a few mL of water. Add 10 mL of a mixture of 20 mL of perchloric acid and 15 mL of nitric acid. Heat cautiously to the production of dense, white fumes, cool the clear, almost colorless, solution, and transfer to a 100-mL volumetric flask with the aid of water. Dilute with water to volume, and mix.

**Procedure**—Transfer 2.0-mL portions of the *Standard preparation* and the *Test preparation* to separate 100-mL volumetric flasks. Treat each of these and a third flask, providing the blank, as follows: Add 10 mL of 5 N nitric acid, 10.0 mL of ammonium vanadate TS, and about 60 mL of water. Swirl, and add 10.0 mL of a freshly prepared solution of 2.5 g of ammonium molybdate in 50 mL of warm water. Dilute with water to volume, and mix. Concomitantly determine the absorbances,  $A_u$  and  $A_s$ , of the solutions from the *Standard preparation* and the *Test preparation*, respectively, at 400 nm with a suitable spectrophotometer, using the rea-

gent blank to set the instrument. Calculate the percentage of total phosphate taken by the formula:

$$(10,000 / W)(A_U / A_S)$$

in which *W* is the weight, in mg, of Cellulose Sodium Phosphate taken. Calculate the percentage of inorganic bound phosphate in the undried Cellulose Sodium Phosphate by subtracting from this result the percentage of *Free phosphate*.

## Cellulose Sodium Phosphate for Oral Suspension

» Cellulose Sodium Phosphate for Oral Suspension contains Cellulose Sodium Phosphate. It has an inorganic bound phosphate content of not less than 28.0 percent and not more than 36.0 percent calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers. Store in a refrigerator.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 10.0% of its weight.

### Calcium binding capacity—

*Standard calcium solution* and *Standard edetate disodium titrant*—Proceed as directed for *Calcium binding capacity* under *Cellulose Sodium Phosphate*.

*Procedure*—Transfer an accurately weighed amount of Oral Suspension, equivalent to about 0.15 g of cellulose sodium phosphate, to a 250-mL beaker. Proceed as directed for *Procedure* in *Calcium binding capacity* under *Cellulose Sodium Phosphate*, beginning with “Add 150.0 mL of *Standard calcium solution*.” Calculate the calcium binding capacity, in mmol per g, of the portion of undried Cellulose Sodium Phosphate for Oral Suspension taken by the formula:

$$(150M_S - 3V_S M_S) / W$$

in which *W* is the weight, in g, of Cellulose Sodium Phosphate for Oral Suspension taken; and the other terms are as defined therein: not less than 1.8 mmol per g, calculated on the dried basis, is found.

### Free phosphate—

*Standard preparation*—Proceed as directed for *Free phosphate* under *Cellulose Sodium Phosphate*.

*Test preparation*—Transfer an accurately weighed amount of Cellulose Sodium Phosphate for Oral Suspension, equivalent to about 2 g of cellulose sodium phosphate, to a 250-mL beaker. Proceed as directed for *Free phosphate* under *Cellulose Sodium Phosphate*, beginning with “Add 100 mL of water.”

*Procedure*—Proceed as directed for *Free phosphate* under *Cellulose Sodium Phosphate*. Calculate the percentage of free phosphate in the portion of Cellulose Sodium Phosphate for Oral Suspension taken by the formula:

$$(4000 / W)(A_U / A_S)$$

in which *W* is the weight, in mg, of undried Cellulose Sodium Phosphate for Oral Suspension taken; and the other terms are as defined therein: not more than 6.0%, calculated on the dried basis, is found.

### Inorganic bound phosphate—

*Standard preparation*—Proceed as directed for *Inorganic bound phosphate* under *Cellulose Sodium Phosphate*.

*Test preparation*—Transfer an accurately weighed amount of Cellulose Sodium Phosphate for Oral Suspension, equivalent to about 250 mg of cellulose sodium phosphate, to a 250-mL conical flask. Proceed as directed for *Test preparation* in *Inorganic bound phosphate* under *Cellulose Sodium Phosphate*, beginning with “Rinse to the bottom.”

*Procedure*—Proceed as directed for *Inorganic bound phosphate* under *Cellulose Sodium Phosphate*. Calculate the percentage of total phosphate in the portion of Cellulose Sodium Phosphate for Oral Suspension taken by the formula:

$$(10,000 / W)(A_U / A_S)$$

in which *W* is the weight, in mg, of Cellulose Sodium Phosphate for Oral Suspension taken; and the other terms are as defined therein. Calculate the percentage of inorganic bound phosphate in the portion of undried Cellulose Sodium Phosphate for Oral Suspension by subtracting from this result the percentage of free phosphate.

## Cephalexin

$C_{16}H_{17}N_3O_4S \cdot H_2O$  365.40

$C_{16}H_{17}N_3O_4S$  347.40

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[(aminophenylacetyl)amino]-3-methyl-8-oxo-, monohydrate, [6*R*-[6*α*,7*β* (*R*<sup>\*</sup>)]-; (6*R*,7*R*)-7-[(*R*)-2-Amino-2-phenylacetamido]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monohydrate [23325-78-2]. Anhydrous [15686-71-2].

### DEFINITION

Cephalexin has a potency of NLT 950 µg/mg and NMT 1030 µg/mg of  $C_{16}H_{17}N_3O_4S$ , calculated on the anhydrous basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Mobile phase:** 0.985 g/L of sodium-1-pentanesulfonate in a mixture of acetonitrile, methanol, triethylamine, and water (20:10:3:170), adjusted with phosphoric acid to a pH of 3.0 ± 0.1

**Standard stock solution:** 1 mg/mL of USP Cephalexin RS in water

**Standard solution:** 0.4 mg/mL of cephalexin in *Mobile phase* from *Standard stock solution*

**Sample stock solution:** 1 mg/mL of Cephalexin in water

**Sample solution:** 0.4 mg/mL of Cephalexin in *Mobile phase* from *Sample stock solution*

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1 of low acidity

**Flow rate:** 1.5 mL/min

**Injection size:** 20 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements****Relative standard deviation:** NMT 2.0%**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the quantity, in µg, of cephalexin  
(C<sub>16</sub>H<sub>17</sub>N<sub>3</sub>O<sub>4</sub>S) per mg of the Cephalexin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Cephalexin RS in the  
*Standard solution* (mg/mL)  
 $C_U$  = concentration of Cephalexin in the *Sample*  
*solution* (mg/mL)  
 $P$  = potency of cephalexin in USP Cephalexin RS  
 (µg/mg)

**Acceptance criteria:** 950–1030 µg/mg on the anhy-  
 drous basis

**IMPURITIES****Organic Impurities****• PROCEDURE 1**

**Solution A:** Dissolve 1 g of sodium 1-pentanesulfonate  
 in a mixture of 1000 mL of water and 15 mL of trieth-  
 ylamine. Adjust with phosphoric acid to a pH of 2.5 ±  
 0.1.

**Solution B:** Dissolve 1 g of sodium 1-pentanesulfonate  
 in a mixture of 300 mL of water and 15 mL of triethyl-  
 amine. Adjust with phosphoric acid to a pH of 2.5 ±  
 0.1, and add 350 mL of acetonitrile and 350 mL of  
 methanol.

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
1	100	0
33.3	0	100
34.3	0	100

**Diluent:** 18 mg/mL of monobasic potassium phosphate  
 in water

**Standard solutions:** 0.08 mg/mL and 0.16 mg/mL of  
 cephalexin (C<sub>16</sub>H<sub>17</sub>N<sub>3</sub>O<sub>4</sub>S) from USP Cephalexin RS in  
*Diluent*, taking into account the stated potency of the  
 USP Cephalexin RS

**Sample solution:** 5 mg/mL of Cephalexin in *Diluent*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1 of low acidity

**Flow rate:** 1 mL/min

**Injection size:** 20 µL

**Analysis**

**Samples:** *Standard solutions* and *Sample solution*  
 Plot the responses of the cephalexin peaks from the  
*Standard solutions* versus their concentrations, calcu-  
 lated on the anhydrous basis, in mg/mL, and draw a  
 straight line through the two points and zero. From  
 the line and the peak responses of the *Sample solu-*  
*tion*, determine the concentration,  $I$ , in mg/mL, of  
 each cephalexin-related substance of the *Sample solu-*  
*tion* other than the cephalexin peak.

Calculate the percentage of each cephalexin-related  
 substance:

$$\text{Result} = I/C \times 100$$

$I$  = concentration of each cephalexin-related  
 substance in the *Sample solution* as  
 determined from the calibration curve  
 (mg/mL)

$C$  = concentration of cephalexin from the *Sample*  
*solution* (mg/mL)

**Acceptance criteria**

**Individual impurities:** NMT 1.0% of any individual  
 cephalexin-related substance

**Total impurities:** NMT 5.0%

- **PROCEDURE 2: DIMETHYLANILINE** <223>: Meets the  
 requirement

**SPECIFIC TESTS**

- **OPTICAL ROTATION**, *Specific Rotation* <781S>: +149° to  
 +158°

**Sample solution:** 5 mg/mL, in pH 4.4 neutralized  
 phthalate buffer (see *Reagents, Indicators, and Solu-*  
*tions—Buffer Solutions*)

- **CRYSTALLINITY** <695>: Meets the requirements
- **pH** <791>: 3.0–5.5, in an aqueous suspension containing  
 50 mg/mL
- **WATER DETERMINATION**, *Method I* <921>: 4.0%–8.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** <11>  
 USP Cephalexin RS

**Cephalexin Hydrochloride**

C<sub>16</sub>H<sub>17</sub>N<sub>3</sub>O<sub>4</sub>S · HCl · H<sub>2</sub>O 401.87  
 5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-

**Cephalexin Capsules****DEFINITION**

Cephalexin Capsules contain the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of cephalexin (C<sub>16</sub>H<sub>17</sub>N<sub>3</sub>O<sub>4</sub>S).

**IDENTIFICATION**

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Mobile phase:** 0.985 g/L of sodium 1-pentanesulfonate in a mixture of acetonitrile, methanol, triethylamine, and water (20:10:3:170), adjusted with phosphoric acid to a pH of  $3.0 \pm 0.1$

**Standard stock solution:** 1 mg/mL of USP Cephalexin RS in water

**Standard solution:** 0.4 mg/mL of cephalexin in *Mobile phase* from *Standard stock solution*

**Sample stock solution:** Equivalent to 1 mg/mL of cephalexin from combined contents of NLT 20 Capsules in water. Sonicate, if necessary, to dissolve the cephalexin. Filter, if necessary, to obtain a clear solution.

**Sample solution:** 0.4 mg/mL of cephalexin in *Mobile phase* from *Sample stock solution*

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 254 nm**Column:** 4.6-mm × 25-cm; packing L1 of low acidity**Flow rate:** 1.5 mL/min**Injection size:** 20 µL**System suitability****Sample:** *Standard solution***Suitability requirements****Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of cephalexin (C<sub>16</sub>H<sub>17</sub>N<sub>3</sub>O<sub>4</sub>S) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Cephalexin RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of cephalexin in the *Sample solution* (mg/mL)  
 $P$  = potency of cephalexin in USP Cephalexin RS (µg/mg)

F = conversion factor, 0.001 mg/μg  
**Acceptance criteria:** 90.0%–120.0%

### PERFORMANCE TESTS

- **DISSOLUTION** <711>  
**Medium:** Water; 900 mL  
**Apparatus 1:** 100 rpm  
**Time:** 30 min  
**Standard solution:** 20 μg/mL of USP Cephalexin RS in *Medium*  
**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary, to a concentration of about 20 μg/mL.  
**Spectrometric conditions**  
 (See *Spectrophotometry and Light-Scattering* <851>.)  
**Mode:** UV  
**Analytical wavelength:** 262 nm  
**Analysis**  
**Samples:** *Standard solution* and *Sample solution*  
**Tolerances:** NLT 80% (Q) of the labeled amount of cephalexin (C<sub>16</sub>H<sub>17</sub>N<sub>3</sub>O<sub>4</sub>S) is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

 USP Cephalexin RS

## Cephalexin for Oral Suspension

### DEFINITION

Cephalexin for Oral Suspension is a dry mixture of Cephalexin and one or more suitable buffers, colors, diluents, and flavors. It contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of C<sub>16</sub>H<sub>17</sub>N<sub>3</sub>O<sub>4</sub>S per mL when constituted as directed in the labeling.

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

- **PROCEDURE**  
**Mobile phase:** 0.985 g/L of sodium 1-pentanesulfonate in a mixture of acetonitrile, methanol, triethylamine, and water (20:10:3:170), adjusted with phosphoric acid to a pH of 3.0 ± 0.1  
**Standard stock solution:** 1 mg/mL of USP Cephalexin RS in water  
**Standard solution:** Mix 10.0 mL of *Standard stock solution* with 15.0 mL of *Mobile phase*.  
**Sample stock solution:** Nominally equivalent to 1 mg/mL of cephalexin from Oral Suspension, constituted as directed in the labeling, freshly mixed and free from air bubbles. Sonicate, if necessary, to assure complete dissolution of the cephalexin. Filter, if necessary, to obtain a clear solution.  
**Sample solution:** Mix 10.0 mL of *Sample stock solution* and 15.0 mL of *Mobile phase*.  
**Chromatographic system**  
 (See *Chromatography* <621>, *System Suitability*.)  
**Mode:** LC  
**Detector:** UV 254 nm  
**Column:** 4.6-mm × 25-cm; packing L1 of low acidity  
**Flow rate:** 1.5 mL/min  
**Injection size:** 20 μL  
**System suitability**  
**Sample:** *Standard solution*  
**Suitability requirements**  
**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of cephalexin (C<sub>16</sub>H<sub>17</sub>N<sub>3</sub>O<sub>4</sub>S) in each mL of the constituted Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

- $r_U$  = peak response from the *Sample solution*
  - $r_S$  = peak response from the *Standard solution*
  - $C_S$  = concentration of USP Cephalexin RS in the *Standard stock solution* (mg/mL)
  - $C_U$  = nominal concentration of cephalexin from the *Sample stock solution* (mg/mL)
  - $P$  = potency of USP Cephalexin RS (μg/mg)
  - $F$  = conversion factor, 0.001 mg/μg
- Acceptance criteria:** 90.0%–120.0%

### PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** <905> For solid packaged in single-unit containers: meets the requirements
- **DELIVERABLE VOLUME** <698>: Meets the requirements

### SPECIFIC TESTS

- **PH** <791>: 3.0–6.0, constituted as directed in the labeling

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** <11>  
 USP Cephalexin RS

## Cephalexin Tablets

### DEFINITION

Cephalexin Tablets are prepared from Cephalexin or Cephalexin Hydrochloride. They contain the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of cephalexin (C<sub>16</sub>H<sub>17</sub>N<sub>3</sub>O<sub>4</sub>S).

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

- **PROCEDURE**  
**Mobile phase:** 0.985 g/L of sodium 1-pentanesulfonate in a mixture of acetonitrile, methanol, triethylamine, and water (20:10:3:170). Adjust with phosphoric acid to a pH of 3.0 ± 0.1.  
**Standard stock solution:** 1 mg/mL of USP Cephalexin RS in water  
**Standard solution:** 0.4 mg/mL of cephalexin in *Mobile phase* from *Standard stock solution*  
**Sample stock solution:** Equivalent to 1 mg/mL of cephalexin from combined contents of powdered Tablets (NLT 20) in water. Sonicate, if necessary, to assure complete dissolution of the cephalexin. Filter, if necessary, to obtain a clear solution.  
**Sample solution:** 0.4 mg/mL of cephalexin in *Mobile phase* from *Sample stock solution*  
**Chromatographic system**  
 (See *Chromatography* <621>, *System Suitability*.)  
**Mode:** LC  
**Detector:** UV 254 nm  
**Column:** 4.6-mm × 25-cm; packing L1 of low acidity  
**Flow rate:** 1.5 mL/min  
**Injection size:** 20 μL  
**System suitability**  
**Sample:** *Standard solution*  
**Suitability requirements**  
**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of cephalexin ( $C_{16}H_{17}N_3O_4S$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Cephalexin RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of cephalexin in the *Sample solution* (mg/mL)  
 $P$  = potency of cephalexin in USP Cephalexin RS ( $\mu\text{g}/\text{mg}$ )  
 $F$  = conversion factor, 0.001 mg/ $\mu\text{g}$   
**Acceptance criteria:** 90.0%–120.0%

**PERFORMANCE TESTS**• **DISSOLUTION** <711>

**For Cephalexin**

**Medium:** Water; 900 mL

**Apparatus 1:** Use 40-mesh cloth and 100 rpm

**Time:** 30 min

**Standard solution:** 20  $\mu\text{g}/\text{mL}$  of USP Cephalexin RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute, if necessary, with *Medium* to a concentration that is similar to the *Standard solution*.

**Spectrometric conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV

**Analytical wavelength:** 262 nm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Tolerances:** NLT 80% (Q) of the labeled amount of cephalexin ( $C_{16}H_{17}N_3O_4S$ ) is dissolved.

**For Cephalexin hydrochloride**

**Medium, Standard solution, Sample solution, Spectrometric conditions, and Analysis:** Proceed as directed *For Cephalexin*.

**Apparatus 1:** Use 10-mesh cloth and 150 rpm.

**Time:** 45 min

**Tolerances:** NLT 75% (Q) of the labeled amount of cephalexin ( $C_{16}H_{17}N_3O_4S$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** The label states whether the Tablets contain Cephalexin or Cephalexin Hydrochloride.
- **USP REFERENCE STANDARDS** <11>  
USP Cephalexin RS

**Cephalexin Tablets for Oral Suspension****DEFINITION**

Cephalexin Tablets for Oral Suspension contain NLT 90.0% and NMT 110.0% of the labeled amount of cephalexin ( $C_{16}H_{17}N_3O_4S$ ).

**IDENTIFICATION**

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**• **PROCEDURE**

**Mobile phase:** 0.985 g/L of sodium 1-pentanesulfonate in a mixture of acetonitrile, methanol, triethylamine,

and water (20:10:3:170), adjusted with phosphoric acid to a pH of  $3.0 \pm 0.1$

**Standard stock solution:** 1 mg/mL of USP Cephalexin RS in water

**Standard solution:** 0.4 mg/mL of cephalexin in *Mobile phase* from *Standard stock solution*

**Sample stock solution:** Nominally equivalent to 1 mg/mL of cephalexin from combined contents of NLT 20 powdered Tablets for Oral Suspension in water. Pass a portion of the solution through a filter having a 1- $\mu\text{m}$  or finer pore size.

**Sample solution:** 0.4 mg/mL of cephalexin in *Mobile phase* from *Sample stock solution*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1 of low acidity

**Flow rate:** 1.5 mL/min

**Injection size:** 20  $\mu\text{L}$

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of cephalexin ( $C_{16}H_{17}N_3O_4S$ ) in each Tablet for Oral Suspension:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Cephalexin RS in the *Standard stock solution* (mg/mL)  
 $C_U$  = nominal concentration of cephalexin in the *Sample stock solution* (mg/mL)  
 $P$  = potency of cephalexin in USP Cephalexin RS ( $\mu\text{g}/\text{mg}$ )  
 $F$  = conversion factor, 0.001 mg/ $\mu\text{g}$   
**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **DISINTEGRATION** <701>: Tablets for Oral Suspension disintegrate in 3 min, using water at  $20 \pm 5^\circ$ .

• **DISSOLUTION** <711>

**Medium:** Water; 900 mL

**Apparatus 1:** Use 40-mesh cloth and 100 rpm.

**Time:** 30 min

**Standard solution:** 20  $\mu\text{g}/\text{mL}$  of USP Cephalexin RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary, to a concentration of about 20  $\mu\text{g}/\text{mL}$ .

**Spectrometric conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV

**Analytical wavelength:** 262 nm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Tolerances:** NLT 80% (Q) of the labeled amount of cephalexin ( $C_{16}H_{17}N_3O_4S$ ) is dissolved.

- **DISPERSION FINENESS:** Place 2 Tablets for Oral Suspension in 100 mL of water, and stir until completely dispersed. A smooth dispersion is obtained that passes through a No. 25 sieve.
- **UNIFORMITY OF DOSAGE UNITS** <905>: Meets the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers at controlled room temperature.
- **USP REFERENCE STANDARDS** <11>  
USP Cephalexin RS

## Cephalothin Sodium

$C_{16}H_{15}N_2NaO_6S_2$  418.42

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 3-[(acetyloxy)methyl]-8-oxo-7-[(2-thienylacetyl)amino]-, monosodium salt, (6*R*-*trans*)-.

Monosodium (6*R*,7*R*)-3-(hydroxymethyl)-8-oxo-7-[2-(2-thienyl)-acetamido]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate acetate (ester) [58-71-9].

» Cephalothin Sodium contains the equivalent of not less than 850 µg of cephalothin ( $C_{16}H_{16}N_2O_6S_2$ ) per mg, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Cephalothin Sodium RS

USP Endotoxin RS

**Identification**—

**A:** *Ultraviolet Absorption* (197U)—

*Solution:* 25 µg per mL.

*Medium:* water.

**B:** It responds to the tests for *Sodium* (191).

**Specific rotation** (781S): between +124° and +134°.

*Test solution:* a known amount of specimen, equivalent to about 50 mg of cephalothin, per mL, in water.

**Crystallinity** (69S): meets the requirements.

**pH** (791): between 4.5 and 7.0, in a solution containing 250 mg per mL.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours; it loses not more than 1.5% of its weight.

**Chromatographic purity**—

*Mobile phase*, *Resolution solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Standard solution*—Use the *Standard preparation*, prepared as directed in the *Assay*, transfer 1.0 mL to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Test solution*—Use the *Assay preparation* prepared as directed in the *Assay*.

*Procedure*—Proceed as directed for the *Procedure* in the *Assay*, except to inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* and to continue the chromatography of the *Test solution* for at least 4 times the retention time of the main cephalothin peak. The area of any peak in the chromatogram obtained from the *Test solution*, except the main peak, is not greater than the area of the main peak in the chromatogram obtained from the *Standard solution* (1.0%), and the sum of the areas of any such peaks is not greater than 3 times the area of the main peak in the chromatogram obtained from the *Standard solution* (3.0%). [NOTE—Any peak in the chromatogram obtained from the *Test solution* with an area less than one-tenth that of the main peak in the chromatogram obtained from the *Standard solution* is disregarded.]

**Other requirements**—Where the label states that Cephalothin Sodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Cephalothin for Injection*. Where the label states that *Cephalothin Sodium* must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Cephalothin for Injection*.

**Assay**—

*Mobile phase*—Dissolve 17 g of sodium acetate in 790 mL of water, add 0.6 mL of glacial acetic acid, and if necessary adjust with 0.1 N sodium hydroxide or glacial acetic acid to a pH of  $5.9 \pm 0.1$ . Add 150 mL of acetonitrile and 70 mL of alcohol, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Cephalothin Sodium RS quantitatively in *Mobile phase* to obtain a solution having a known concentration of about 1 mg per mL.

*Resolution solution*—Heat a 5-mL portion of the *Standard preparation* in a water bath at 90° for 10 minutes. Cool the solution, and immediately inject a portion of it into the chromatograph as directed under *Chromatographic system*.

*Assay preparation*—Transfer about 25 mg of Cephalothin Sodium, accurately weighed, to a 25-mL volumetric flask, add about 15 mL of *Mobile phase*, swirl to dissolve, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5 µm packing L1 and is maintained at a constant temperature of about 40°. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the resolution between the two principal peaks is not less than 9.0. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the tailing factor is not more than 1.8, and the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of cephalothin ( $C_{16}H_{16}N_2O_6S_2$ ) in each mg of Cephalothin Sodium taken by the formula:

$$25(CP / W)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Cephalothin Sodium RS in the *Standard preparation*; *P* is the assigned potency, in µg of cephalothin per mg, of USP Cephalothin Sodium RS; *W* is the quantity, in mg, of Cephalothin Sodium taken to prepare the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the cephalothin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cephalothin Injection

» Cephalothin Injection contains an amount of Cephalothin Sodium equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of cephalothin ( $C_{16}H_{16}N_2O_6S_2$ ).

**Packaging and storage**—Preserve in *Containers for Injections* as described under *Injections* (1). Maintain in the frozen state.

**Labeling**—It meets the requirements for *Labeling* under *Injections* (1). The label states that it is to be thawed just prior to use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

**USP Reference standards** (11)—

USP Cephalothin Sodium RS

USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 0.13 USP Endotoxin Unit per mg of cephalothin.

**pH** (791): between 6.0 and 8.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It responds to the *Identification* test A under *Cephalothin Sodium* and meets the requirements for *Sterility* under *Cephalothin for Injection*.

**Assay**—

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Cephalothin Sodium*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of cephalothin ( $C_{16}H_{16}N_2O_6S_2$ ), to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Cephalothin Sodium*. Calculate the quantity, in  $\mu\text{g}$ , of cephalothin ( $C_{16}H_{16}N_2O_6S_2$ ) in each mL of the Injection taken by the formula:

$$100(CP / V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Cephalothin Sodium RS, in the *Standard preparation*; *P* is the assigned potency, in  $\mu\text{g}$  of cephalothin ( $C_{16}H_{16}N_2O_6S_2$ ) per mg, of USP Cephalothin Sodium RS; *V* is the volume, in mL, of Injection taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the cephalothin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cephalothin for Injection

» Cephalothin for Injection contains an amount of Cephalothin Sodium equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of cephalothin ( $C_{16}H_{16}N_2O_6S_2$ ). It may contain Sodium Bicarbonate.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Cephalothin Sodium RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Specific rotation** (781S): between  $+124^\circ$  and  $+134^\circ$ , calculated on the dried and sodium bicarbonate-free basis.

*Test solution*: a known amount of specimen, equivalent to about 50 mg of cephalothin, per mL, in water.

**Bacterial endotoxins** (85)—It contains not more than 0.13 USP Endotoxin Unit per mg of cephalothin.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Uniformity of dosage units** (905): meets the requirements.

*Procedure for content uniformity*—Perform the *Assay* on individual containers using *Assay preparation 1* or *Assay preparation 2*, or both, as appropriate.

**pH** (791): between 6.0 and 8.5, in the solution constituted as directed in the labeling.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Content of sodium bicarbonate (if present)**—Dissolve about 1 g of it, accurately weighed, in 50 mL of water. Add methyl orange TS, and titrate with 0.1 N sulfuric acid VS. Each mL of 0.1 N sulfuric acid is equivalent to 8.401 mg of  $\text{NaHCO}_3$ . Calculate the percentage of sodium bicarbonate, and use the value obtained to calculate the *Specific rotation* on the dried and sodium bicarbonate-free basis.

**Other requirements**—It meets the requirements for *Identification* test A and *Loss on drying* under *Cephalothin Sodium*. It meets also the requirements for *Labeling* under *Injections* (1).

**Assay**—

*Mobile phase, Resolution solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Cephalothin Sodium*.

*Standard preparation*—Dissolve a suitable quantity of USP Cephalothin Sodium RS, accurately weighed, in *Mobile phase* to obtain a solution having a known concentration of about 1 mg of cephalothin per mL.

*Assay preparation 1* (where it is represented as being in a single-dose container)—Constitute Cephalothin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with *Mobile phase* to obtain a solution having a concentration of about 1 mg of cephalothin per mL.

*Assay preparation 2* (where the label states the quantity of cephalothin in a given volume of constituted solution)—Constitute 1 container of Cephalothin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured portion of the constituted solution quantitatively with *Mobile phase* to obtain a solution having a concentration of about 1 mg of cephalothin per mL.

*Procedure*—Proceed as directed in the *Assay* under *Cephalothin Sodium*. Calculate the quantity, in mg, of cephalothin ( $C_{16}H_{16}N_2O_6S_2$ ) in the container, and in the portion of constituted solution taken by the formula:

$$(L / D)(CP / 1000)(r_U / r_S)$$

in which *L* is the labeled quantity of cephalothin in the container, or in the volume of constituted solution taken; *D* is the concentration, in mg per mL, of cephalothin in *Assay preparation 1* or in *Assay preparation 2*, on the basis of the labeled quantity in the container, or in the portion of constituted solution taken, respectively, and the extent of dilution; and the other terms are as defined therein. Where the test for *Uniformity of dosage units* has been performed using the *Procedure for content uniformity*, use the average of these determinations as the *Assay* value.

## Cephapirin Benzathine

(C<sub>17</sub>H<sub>17</sub>N<sub>3</sub>O<sub>6</sub>S<sub>2</sub>)<sub>2</sub> · C<sub>16</sub>H<sub>20</sub>N<sub>2</sub> 1087.27

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 3-[(acetyl-oxy)methyl]-8-oxo-7-[[4-(pyridinylthio)acetyl]amino]-, (6*R*-*trans*)-, compd. with *N,N'*-bis(phenylmethyl)-1,2-ethanediamine (2:1).

(6*R*,7*R*)-3-(hydroxymethyl)-8-oxo-7-[2-(4-pyridylthio)-acetamido]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid compound with *N,N'*-dibenzylethylenediamine (2:1) [97468-37-6].

» Cephapirin Benzathine contains the equivalent of not less than 715 µg and not more than 820 µg of cephapirin (C<sub>17</sub>H<sub>17</sub>N<sub>3</sub>O<sub>6</sub>S<sub>2</sub>) per mg.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Cephapirin Benzathine RS

USP Cephapirin Sodium RS

**Identification, Infrared Absorption** (197K).

**Crystallinity** (695): meets the requirements.

**pH** (791): between 4.0 and 7.0, in a suspension (1 in 10).

**Water, Method I** (921): not more than 5.0%.

**Benzathine content**—Using about 1 g of Cephapirin Benzathine, accurately weighed, proceed as directed in the test for *Benzathine content* under *Penicillin G Benzathine*: between 20.0% and 24.0% of benzathine (C<sub>16</sub>H<sub>20</sub>N<sub>2</sub>), calculated on the anhydrous basis, is found.

**Assay**—

**Solution A**—Transfer about 26.2 mL of acetic acid and about 99.12 g of potassium acetate to a 4-L volumetric flask. Add 2000 mL of water, and mix to dissolve. Dilute with water to volume, and pass through a 0.45-µm nylon filter.

**Solution B**—Use acetonitrile.

**Mobile phase**—Use variable mixtures of **Solution A** and **Solution B** as directed for *Chromatographic system*. Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

**Extraction solution**: a mixture of 400 mL of acetic acid and 600 mL of water.

**Dilution buffer**—Dissolve about 205 g of potassium acetate in about 800 mL of water. Adjust with acetic acid to a pH of 7.5 to 8.2. Dilute with water to 1000 mL, and pass through a 0.45-µm nylon filter.

**10% Acetic acid solution**—Add about 10.0 mL of acetic acid to a 100-mL volumetric flask. Mix, and dilute with water to volume.

**System suitability solution**—Dissolve an accurately weighed quantity of USP Cephapirin Sodium RS in 10% Acetic acid solution to prepare a solution containing a known concentration of about 2.0 mg per mL. Heat the solution at 50° for 12 to 18 hours.

**Standard preparation**—In duplicate, accurately weigh about 50 mg of USP Cephapirin Sodium RS, and transfer into a 25-mL volumetric flask. Add about 2.5 mL of *Extraction solution* and about 15.0 mL of *Dilution buffer*, and agitate to dissolve. Add 7.0 mL of acetonitrile, and mix well.

Allow the solution to return to room temperature, and dilute with water to volume.

**Assay preparation**—In duplicate, weigh about 60 mg of Cephapirin Benzathine, and transfer into a 25-mL volumetric flask. Add about 2.5 mL of *Extraction solution* and 15.0 mL of *Dilution buffer*, and mix to dissolve. Add 7.0 mL of acetonitrile, and mix. Allow the flask to return to room temperature, and dilute with water to volume.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 260-nm detector, a 3.2-mm × 15-mm guard column that contains 7-µm packing L1 and a 3.9-mm × 15-cm analytical column that contains 4-µm packing L1. The flow rate is about 2.0 mL per minute, and the columns are heated to 40°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–6	91.5	8.5	isocratic
6–10	91.5→80.0	8.5→20.0	linear
10–12	80.0	20.0	isocratic
12	80.0→91.5	20.0→8.5	return to initial
12–21	91.5	8.5	re-equilibration

Chromatograph the *System suitability solution* and the *Standard preparation*, and record the peak heights and valleys as directed for *Procedure*. Using the results from the *System suitability solution*, calculate the percentage of the height of the valley taken by the formula:

$$100(r_v / r_i)$$

in which  $r_v$  is the height of the valley between cephapirin and any impurity; and  $r_i$  is the impurity peak height. The percentage of the height of the valley is not more than 25% for the impurity peaks adjacent to the cephapirin peak. [NOTE—The *System suitability solution* is acceptable as long as the cephapirin peak is larger than the two peaks on either side of the cephapirin peak.] The relative standard deviation for replicate injections of the *Standard preparation* is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 2 µL) of the duplicate *Standard preparation* and the duplicate *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in µg, of C<sub>17</sub>H<sub>17</sub>N<sub>3</sub>O<sub>6</sub>S<sub>2</sub> in each mg of Cephapirin Benzathine taken by the formula:

$$P(W_s / W_u)(V_u / V_s)(r_u / r_s)$$

in which  $P$  is the assigned potency, in µg of cephapirin per mg, of USP Cephapirin Sodium RS;  $W_s$  and  $W_u$  are the quantities of USP Cephapirin Sodium RS and Cephapirin Benzathine, in mg, used to prepare the *Standard preparation* and the *Assay preparation*, respectively;  $V_s$  and  $V_u$  are the final volumes, in mL, of the *Standard preparation* and the *Assay preparation*, respectively; and  $r_u$  and  $r_s$  are the average peak areas of the cephapirin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cephapirin Benzathine Intramammary Infusion

» Cephapirin Benzathine Intramammary Infusion is a suspension of Cephapirin Benzathine in a suitable vegetable oil vehicle. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled quantity

of cephapirin ( $C_{17}H_{17}N_3O_6S_2$ ). It contains a suitable dispersing agent.

**Packaging and storage**—Preserve in well-closed unit-dose disposable syringes at controlled room temperature.

**Labeling**—Label Intramammary Infusion to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Cephapirin Benzathine RS

USP Cephapirin Sodium RS

**Identification**, *Infrared Absorption* (197K)—Prepare the test specimen as follows. Transfer the contents of 1 syringe of Intramammary Infusion to a 50-mL centrifuge tube, add 25 mL of toluene, mix for about 1 minute, and centrifuge. Remove and discard the toluene layer without disturbing the residue in the centrifuge tube. Wash the residue with two 25-mL portions of toluene. Dry the residue in vacuum at 60°, and use the dried residue as the test specimen. Mix the dried residue with 9 parts of potassium bromide, and record the IR spectrum, using the diffuse reflectance technique: the IR absorption spectrum so obtained corresponds to that of a similar dispersion of USP Cephapirin Benzathine RS in potassium bromide.

**Water**, *Method I* (921): not more than 1.0%, 10 mL of Intramammary Infusion being tested.

**Assay**—

*Solution A, Solution B, Mobile phase, Extraction solution, Dilution buffer, 10% Acetic acid solution, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Cephapirin Benzathine.

*Assay preparation*—Express the entire contents of a syringe of the Intramammary Infusion into a centrifuge tube. For each mL of Intramammary Infusion, add 1.0 *n*-heptane and 1.5 mL of *Extraction solution*, cap, and vortex at high speed for 5 minutes. Centrifuge for 5 minutes at a sufficient speed to break the emulsion. Remove the aqueous layer, and pass through a 0.45- $\mu$ m nylon filter, discarding the first 0.5 mL. Transfer 2.5 mL of the filtered aqueous phase into a 25-mL volumetric flask that contains a solution composed of 15.0 mL of *Dilution buffer* and 7.0 mL of acetonitrile. Add water to volume, and mix well to obtain a single phase.

*Procedure*—Separately inject equal volumes (about 2  $\mu$ L) of the duplicate *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the quantity, in mg, of cephapirin ( $C_{17}H_{17}N_3O_6S_2$ ) in each syringe of Intramammary Infusion taken by the formula:

$$15PW(V_U / V_S)(r_U / r_S)$$

in which *P* is the assigned potency, in  $\mu$ g cephapirin per mg, of USP Cephapirin Sodium RS; *W* is the quantity of USP Cephapirin Sodium RS, in mg, used to prepare the *Standard preparation*; *V<sub>S</sub>* is the final volume, in mL, of the *Standard preparation*; *V<sub>U</sub>* is the entire volume of Intramammary Infusion, in mL, in one syringe; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak area and the average peak area of the cephapirin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cephapirin Sodium

$C_{17}H_{16}N_3NaO_6S_2$  445.45

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 3-[(acetyl-oxy)methyl]-8-oxo-7-[[4-(pyridinylthio)acetyl]amino]-, monosodium salt, (6*R*-trans)-.

Monosodium (6*R*,7*R*)-3-(hydroxymethyl)-8-oxo-7-[2-(4-pyridylthio)acetamido]-5-thia-1-azabicyclo-[4.2.0]-oct-2-ene-2-carboxylate acetate (ester) [24356-60-3].

» Cephapirin Sodium has a potency equivalent to not less than 855  $\mu$ g and not more than 1000  $\mu$ g of cephapirin ( $C_{17}H_{17}N_3O_6S_2$ ) per mg.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Cephapirin Sodium RS

USP Endotoxin RS

**Identification**—

A: *Infrared Absorption* (197K).

B: It responds to the tests for *Sodium* (191).

**Crystallinity** (695): meets the requirements.

**pH** (791): between 6.5 and 8.5, in a solution containing 10 mg of cephapirin per mL.

**Water**, *Method I* (921): not more than 2.0%.

**Other requirements**—Where the label states that Cephapirin Sodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Cephapirin for Injection*. Where the label states that Cephapirin Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Cephapirin for Injection*.

**Assay**—

*Solution A, Solution B, Mobile phase, Extraction solution, Dilution buffer, 10% Acetic acid solution, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Cephapirin Benzathine.

*Assay preparation*—In duplicate, weigh about 50 mg of Cephapirin Sodium, and transfer into a 25-mL volumetric flask. Add about 2.5 mL of *Extraction solution* and 15.0 mL of *Dilution buffer*, and mix to dissolve. Add 7.0 mL of acetonitrile, and mix. Allow the flask to return to room temperature, and dilute with water to volume.

*Procedure*—Separately inject equal volumes (about 2  $\mu$ L) of the duplicate *Standard preparation* and the duplicate *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in  $\mu$ g, of cephapirin ( $C_{17}H_{17}N_3O_6S_2$ ) in each mg of Cephapirin Sodium taken by the formula:

$$P(W_S / W_U)(V_U / V_S)(r_U / r_S)$$

in which *P* is the assigned potency, in  $\mu$ g of cephapirin per mg, of USP Cephapirin Sodium RS; *W<sub>S</sub>* and *W<sub>U</sub>* are the quantities of USP Cephapirin Sodium RS and Cephapirin Sodium, in mg, used to prepare the *Standard preparation* and the *Assay preparation*, respectively; *V<sub>U</sub>* and *V<sub>S</sub>* are the final volumes, in mL, of the *Assay preparation* and the *Standard*

preparation, respectively; and  $r_u$  and  $r_s$  are the average peak areas of the cephapirin peaks obtained from the Assay preparation and the Standard preparation, respectively.

## Cephapirin for Injection

» Cephapirin for Injection contains an amount of Cephapirin Sodium equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of cephapirin.

**Packaging and storage**—Preserve in Containers for Sterile Solids as described under Injections (1).

**USP Reference standards** (11)—

USP Cephapirin Sodium RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for Constituted Solutions under Injections (1).

**Bacterial endotoxins** (85)—It contains not more than 0.17 USP Endotoxin Unit per mg of cephapirin.

**Sterility** (71)—It meets the requirements when tested as directed for Membrane Filtration under Test for Sterility of the Product to be Examined.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It responds to the Identification tests and meets the requirements for Crystallinity, pH, and Water under Cephapirin Sodium. It meets also the requirements for Uniformity of Dosage Units (905) and Labeling under Injections (1).

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of water, dimethylformamide, glacial acetic acid, and 11.7 N potassium hydroxide (1834:160:4:2). Make adjustments if necessary (see System Suitability under Chromatography (621)). Increase the proportion of dimethylformamide to decrease the retention time of cephapirin.

**Resolution solution**—Prepare a solution of Cephapirin Sodium in pH 2.0 hydrochloric acid buffer (see Buffer Solutions in the section Reagents, Indicators, and Solutions) containing about 1 mg per mL. Place 10 mL of this solution in a test tube, and heat at 95° for 10 minutes, accurately timed. Promptly cool the tube in an ice water bath. Dilute 5 mL of the cooled solution with Mobile phase to obtain 50 mL of Resolution solution.

**Standard preparation**—Transfer about 21 mg of USP Cephapirin Sodium RS, accurately weighed, to a 100-mL volumetric flask, dilute with Mobile phase to volume, and mix. This solution contains about 0.2 mg of cephapirin per mL.

**Assay preparation 1** (where it is packaged for dispensing and is represented as being in a single-dose container)—Constitute Cephapirin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution containing the equivalent of about 0.2 mg of cephapirin per mL.

**Assay preparation 2** (where the label states the quantity of cephapirin in a given volume of constituted solution)—Constitute Cephapirin for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively, and stepwise if necessary, with Mobile phase to obtain a solution containing the equivalent of about 0.2 mg of cephapirin per

mL. [NOTE—Use the Standard preparation and the Assay preparation within 1 hour.]

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the Resolution solution, and record the peak responses as directed for Procedure: the resolution,  $R$ , between the cephapirin peak and the peak having a retention time of about 0.9 relative to that of cephapirin is not less than 0.9. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the relative retention times are about 0.9 for cephapirin lactone and 1.0 for cephapirin; the column efficiency determined from the cephapirin peak is not less than 1200 theoretical plates; the tailing factor for the cephapirin peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the Standard preparation and the appropriate Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cephapirin ( $C_{17}H_{17}N_3O_6S_2$ ) withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$(L/D)(CP/1000)(r_u / r_s)$$

in which  $L$  is the labeled quantity, in mg, of cephapirin in the single-dose container, or in the volume of constituted solution taken;  $D$  is the concentration, in mg per mL, of cephapirin in Assay preparation 1 or in Assay preparation 2, on the basis of the labeled quantity in the container, or in the portion of constituted solution taken, respectively, and the extent of dilution;  $C$  is the concentration, in mg per mL, of USP Cephapirin Sodium RS in the Standard preparation;  $P$  is the potency, in µg of cephapirin per mg, of USP Cephapirin Sodium RS; and  $r_u$  and  $r_s$  are the cephapirin peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Cephapirin Sodium Intramammary Infusion

» Cephapirin Sodium Intramammary Infusion is a suspension of Cephapirin Sodium in a suitable vegetable oil vehicle. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled quantity of cephapirin ( $C_{17}H_{17}N_3O_6S_2$ ). It contains a suitable dispersing agent.

**Packaging and storage**—Preserve in well-closed unit-dose disposable syringes at controlled room temperature.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Cephapirin Sodium RS

**Identification, Infrared Absorption** (197K)—Prepare the test specimen as follows. Transfer the contents of 1 syringe of Intramammary Infusion to a 50-mL centrifuge tube, add 25 mL of toluene, mix for about 1 minute, and centrifuge. Remove and discard the toluene layer without disturbing the residue in the centrifuge tube. Wash the residue with two 25-mL portions of toluene. Dry the residue in vacuum at 60°, and use the dried residue as the test specimen. Mix the dried residue with 9 parts of potassium bromide, and record the IR spectrum, using the diffuse reflectance technique: the IR absorption spectrum so obtained corresponds

to that of a similar dispersion of USP Cephapirin Sodium RS in potassium bromide.

**Water, Method I** (921): not more than 1.0%, 10 mL of Intramammary Infusion being tested.

#### Assay—

*Solution A, Solution B, Mobile phase, Extraction solution, Dilution buffer, 10% Acetic acid solution, System suitability solution, Standard preparation, and Chromatographic system—*Proceed as directed in the Assay under *Cephapirin Benzathine*.

*Assay preparation—*Express the entire contents of a syringe of the Intramammary Infusion into a centrifuge tube. For each mL of Intramammary Infusion, add 1.0 mL *n*-heptane and 1.0 mL of *Extraction solution*, cap, and mix on a vortex mixer at high speed for 5 minutes. Centrifuge for 5 minutes at a speed sufficient to break the emulsion. Remove the aqueous layer, and pass through a 0.45- $\mu$ m nylon filter, discarding the first 0.5 mL. Transfer 2.5 mL of the filtered aqueous phase into a 25-mL volumetric flask that contains a solution composed of 15.0 mL of *Dilution buffer* and 7.0 mL of acetonitrile. Add water to volume, and mix well to obtain a single phase.

*Procedure—*Separately inject equal volumes (about 2  $\mu$ L) of the duplicate *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the major peaks. Calculate the quantity, in mg, of cephalapirin ( $C_{17}H_{17}N_3O_6S_2$ ) in each syringe of Intramammary Infusion taken by the formula:

$$10PW(V_U / V_S)(r_U / r_S)$$

in which *P* is the assigned potency, in  $\mu$ g of cephalapirin per mg, of USP Cephapirin Sodium RS; *W* is the quantity of USP Cephapirin Sodium RS, in mg, used to prepare the *Standard preparation*; *V<sub>S</sub>* is the final volume, in mL, of the *Standard preparation*; *V<sub>U</sub>* is the entire volume of Intramammary Infusion, in mL, in one syringe; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak area and the average peak area of the cephalapirin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cephadrine

$C_{16}H_{19}N_3O_4S$  349.40

5-Thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[(amino-1,4-cyclohexadien-1-ylacetyl)amino]-3-methyl-8-oxo-, [6*R*-[6 $\alpha$ ,7 $\beta$ (*R*\*)]]-

(6*R*,7*R*)-7-[(*R*)-2-Amino-2-(1,4-cyclohexadien-1-yl)acetamido]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid [38821-53-3].

Monohydrate 367.43 [31828-50-9(non-stoichiometric hydrate)].

Dihydrate 385.44 [58456-86-3].

» Cephadrine has a potency of not less than 900  $\mu$ g and not more than 1050  $\mu$ g of total cephalosporins per mg, calculated as the sum of cephaladrine ( $C_{16}H_{19}N_3O_4S$ ) and cephalixin ( $C_{16}H_{17}N_3O_4S$ ), calculated on the anhydrous basis.

**Packaging and storage—**Preserve in tight containers.

**Labeling—**Where it is the dihydrate form, the label so indicates. Where the quantity of cephaladrine is indicated in the labeling of any preparation containing Cephadrine, this shall be understood to be in terms of anhydrous cephaladrine ( $C_{16}H_{19}N_3O_4S$ ). Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

#### USP Reference standards (11)—

USP Cephadrine RS

USP Cephalixin RS

USP Endotoxin RS

**Identification, Infrared Absorption** (197K).

**Crystallinity** (695): meets the requirements.

**pH** (791): between 3.5 and 6.0, in a solution containing 10 mg per mL.

**Water, Method I** (921): not more than 6.0%, except that if it is the dihydrate form, the limit is between 8.5% and 10.5%.

**Limit of cephalixin—**Using the chromatogram of the *Assay preparation* obtained in the Assay, calculate the percentage of cephalixin ( $C_{16}H_{17}N_3O_4S$ ) in the portion of Cephadrine taken by the formula:

$$100(r_{UX} / r_U)$$

in which *r<sub>UX</sub>* is the cephalixin peak response in the chromatogram obtained from the *Assay preparation*, and *r<sub>U</sub>* is the sum of the cephalixin and cephaladrine peak responses in the chromatogram obtained from the *Assay preparation*: not more than 5.0%, calculated on the anhydrous basis, is found.

**Other requirements—**Where the label states that Cephadrine is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Cephadrine for Injection*. Where the label states that Cephadrine must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Cephadrine for Injection*.

#### Assay—

*Mobile phase—*Prepare a mixture of water, methanol, 0.5 M sodium acetate, and 0.7 N acetic acid (782:200:15:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). Filter the solution through a filter of 1  $\mu$ m or finer porosity, and degas before use.

*Standard preparation—*Dissolve an accurately weighed quantity of USP Cephadrine RS quantitatively in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.

*Resolution solution—*Prepare a solution in *Mobile phase* containing in each mL about 0.5 mg of USP Cephadrine RS and 0.5 mg of USP Cephalixin RS.

*Assay preparation—*Transfer about 50 mg of Cephadrine, accurately weighed, to a 100-mL volumetric flask, add about 30 mL of *Mobile phase*, and sonicate. Dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.8 for cephalixin and 1.0 for cephaladrine; and the resolution, *R*, between the cephalixin peak and the cephaladrine peak is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in  $\mu$ g, of total cephalosporins (sum of cephradine and cephalixin) in each mg of the Cephadrine taken by the formula:

$$100(CP / M)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cephadrine RS in the *Standard preparation*; P is the designated potency, in  $\mu$ g per mg, of USP Cephadrine RS; M is the quantity, in mg, of Cephadrine taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the sums of the cephradine and cephalixin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cephadrine Capsules

» Cephadrine Capsules contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cephradine, calculated as the sum of cephradine ( $C_{16}H_{19}N_3O_4S$ ) and cephalixin ( $C_{16}H_{17}N_3O_4S$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—The quantity of cephradine stated in the labeling is in terms of anhydrous cephradine ( $C_{16}H_{19}N_3O_4S$ ).

**USP Reference standards** (11)—

USP Cephadrine RS

USP Cephalixin RS

**Identification**—Mix the contents of 1 Capsule with water to obtain a solution having a concentration of about 3 mg of cephradine per mL, and filter (*test solution*). Place a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of binder-free silica gel in a chamber containing a mixture of *n*-hexane and tetradecane (95:5) to a depth of about 1 cm, allow the solvent front to move the length of the plate, remove the plate from the chamber, and allow the solvent to evaporate. On this plate apply 10  $\mu$ L each of the *test solution* and a *Standard solution* containing 3 mg of USP Cephadrine RS per mL. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of 0.1 M citric acid, 0.1 M dibasic sodium phosphate, and a 1 in 15 solution of ninhydrin in acetone (60:40:1.5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, dry the plate for 10 minutes at 110°, and examine the chromatogram: the  $R_f$  value of the principal spot obtained from the *test solution* corresponds to that obtained from the *Standard solution*.

**Dissolution** (711)—

*Medium*: 0.12 N hydrochloric acid; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 45 minutes.

**Procedure**—Determine the amount of  $C_{16}H_{19}N_3O_4S$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 255 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Cephadrine RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_4S$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, of the mixed contents of 4 Capsules in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: the Capsule contents lose not more than 7.0% of their weight.

**Assay**—

*Mobile phase*, *Standard preparation*, *Resolution solution*, and *Chromatographic system*—Proceed as directed in the Assay under Cephadrine.

*Assay preparation*—Transfer, as completely as possible, the contents of not fewer than 20 Capsules to a suitable tared container, determine the average weight per Capsule, and mix the combined contents. Transfer an accurately weighed portion of the powder, equivalent to about 125 mg of cephradine, to a 250-mL volumetric flask, add 50 mL of *Mobile phase*, sonicate for about 15 minutes, and shake by mechanical means for about 10 minutes. Dilute with *Mobile phase* to volume, and mix. Filter a portion of this mixture through a filter having a porosity of 0.5  $\mu$ m or finer, discarding the first 5 mL of the filtrate. Use the filtrate as the *Assay preparation*.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard cephradine preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cephradine (sum of cephradine and cephalixin) in the portion of Capsules taken by the formula:

$$0.25CP(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cephadrine RS in the *Standard preparation*; P is the designated potency, in  $\mu$ g per mg, of USP Cephadrine RS; and  $r_U$  and  $r_S$  are the sums of the cephradine and cephalixin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cephadrine for Injection

» Cephadrine for Injection contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of cephradine, calculated as the sum of cephradine ( $C_{16}H_{19}N_3O_4S$ ) and cephalixin ( $C_{16}H_{17}N_3O_4S$ ).

**Packaging and storage**—Preserve in Containers for Sterile Solids as described under *Injections* (1).

**USP Reference standards** (11)—

USP Cephadrine RS

USP Cephalixin RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Identification**—Dilute the contents of 1 container of Cephadrine for Injection with water to obtain a test solution containing about 3 mg of cephradine per mL. Proceed as directed in the *Identification* test under *Cephadrine Capsules*, beginning with "Place a suitable thin-layer chromatographic plate": the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the *Standard solution*.

**Bacterial endotoxins** (85)—It contains not more than 0.20 USP Endotoxin Unit per mg of cephradine.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 8.0 and 9.6, in a solution containing 10 mg per mL.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours; it loses not more than 5.0% of its weight.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements for *Uniformity of Dosage Units* (905) and *Labeling under Injections* (1).

**Assay—**

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the Assay under *Cephadrine*.

*Assay preparation 1* (where it is represented as being in a single-dose container)—Constitute Cephadrine for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with *Mobile phase* to obtain a solution containing about 0.5 mg of cephadrine per mL.

*Assay preparation 2* (where the label states the quantity of cephadrine in a given volume of constituted solution)—Constitute Cephadrine for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with *Mobile phase* to obtain a solution containing about 0.5 mg of cephadrine per mL.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and *Assay preparation 1* or *Assay preparation 2* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cephadrine (sum of cephadrine and cephalixin) withdrawn from the container, or in the portion of constituted solution taken by the formula:

$$(CP)(L / 1000D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cephadrine RS in the *Standard preparation*; P is the designated potency, in  $\mu$ g per mg, of USP Cephadrine RS; L is the labeled quantity, in mg of cephadrine, in the container taken to prepare *Assay preparation 1*, or in the volume of constituted solution taken to prepare *Assay preparation 2*; D is the concentration, in mg of cephadrine per mL, of *Assay preparation 1* or *Assay preparation 2*, based on the labeled quantity in the container or in the portion of constituted solution taken, respectively, and the extent of dilution; and  $r_U$  and  $r_S$  are the sums of the cephadrine and cephalixin peak responses obtained from *Assay preparation 1* or *Assay preparation 2* and the *Standard preparation*, respectively.

## Cephadrine for Oral Suspension

» Cephadrine for Oral Suspension is a dry mixture of Cephadrine and one or more suitable buffers, colors, diluents, and flavors. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of cephadrine, calculated as the sum of cephadrine ( $C_{16}H_{19}N_3O_4S$ ) and cephalixin ( $C_{16}H_{17}N_3O_4S$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cephadrine RS  
USP Cephalixin RS

**Identification**—Constitute 1 container of Cephadrine for Oral Suspension as directed in the labeling. Mix a portion of the resulting suspension with water to obtain a concentration of about 3 mg of cephadrine per mL, and filter (*test solution*). Proceed as directed in the *Identification* test under *Cephadrine Capsules*, beginning with "Place a suitable thin-layer chromatographic plate": the  $R_f$  value of the principal spot obtained from the *test solution* corresponds to that obtained from the *Standard solution*.

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 3.5 and 6.0, in the suspension constituted as directed in the labeling.

**Water, Method I** (921): not more than 1.5%.

**Assay—**

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the Assay under *Cephadrine*.

*Assay preparation*—Constitute Cephadrine for Oral Suspension as directed in the labeling. Dilute an accurately measured volume of the suspension so obtained, freshly mixed and free from air bubbles, quantitatively with *Mobile phase* to obtain a solution containing about 0.5 mg of cephadrine per mL. Filter a portion of this mixture through a filter having a porosity of 0.5  $\mu$ m or finer, discarding the first 5 mL of the filtrate. Use the filtrate as the *Assay preparation*.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cephadrine (sum of cephadrine and cephalixin) in each mL of constituted Oral Suspension taken by the formula:

$$(CP)(L / 1000D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cephadrine RS in the *Standard preparation*; P is the designated potency, in  $\mu$ g per mg, of USP Cephadrine RS; L is the labeled quantity, in mg of cephadrine, in each mL of the constituted Oral Suspension; D is the concentration, in mg of cephadrine per mL, of the *Assay preparation*, based on the labeled quantity of cephadrine per mL of constituted Oral Suspension and the extent of dilution; and  $r_U$  and  $r_S$  are the sums of the cephadrine and cephalixin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cephadrine Tablets

» Cephadrine Tablets contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cephadrine, calculated as the sum of cephadrine ( $C_{16}H_{19}N_3O_4S$ ) and cephalixin ( $C_{16}H_{17}N_3O_4S$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cephadrine RS  
USP Cephalixin RS

**Identification**—Mix a quantity of finely powdered Tablets with water to obtain a concentration of about 3 mg of cephadrine per mL, and filter (*Test solution*). Proceed as directed in the *Identification* test under *Cephadrine Capsules*, beginning with "Place a suitable thin-layer chromatographic

plate": the  $R_F$  value of the principal spot obtained from the test solution corresponds to that obtained from the *Standard solution*.

#### Dissolution <711>—

*Medium:* 0.12 N hydrochloric acid; 900 mL.

*Apparatus 2:* 75 rpm.

*Time:* 60 minutes.

*Procedure*—Determine the amount of  $C_{16}H_{19}N_3O_4S$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 255 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a *Standard solution* having a known concentration of USP Cephadrine RS in the same medium.

*Tolerances*—Not less than 85% (Q) of the labeled amount of  $C_{16}H_{19}N_3O_4S$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 6.0%.

#### Assay—

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the Assay under Cephadrine.

*Assay preparation*—Place not less than 5 Tablets in a high-speed glass blender jar containing an accurately measured volume of water, sufficient to yield a concentration of not less than 5 mg of cephadrine per mL, and blend for  $4 \pm 1$  minutes. Dilute an accurately measured volume of this stock solution quantitatively and stepwise with *Mobile phase* to obtain an *Assay preparation* containing about 0.5 mg of cephadrine per mL.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cephadrine (sum of cephadrine and cephalixin) in each Tablet taken by the formula:

$$(CP)(L / 1000D)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cephadrine RS in the *Standard preparation*; P is the designated potency, in  $\mu$ g per mg, of USP Cephadrine RS; L is the labeled quantity, in mg of cephadrine, in each Tablet; D is the concentration, in mg of cephadrine per mL, of the *Assay preparation*, based on the labeled quantity per Tablet, the number of Tablets taken, and the extent of dilution; and  $r_U$  and  $r_S$  are the sums of the cephadrine and cephalixin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cetirizine Hydrochloride

$C_{21}H_{25}ClN_2O_3 \cdot 2HCl$  461.81  
 ( $\pm$ )-[2-[4-[(4-Chlorophenyl)phenylmethyl]-1-piperazinyl]ethoxy]acetic acid, dihydrochloride;  
 ( $\pm$ )-[2-[4-(*p*-Chloro- $\alpha$ -phenylbenzyl)-1-piperazinyl]ethoxy]acetic acid, dihydrochloride [83881-52-1].

#### DEFINITION

Cetirizine Hydrochloride contains NLT 98.0% and NMT 102.0% of  $C_{21}H_{25}ClN_2O_3 \cdot 2HCl$ , calculated on the dried basis.

#### IDENTIFICATION

##### A. INFRARED ABSORPTION <197K>

- **B. IDENTIFICATION TEST—GENERAL, Chloride** (191): Meets the requirements

#### ASSAY

##### PROCEDURE

**Mobile phase:** Acetonitrile, water, and 1 M sulfuric acid (93:6.6:0.4)

**Standard solution:** 0.5 mg/mL USP Cetirizine Hydrochloride RS in *Mobile phase*

**Sample solution:** 0.5 mg/mL Cetirizine Hydrochloride in *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L3

**Flow rate:** 1 mL/min

**Injection size:** 10  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{21}H_{25}ClN_2O_3 \cdot 2HCl$  in the portion of Cetirizine Hydrochloride taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Cetirizine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Cetirizine Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

#### IMPURITIES

##### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.2%

- **HEAVY METALS, Method I** (231): 10 ppm

##### Organic Impurities

[NOTE—It is recommended that *Test 2* be performed if either cetirizine ethanol (2-[4-[(4-chlorophenyl)phenylmethyl]piperazin-1-yl]ethanol) or cetirizine acetic acid (2-[4-[(4-chlorophenyl)phenylmethyl]piperazin-1-yl]acetic acid) may be present in the test substance.]

##### PROCEDURE 1

**Mobile phase and Sample solution:** Proceed as directed in the Assay.

**System suitability solution:** 4  $\mu$ g/mL each of USP Cetirizine Hydrochloride RS and USP Cetirizine Related Compound A RS in *Mobile phase*

**Standard solution:** 0.5  $\mu$ g/mL of USP Cetirizine Hydrochloride RS in *Mobile phase*

**Chromatographic system:** Prepare as directed in the Assay.

(See *Chromatography* (621), *System Suitability*.)

**Run time:** Three times the retention time of cetirizine

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0 for cetirizine, *System suitability solution*

**Resolution:** NLT 2.0 between cetirizine and cetirizine related compound A, *System suitability solution*

**Relative standard deviation:** NMT 2.0% cetirizine, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of each impurity in the portion of Cetirizine hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- $r_U$  = peak response for each impurity from the *Sample solution*  
 $r_S$  = peak response for cetirizine from the *Standard solution*  
 $C_S$  = concentration of USP Cetirizine Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Cetirizine Hydrochloride in the *Sample solution* (mg/mL)  
 $F$  = relative response factor (see *Impurity Table 1* for values)

**Acceptance criteria:** See *Impurity Table 1*.

**Total impurities:** NMT 0.3%. [NOTE— Disregard peaks below 0.02%.]

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
4-CBH <sup>a</sup>	0.3	1.4	0.1
Dimer <sup>b</sup>	0.5	1.8	0.1
2-Chlorocetirizine <sup>c</sup>	0.85	0.49	0.1

Any individual unspecified impurity	—	1.0	0.1

<sup>a</sup> 4-Chlorobenzhydrol.

<sup>b</sup> 1,4-Bis[(4-chlorophenyl)phenylmethyl]piperazine.

<sup>c</sup> 2-[2-[4-[(2-Chlorophenyl)phenylmethyl]piperazin-1-yl]ethoxy]acetic acid.

<sup>d</sup> 2-[2-[4-[(4-Chlorophenyl)phenylmethyl]piperazin-1-yl]ethoxy]acetic acid, ethyl ester (cetirizine ethyl ester).

<sup>e</sup> 2-[2-[4-(Diphenylmethyl)piperazin-1-yl]ethoxy]acetic acid.

<sup>f</sup> 1-[(4-Chlorophenyl)phenylmethyl]piperazine.

#### • PROCEDURE 2

**Solution A:** 2 g/L tetrabutyl ammonium hydrogen sulfate and 3 g/L of monobasic sodium phosphate monohydrate in water. Adjust with 1 N sodium hydroxide to a pH of  $2.8 \pm 0.05$ .

**Solution B:** Methanol

**Buffer:** 1.4 g/L monobasic sodium phosphate monohydrate and 2.7 g/L of dibasic sodium phosphate heptahydrate. Adjust with either 1 N sodium hydroxide or 10% phosphoric acid to a pH of  $6.9 \pm 0.1$ .

**Diluent:** Acetonitrile and *Buffer* (1:1)

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)	Flow Rate (mL/min)
0	58	42	1.2
40	58	42	1.2
68	20	80	1.5
108	20	80	1.5
110	58	42	1.2
120	58	42	1.2

**Standard solution:** 2 µg/mL of USP Cetirizine Hydrochloride RS in *Diluent*

**Sample solution:** 2 mg/mL cetirizine hydrochloride in *Diluent*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 232 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Column temperature:** 40°

**Injection size:** 10 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2

**Column efficiency:** NLT 6000 theoretical plates

**Relative standard deviation:** NMT 5.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Cetirizine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- $r_U$  = peak response for each impurity from the *Sample solution*  
 $r_S$  = peak response for cetirizine from the *Standard solution*  
 $C_S$  = concentration of USP Cetirizine Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Cetirizine Hydrochloride in the *Sample solution* (mg/mL)  
 $F$  = relative response factor (see *Impurity Table 2* for values)

**Acceptance criteria:** See *Impurity Table 2*.

**Total impurities:** NMT 0.3%. [NOTE— Disregard peaks below 0.05%.]

**Impurity Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

k 1,4-Bis[(4-chlorophenyl)phenylmethyl]piperazine.

**SPECIFIC TESTS**

- **pH (791):** 1.2–1.8, in an aqueous solution 1 in 20
- **Loss on Drying (731):** Dry a sample at 105° to a constant weight: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light and moisture. Store at room temperature.
- **LABELING:** Label it to indicate with which impurity procedures the article complies.
- **USP REFERENCE STANDARDS (11)**  
USP Cetirizine Hydrochloride RS  
USP Cetirizine Related Compound A RS  
(RS)-2-[2-[4-[(4-Chlorophenyl)phenylmethyl]piperazin-1-yl]ethoxy]acetic acid ethyl ester dihydrochloride.  
C<sub>23</sub>H<sub>29</sub>ClN<sub>2</sub>O<sub>3</sub> · 2HCl 489.86

**Cetirizine Hydrochloride Oral Solution****DEFINITION**

Cetirizine Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of C<sub>21</sub>H<sub>25</sub>ClN<sub>2</sub>O<sub>3</sub> · 2HCl.

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Meets the requirements

**ASSAY**• **PROCEDURE**

**Solution A:** Acetonitrile

**Solution B:** 1.36 g/L of monobasic potassium phosphate in water. Adjust with a 2% solution of phosphoric acid in water to a pH of 3.5 ± 0.05.

**Diluent:** Acetonitrile and water (3:7)

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	5	95
15	5	95

Time (min)	Solution A (%)	Solution B (%)
22	25	75
35	25	75
40	5	95
50	5	95

**Standard stock solution:** 5 mg/mL of USP Cetirizine Hydrochloride RS in water

**Standard solution:** 0.1 mg/mL of USP Cetirizine Hydrochloride RS in *Diluent*, from the *Standard stock solution*

**Sample solution:** Transfer an amount of Oral Solution to a suitable volumetric flask to obtain a nominal concentration of 0.1 mg/mL of cetirizine hydrochloride. Dissolve in 60% of the flask volume of *Diluent* by swirling. Sonicate 3 min, and dilute with *Diluent* to volume. Pass through a suitable filter.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 233 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L10

#### SPECIFIC TESTS

• **PH** (791): 4.0–5.1

• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 100 cfu/mL, and the total combined molds and yeasts count does not exceed 10 cfu/mL. It meets the requirements of the tests for absence of *Escherichia coli*.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and protect from light. Store at controlled room temperature or in a cold place.
- **USP REFERENCE STANDARDS** (11)  
USP Cetirizine Hydrochloride RS

## Cetirizine Hydrochloride Tablets

#### DEFINITION

Cetirizine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of  $C_{21}H_{25}ClN_2O_3 \cdot 2HCl$ .

#### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

**Solution A:** 2 N sulfuric acid and water (2:33)

**Buffer:** 2.9 mL/L of phosphoric acid in water

**Mobile phase:** Acetonitrile and *Buffer* (3:7)

**Diluent:** Acetonitrile, *Solution A*, and water (100:1:100)

**Standard solution:** 0.2 mg/mL of USP Cetirizine Hydrochloride RS in *Diluent*

**Sample solution:** 0.2 mg/mL of cetirizine hydrochloride in *Diluent*, from NLT 20 powdered Tablets. [NOTE—Sonicate, if necessary.]

##### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10 µL

**Run time:** 1.3 times the retention time of cetirizine

##### System suitability

Sample: *Standard solution*

##### Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

##### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{21}H_{25}ClN_2O_3 \cdot 2HCl$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Cetirizine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cetirizine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION (711)

Medium: Water; 900 mL, degassed

Apparatus 2: 50 rpm

Time: 30 min

Buffer: 2.9 mL/L of phosphoric acid in water

Mobile phase: Acetonitrile and *Buffer* (2:3)

**Standard solution:** 11 µg/mL of USP Cetirizine Hydrochloride RS in water. This solution can be stored for 48 h at room temperature.

**Sample solution:** Pass a portion of the solution under test through a suitable 0.45-µm filter.

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 230 nm**Column:** 4.6-mm × 25-cm; 5-μm packing L1**Flow rate:** 1 mL/min**Injection size:** 50 μL**Run time:** 1.3 times the retention time of cetirizine**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 2.0%

Calculate the percentage of cetirizine dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

 $r_U$  = peak response from the *Standard solution* $r_S$  = peak response from the *Sample solution* $C_S$  = concentration of the *Standard solution* (mg/mL) $L$  = Tablet label claim, mg $V$  = volume of *Medium*, 900 mL**Tolerances:** NLT 80% (Q) of the labeled amount of cetirizine hydrochloride is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

**IMPURITIES****Organic Impurities**• **PROCEDURE****Solution A:** 2 N sulfuric acid and water (2:33)**Buffer:** 3.4 g/L of tetrabutyl ammonium hydrogen sulfate in water**Diluent:** Acetonitrile, *Solution A*, and water (910:27:63)**Mobile phase:** Acetonitrile, *Solution A*, and *Buffer* (93:5:2)**Standard solution:** 1.5 μg/mL of USP Cetirizine Hydrochloride RS in *Diluent***Sample solution:** 0.5 mg/mL of cetirizine hydrochloride in *Diluent*, from NLT 20 powdered Tablets. USP Cetirizine Hydrochloride RS

## Cetirizine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets

**DEFINITION**Cetirizine Hydrochloride and Pseudoephedrine Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of cetirizine hydrochloride (C<sub>21</sub>H<sub>25</sub>ClN<sub>2</sub>O<sub>3</sub> · 2HCl) and pseudoephedrine hydrochloride (C<sub>10</sub>H<sub>15</sub>NO · HCl).**IDENTIFICATION**

- The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **CETIRIZINE HYDROCHLORIDE****Buffer:** 3.5 g/L of monobasic ammonium phosphate and 1.0 g/L of tetrabutylammonium bisulfate in water. Adjust with phosphoric acid to a pH of 2.5.**Diluent:** Methanol and *Buffer* (2:3)**Solution A:** Acetonitrile, methanol, and *Buffer* (9:2:29)**Solution B:** Acetonitrile**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
27.0	100	0
30.0	0	100
30.1	100	0
35.0	100	0

**Standard stock solution:** 0.5 mg/mL of USP Cetirizine Hydrochloride RS in *Diluent*. [NOTE—Sonicate to dissolve.]**Standard solution:** 0.025 mg/mL of USP Cetirizine Hydrochloride RS in *Diluent* from the *Standard stock solution***Sample solution:** 0.025 mg/mL of cetirizine hydrochloride (from NMT 10 finely powdered Tablets) prepared as follows. Dissolve the Tablets first in methanol, using 22.5% of the final flask volume. Sonicate for NLT 20

min with vigorous swirling every 5 min. To the solution add a volume of *Buffer* equal to 26% of the final flask volume. Allow the solution to equilibrate to room temperature. Dilute with *Diluent* to volume. Pass a portion through a membrane filter of 0.45- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm  $\times$  15-cm; 3.5- $\mu$ m packing L1

**Column temperature:** 30°

**Autosampler temperature:** 5°

**Flow rate:** 1 mL/min

**Injection size:** 25  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 3000 theoretical plates

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of cetirizine hydrochloride ( $C_{21}H_{25}ClN_2O_3 \cdot 2HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of cetirizine from the *Sample solution*

$r_S$  = peak response of cetirizine from the *Standard solution*

$C_S$  = concentration of USP Cetirizine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cetirizine hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### • PSEUDOEPHEDRINE HYDROCHLORIDE

**Buffer:** 0.8 g/L of ammonium acetate in water. To 1 L of the solution add 1.0 mL of triethylamine. Adjust with glacial acetic acid to a pH of 4.5.

**Mobile phase:** Acetonitrile and *Buffer* (3:7)

**Standard solution:** 0.5 mg/mL of USP Pseudoephedrine Hydrochloride RS in *Mobile phase*. [NOTE—Sonicate to dissolve.]

**Sample stock solution:** 2.4 mg/mL of pseudoephedrine hydrochloride (from 5 finely powdered Tablets) prepared as follows. Dissolve the crushed Tablets first in acetonitrile, using 24% of the final flask volume. Sonicate for NLT 15 min. To the solution add a volume of *Buffer* equal to 56% of the final flask volume. Sonicate for NLT 15 min. Shake the flask for NLT 10 min. Allow the solution to equilibrate to room temperature. Dilute with *Mobile phase* to volume. Centrifuge a portion for 15 min to obtain a clear supernatant.

**Sample solution:** 0.5 mg/mL of pseudoephedrine hydrochloride in *Mobile phase*, from the *Sample stock solution*. Pass the solution through a membrane filter of 0.45- $\mu$ m pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L9

**Flow rate:** 1.5 mL/min

**Injection size:** 25  $\mu$ L

**Run time:** 2 times the retention time of pseudoephedrine

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of pseudoephedrine from the *Sample solution*

$r_S$  = peak response of pseudoephedrine from the *Standard solution*

$C_S$  = concentration of USP Pseudoephedrine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of pseudoephedrine hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

**Medium:** 0.1 N hydrochloric acid; 500 mL, deaerated

**Apparatus 1:** 100 rpm

**Time:** 30 min for cetirizine hydrochloride and 30 min (used only for adjustments in the calculations), 1, 2, and 6 h for pseudoephedrine hydrochloride

**Buffer:** 0.77 g/L of ammonium acetate in water. To 1 L of the solution add 1.0 mL of triethylamine. Adjust with glacial acetic acid to a pH of  $4.5 \pm 0.05$ .

**Mobile phase:** Acetonitrile and *Buffer* (3:7)

**Standard stock solution:** 0.5 mg/mL of USP Cetirizine Hydrochloride RS in water

**Standard solution:** 0.24 mg/mL of USP Pseudoephedrine Hydrochloride RS and 0.01 mg/mL of USP Cetirizine Hydrochloride RS in *Medium* from the *Standard stock solution*

**Sample solution:** At the times specified, withdraw 5 mL of the solution under test, and pass through a suitable filter of 0.45- $\mu$ m pore size, discarding the first few mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV, 230 nm for cetirizine hydrochloride, 254 nm for pseudoephedrine hydrochloride

**Column:** 4.6-mm  $\times$  15-cm; 5- $\mu$ m packing L9

**Flow rate:** 1.5 mL/min

**Injection size:** 25  $\mu$ L

**Run time:** 2 times the retention time of pseudoephedrine

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for both cetirizine and pseudoephedrine

**Relative standard deviation:** NMT 2.0% for both cetirizine and pseudoephedrine

Calculate the percentage of cetirizine hydrochloride dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response of cetirizine from the *Sample solution*

$r_S$  = peak response of cetirizine from the *Standard solution*

$C_S$  = concentration of cetirizine hydrochloride in the *Standard solution* (mg/mL)

L = cetirizine hydrochloride Tablet label claim (mg)

V = volume of *Medium*, 500 mL

Calculate the percentage of pseudoephedrine hydrochloride dissolved at each time point:

$$Q_{30} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$$Q_1 = (Q_{30} \times 5/500) + [(r_U/r_S) \times (C_S/L) \times 495 \times 100]$$

$$Q_2 = (Q_{30} \times 5/500) + (Q_1 \times 5/495) + [(r_U/r_S) \times (C_S/L) \times 490 \times 100]$$

$$Q_6 = (Q_{30} \times 5/500) + (Q_1 \times 5/495) + (Q_2 \times 5/490) + [(r_U/r_S) \times (C_S/L) \times 485 \times 100]$$

$r_U$  = peak response of pseudoephedrine from the *Sample solution*

$r_S$  = peak response of pseudoephedrine from the *Standard solution*

$C_S$  = concentration of pseudoephedrine hydrochloride in the *Standard solution* (mg/mL)

L = pseudoephedrine hydrochloride Tablet label claim (mg)

V = initial volume of *Medium*, 500 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of cetirizine hydrochloride is dissolved in 30 min. The percentage of the labeled amount of pseudoephedrine hydrochloride dissolved at times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
1	30%–50%
2	50%–70%
6	NLT 80%

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## IMPURITIES

### Organic Impurities

#### • PROCEDURE 1: CETIRIZINE HYDROCHLORIDE RELATED COMPOUNDS

Buffer, Diluent, Solution A and Solution B: Proceed as directed in the *Assay for Cetirizine hydrochloride*.

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
27	100	0
45	60	40
65	60	40
65.1	100	0
75	100	0

**Standard stock solution:** 0.5 mg/mL of USP Cetirizine Hydrochloride RS in *Diluent*. [NOTE—Sonicate to dissolve.]

**Standard solution:** 1 µg/mL of USP Cetirizine Hydrochloride RS in *Diluent* from the *Standard stock solution*

**Sample stock solution:** 0.5 mg/mL of cetirizine hydrochloride (from NMT 10 finely powdered Tablets) prepared as follows. Dissolve the Tablets first in methanol, using 70% of the final flask volume. Sonicate for 15

min, and then shake for 15 min. Allow the solution to cool to room temperature, and dilute with methanol to volume. Centrifuge a portion for 10 min.

**Sample solution:** 0.2 mg/mL of cetirizine hydrochloride in *Buffer*, from the *Sample stock solution*. Pass a portion through a suitable membrane filter of 0.45-µm pore size.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm × 15-cm; 3.5-µm packing L1

**Column temperature:** 30°

**Autosampler temperature:** 5°

**Flow rate:** 1 mL/min

**Injection size:** 25 µL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Column efficiency:** NLT 1300 theoretical

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 5.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of the individual impurity from the *Sample solution*

$r_S$  = peak response of cetirizine from the *Standard solution*

$C_S$  = concentration of USP Cetirizine Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cetirizine hydrochloride in the *Sample solution* (mg/mL)

F = relative response factor (see *Impurity Table 1*)

### Acceptance criteria:

[NOTE—Disregard any peak less than 0.05% of the main peak.]

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 0.8%

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Cetirizineethanol <sup>a</sup>	0.54	1.4	0.3

 USP Ephedrine Sulfate RS  
 USP Pseudoephedrine Hydrochloride RS

## Cetylpyridinium Chloride

$C_{21}H_{38}ClN \cdot H_2O$  358.00

$C_{21}H_{38}ClN$  339.99

Pyridinium, 1-hexadecyl-, chloride, monohydrate;  
 1-Hexadecylpyridinium chloride monohydrate [6004-24-6].  
 Anhydrous [123-03-5].

#### DEFINITION

Cetylpyridinium Chloride contains NLT 99.0% and NMT 102.0% of cetylpyridinium chloride ( $C_{21}H_{38}ClN$ ), calculated on the anhydrous basis.

#### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B. ULTRAVIOLET ABSORPTION** <197U>  
**Sample solution:** 40 µg/mL in water  
**Acceptance criteria:** Meets the requirements
- **C. IDENTIFICATION TESTS—GENERAL, Chloride** <191>

**Sample solution:** 2 mg/mL in water

**Acceptance criteria:** A 10-mL portion of the *Sample solution* meets the requirements, except that when silver nitrate TS is added, turbidity is produced rather than a curdy white precipitate.

#### ASSAY

##### • PROCEDURE

**Sample solution:** Dissolve 200 mg of Cetylpyridinium Chloride in 75 mL of water. Add 10 mL of chloroform, 0.4 mL of bromophenol blue solution (1 in 2000), and 5 mL of a freshly prepared solution of sodium bicarbonate (4.2 in 1000).

**Analysis:** Titrate the *Sample solution* with 0.02 M sodium tetraphenylboron VS until the blue color disappears from the chloroform layer. Add the last portions of the sodium tetraphenylboron solution dropwise, agitating

vigorously after each addition. Each mL of 0.02 M sodium tetraphenylboron is equivalent to 6.800 mg of cetylpyridinium chloride ( $C_{21}H_{38}ClN$ ).

**Acceptance criteria:** 99.0%–102.0% on the anhydrous basis

#### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2% on the anhydrous basis
- **HEAVY METALS**, *Method II* (231): NMT 20 ppm
- **ORGANIC IMPURITIES, PYRIDINE**  
**Sample solution:** Dissolve 1 g in 10 mL of sodium hydroxide solution (1 in 10) without heating.  
**Acceptance criteria:** The odor of pyridine is not immediately perceptible.

#### SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, *Class I* (741): 80°–84°, the preliminary drying treatment being omitted
- **ACIDITY**  
**Analysis:** Dissolve 500 mg in 50 mL of water, add phenolphthalein TS, and titrate with 0.020 N sodium hydroxide.  
**Acceptance criteria:** NMT 2.5 mL is required for neutralization.
- **WATER DETERMINATION**, *Method I* (921): 4.5%–5.5%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Cetylpyridinium Chloride RS

## Cetylpyridinium Chloride Lozenges

#### DEFINITION

Cetylpyridinium Chloride Lozenges contain NLT 90.0% and NMT 125.0% of the labeled amount of cetylpyridinium chloride ( $C_{21}H_{38}ClN \cdot H_2O$ ) in a suitable molded base.

#### IDENTIFICATION

- **A.**  
**Eluting solvent:** Alcohol and 1.2 N hydrochloric acid (7:3)  
**Chromatographic column:** Pack a pledget of fine glass wool in the base of a 10-mm × 200-mm chromatographic tube. Add styrene–divinylbenzene cation-exchange resin (strong acid form) to form a uniform column 12 cm in height, and top the column with a pledget of fine glass wool.  
**Standard solution:** 5 µg/mL of USP Cetylpyridinium Chloride RS in *Eluting solvent*  
**Sample solution:** Dissolve nominally 500 µg of cetylpyridinium chloride from NLT 20 finely powdered Lozenges in 50 mL of water. Immediately transfer this solution to the *Chromatographic column*, and discard the eluate. Wash the column, successively, with 200 mL of water, 100 mL of alcohol, 100 mL of water, and 100 mL of 3 N hydrochloric acid. Discard the washings. Elute the column with 80 mL of *Eluting solvent*. Collect the eluate in a 100-mL volumetric flask, and dilute with the *Eluting solvent* to volume.  
**Instrumental conditions**  
*(See Spectrophotometry and Light-Scattering (851).)*  
**Mode:** UV  
**Wavelength range:** 225–300 nm  
**Analysis**  
**Samples:** *Standard solution* and *Sample solution*  
**Acceptance criteria:** The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of the *Standard solution*.

#### ASSAY

##### • PROCEDURE

**0.004 M sodium lauryl sulfate:** Dissolve 1.15 g of sodium lauryl sulfate in 500 mL of water. Add 2 mL of sulfuric acid, and dilute with water to 1000 mL.

**Standardization of 0.004 M sodium lauryl sulfate:** Determine the molarity of the solution as follows. To a glass-stoppered 100-mL cylinder transfer 10.0 mL of 0.004 M cetylpyridinium chloride (1.432 mg/mL of USP Cetylpyridinium Chloride RS). Add 5 mL of 2 N sulfuric acid, 20 mL of chloroform, and 1 mL of methyl yellow TS. Titrate with the sodium lauryl sulfate solution with frequent vigorous shaking until the chloroform layer acquires the first permanent orange-pink color. Calculate the molarity, and restandardize before each use. [NOTE—Sulfuric acid is included in this solution to inhibit precipitate formation. If a precipitate forms under storage, discard the solution, and prepare and standardize a fresh solution of 0.004 M sodium lauryl sulfate.]

**Sample solution:** Nominally 0.1 mg/mL of cetylpyridinium chloride prepared as follows. Dissolve an accurately determined number of Lozenges (about 100) in about 400 mL of water in a 500-mL volumetric flask, and dilute with water to volume. Transfer a measured aliquot of this solution, equivalent to about 10 mg of cetylpyridinium chloride, to a glass-stoppered, 100-mL cylinder. Add 5 mL of 2 N sulfuric acid, 20 mL of chloroform, and 1 mL of methyl yellow TS. Insert the stopper, and shake until the chloroform layer develops a bright yellow color.

**Analysis:** Titrate with 0.004 M sodium lauryl sulfate, shaking thoroughly after each addition, until the chloroform layer develops the first permanent orange-pink color. Each mL of 0.004 M sodium lauryl sulfate is equivalent to 1.432 mg of cetylpyridinium chloride ( $C_{21}H_{38}ClN \cdot H_2O$ ).

**Acceptance criteria:** 90.0%–125.0%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Cetylpyridinium Chloride RS

## Cetylpyridinium Chloride Topical Solution

#### DEFINITION

Cetylpyridinium Chloride Topical Solution contains NLT 95.0% and NMT 105.0% of the labeled amount of cetylpyridinium chloride ( $C_{21}H_{38}ClN \cdot H_2O$ ).

#### IDENTIFICATION

- **A.**  
**Standard solution:** 40 µg/mL of USP Cetylpyridinium Chloride RS in water  
**Sample solution:** 40 µg/mL of cetylpyridinium chloride from Topical Solution diluted with water  
**Analysis**  
**Samples:** *Standard solution* and *Sample solution*  
**Acceptance criteria:** The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of the *Standard solution*.
- **B. IDENTIFICATION TESTS—GENERAL, Chloride (191)**  
**Sample solution:** Evaporate on a steam bath a volume of Topical Solution equivalent to 500 mg of cetylpyridinium chloride from Topical Solution to one-half of its original volume.  
**Acceptance criteria:** The *Sample solution* meets the requirements, except that when silver nitrate TS is added,

turbidity is produced rather than a curdy white precipitate.

## ASSAY

### • PROCEDURE

**Sample solution:** Add a volume of Topical Solution nominally equivalent to 150 mg of cetylpyridinium chloride to a glass-stoppered, 500-mL graduated cylinder. Add 10 mL of chloroform, 0.4 mL of bromophenol blue solution (1 in 2000), and 5 mL of a freshly prepared solution of sodium bicarbonate (4.2 in 1000).

**Analysis:** Titrate the *Sample solution* with 0.02 M sodium tetraphenylboron VS until the blue color disappears from the chloroform layer. Add the last portions of the sodium tetraphenylboron solution dropwise, agitating vigorously after each addition. Each mL of 0.02 M sodium tetraphenylboron is equivalent to 7.160 mg of cetylpyridinium chloride ( $C_{21}H_{38}ClN \cdot H_2O$ ).

**Acceptance criteria:** 95.0%–105.0%

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** (11)  
USP Cetylpyridinium Chloride RS

## Activated Charcoal

### DEFINITION

Activated Charcoal is the residue from the destructive distillation of various organic materials, treated to increase its adsorptive power.

### IMPURITIES

#### • RESIDUE ON IGNITION (281)

**Sample:** 0.50 g

**Acceptance criteria:** NMT 4.0%

#### • ACID-SOLUBLE SUBSTANCES

**Sample:** 1.0 g

**Analysis:** Boil the *Sample* with a mixture of 20 mL of water and 5 mL of hydrochloric acid for 5 min. Filter into a tared porcelain crucible, and wash the residue with 10 mL of hot water, adding the washing to the filtrate. To the combined filtrate and washing add 1 mL of sulfuric acid. Evaporate to dryness, and ignite to constant weight.

**Acceptance criteria:** The residue weighs NMT 35 mg (NMT 3.5%).

#### • CHLORIDE AND SULFATE, Chloride (221)

**Sample solution:** A 10-mL portion of the filtrate obtained in the test for *Reaction*

**Acceptance criteria:** The *Sample solution* shows no more chloride than is contained in 1.5 mL of 0.020 N hydrochloric acid (NMT 0.2%).

#### • CHLORIDE AND SULFATE, Sulfate (221)

**Sample solution:** A 10-mL portion of the filtrate obtained in the test for *Reaction*

**Acceptance criteria:** The *Sample solution* shows no more sulfate than is contained in 1.0 mL of 0.020 N sulfuric acid (NMT 0.2%).

#### • SULFIDE

**Sample:** 0.50 g

**Analysis:** Place the *Sample* in a small conical flask. Add 20 mL of water and 5 mL of hydrochloric acid, and boil gently.

**Acceptance criteria:** The escaping vapors do not darken paper moistened with lead acetate TS.

#### • CYANOGEN COMPOUNDS

**Sample:** 5 g

**Analysis:** Place the *Sample*, 50 mL of water, and 2 g of tartaric acid in a distilling flask connected to a condenser provided with a tightly fitting adapter, the end of which dips below the surface of a mixture of 2 mL of

1 N sodium hydroxide and 10 mL of water, contained in a small flask surrounded by ice. Heat the mixture in the distilling flask to boiling, and distill about 25 mL. Dilute the distillate with water to 50 mL, and mix. To 25 mL of the diluted distillate add 12 drops of ferrous sulfate TS, heat the mixture almost to boiling, cool, and add 1 mL of hydrochloric acid.

**Acceptance criteria:** No blue color is produced.

#### • HEAVY METALS (231)

**Sample:** 1.0 g

**Test preparation:** Boil the *Sample* with a mixture of 20 mL of 3 N hydrochloric acid and 5 mL of bromine TS for 5 min. Filter, and wash the charcoal and the filter with 50 mL of boiling water. Evaporate the filtrate and washing to dryness, and to the residue add 1 mL of 1 N hydrochloric acid, 20 mL of water, and 5 mL of sulfuric acid. Boil the solution until all of the sulfur dioxide is expelled. Filter if necessary, and dilute with water to 50 mL. To 20 mL of the solution add water to make 25 mL.

**Acceptance criteria:** NMT 50 ppm

#### • UNCARBONIZED CONSTITUENTS

**Sample:** 0.25 g

**Analysis:** Boil the *Sample* with 10 mL of 1 N sodium hydroxide for 5 s, and filter.

**Acceptance criteria:** The filtrate is colorless.

## SPECIFIC TESTS

### • ADSORPTIVE POWER

#### Alkaloids

**Sample:** 1 g, previously dried at 120° for 4 h

**Analysis:** Shake the *Sample* with a solution of 100 mg of strychnine sulfate in 50 mL of water for 5 min, and filter through a dry filter, rejecting the first 10 mL of the filtrate. To a 10-mL portion of the subsequent filtrate add 1 drop of hydrochloric acid and 5 drops of mercuric-potassium iodide TS.

**Acceptance criteria:** No turbidity is produced.

#### Dyes

**Sample:** 250 mg

**Analysis:** Pipet 50 mL of methylene blue solution (1 in 1000) into each of two glass-stoppered, 100-mL flasks. Add the *Sample* to one of the flasks, insert the stopper in the flask, and shake for 5 min. Filter the contents of each flask through a dry filter, rejecting the first 20 mL of each filtrate. Pipet 25-mL portions of the remaining filtrates into two 250-mL volumetric flasks. Add to each flask 50 mL of sodium acetate solution (1 in 10), mix, and add from a buret 35.0 mL of 0.1 N iodine VS, swirling the mixture during the addition. Insert the stoppers in the flasks, and allow them to stand for 50 min, shaking them vigorously at 10-min intervals. Dilute each mixture with water to volume, mix, allow to stand for 10 min, and filter through dry filters, rejecting the first 30 mL of each filtrate. Titrate the excess iodine in a 100-mL aliquot of each subsequent filtrate with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Calculate the mL of 0.1 N iodine consumed in each titration.

**Acceptance criteria:** The difference between the two volumes is NLT 0.7 mL.

• **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

### • REACTION

**Sample:** 3.0 g

**Analysis:** Boil the *Sample* with 60 mL of water for 5 min. Allow to cool, restore the original volume by the addition of water, and filter.

**Acceptance criteria:** The filtrate is colorless and is neutral to litmus.

• **LOSS ON DRYING (731):** Dry a sample at 120° for 4 h: it loses NMT 15.0% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

**Chloral Hydrate**

$C_2H_3Cl_3O_2$  165.40  
1,1-Ethenediol, 2,2,2-trichloro-.  
Chloral hydrate [302-17-0].

» Chloral Hydrate contains not less than 99.5 percent and not more than 102.5 percent of  $C_2H_3Cl_3O_2$ .

**Packaging and storage**—Preserve in tight containers.

**Identification**—Transfer to a 125-mL conical flask a portion of a solution in water equivalent to about 1 mg of chloral hydrate, and add water to bring the volume to about 10 mL. Add 10 mL of 1-ethylquinazolinium iodide solution (15 in 1000), which has been filtered through a 0.45- $\mu$ m filter. Add 60 mL of isopropyl alcohol, 5 mL of an aqueous 0.1 M monoethanolamine solution, and 15 mL of water. Mix, and heat in a water bath at 60° for 15 minutes: a blue color develops.

**Acidity**—A 1 in 20 solution in alcohol does not at once redden moistened blue litmus paper.

**Residue on ignition** (281): not more than 0.1%.

**Chloride** (221)—To a 1 in 10 solution in alcohol add a few drops of silver nitrate TS: any opalescence produced does not exceed that of a control containing 0.10 mL of 0.020 N hydrochloric acid (0.007%).

**Readily carbonizable substances** (271)—Shake 500 mg, at intervals of 5 minutes during 1 hour, with 5 mL of sulfuric acid in a glass-stoppered cylinder that previously has been rinsed with sulfuric acid, and transfer the mixture to a comparison vessel: the mixture has no more color than *Matching Fluid P*.

**Assay**—Dissolve about 4 g of Chloral Hydrate, accurately weighed, in 10 mL of water, add 30.0 mL of 1 N sodium hydroxide VS, and allow the mixture to stand for 2 minutes. Add a few drops of phenolphthalein TS, and titrate the residual alkali at once with 1 N sulfuric acid VS. Each mL of 1 N sodium hydroxide corresponds to 165.4 mg of  $C_2H_3Cl_3O_2$ .

**Chloral Hydrate Capsules**

» Chloral Hydrate Capsules contain not less than 95.0 percent and not more than 110.0 percent of the labeled amount of  $C_2H_3Cl_3O_2$ .

**Packaging and storage**—Preserve in tight containers, preferably at controlled room temperature.

**Identification**—The contents of the Capsules respond to the *Identification* test under *Chloral Hydrate*.

**Dissolution** (711)—

Medium: water; 500 mL.

Apparatus 2: 50 rpm.

Time: 15 minutes.

**Procedure**—Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting

rotation of the blade. Observe the Capsules, and record the time taken for each capsule shell to rupture.

**Tolerances**—The requirements are met if all of the Capsules tested rupture in not more than 15 minutes. If 1 or 2 of the Capsules rupture in more than 15 but not more than 30 minutes, repeat the test on 12 additional Capsules. Not more than 2 of the total of 18 Capsules tested rupture in more than 15 but not more than 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—Place a counted number of Capsules, equivalent to about 2.5 g of chloral hydrate, in a glass-stoppered, 250-mL flask, add 25 mL of water, insert the stopper in the flask, and heat on a steam bath with frequent swirling until the Capsules are dissolved. Cool to room temperature, add 25 mL of neutralized alcohol and 20.0 mL of 1 N sodium hydroxide VS, mix, and allow the mixture to stand for 4 minutes. Add phenolphthalein TS, and titrate the excess alkali with 1 N sulfuric acid VS. Each mL of 1 N sodium hydroxide is equivalent to 165.4 mg of  $C_2H_3Cl_3O_2$ .

**Chloral Hydrate Oral Solution**

» Chloral Hydrate Oral Solution contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of chloral hydrate ( $C_2H_3Cl_3O_2$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Identification**—It meets the requirements for the *Identification* test under *Chloral Hydrate*.

**Assay**—Transfer 25.0 mL of Oral Solution to a 250-mL conical flask with the aid of several portions of water. Add 30.0 mL of 1 N sodium hydroxide VS, and mix. After the mixture has stood for 2 minutes, add 5 drops of phenolphthalein TS, and immediately titrate the excess sodium hydroxide with 1 N sulfuric acid VS. Designate the volume of 1 N sodium hydroxide VS consumed as *A*. Transfer 5.0 mL of Oral Solution to a second 250-mL conical flask with the aid of several portions of water. Add 10 drops of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Designate the volume of 0.1 N sodium hydroxide VS consumed as *B*. Calculate the weight, in mg, of chloral hydrate ( $C_2H_3Cl_3O_2$ ) in the amount of Oral Solution taken by the first titration by the formula:

$$165.4(A - 0.5B).$$

**Chlorambucil**

$C_{14}H_{19}Cl_2NO_2$  304.21  
Benzenebutanoic acid, 4-[[bis(2-chloroethyl)amino]-  
4-[*p*-[Bis(2-chloroethyl)amino]phenyl]butyric acid  
[305-03-3].

» Chlorambucil contains not less than 98.0 percent and not more than 101.0 percent of  $C_{14}H_{19}Cl_2NO_2$ , calculated on the anhydrous basis.

**Caution**—Great care should be taken to prevent inhaling particles of Chlorambucil and exposing the skin to it.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Chlorambucil RS

**Identification**—

**A:** *Infrared Absorption* (197S): 1 in 125 solution, carbon disulfide, 1-mm cell.

**B:** Dissolve 50 mg in 5 mL of acetone, and dilute with water to 10 mL. Add 1 drop of 2 N sulfuric acid, then add 4 drops of silver nitrate TS: no opalescence is observed immediately (*absence of chloride ion*). Warm the solution on a steam bath: opalescence develops (*presence of ionizable chlorine*).

**Melting range** (741): between 65° and 69°.

**Water, Method I** (921): not more than 0.5%.

**Assay**—Dissolve about 200 mg of Chlorambucil, accurately weighed, in 10 mL of acetone, add 10 mL of water, and titrate with 0.1 N sodium hydroxide VS, using phenolphthalein TS as the indicator. Each mL of 0.1 N sodium hydroxide is equivalent to 30.42 mg of C<sub>14</sub>H<sub>19</sub>Cl<sub>2</sub>NO<sub>2</sub>.

## Chlorambucil Tablets

» Chlorambucil Tablets contain not less than 85.0 percent and not more than 110.0 percent of the labeled amount of C<sub>14</sub>H<sub>19</sub>Cl<sub>2</sub>NO<sub>2</sub>.

**Packaging and storage**—Preserve coated Tablets in well-closed containers; preserve uncoated Tablets in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Chlorambucil RS

USP Propylparaben RS

**Identification**—Shake a quantity of finely powdered Tablets, equivalent to about 16 mg of chlorambucil, with 20 mL of carbon disulfide. Filter, evaporate to dryness, and dissolve the residue in 2 mL of carbon disulfide: the resulting solution responds to *Identification test A* under *Chlorambucil*.

**Disintegration** (701)—Place 1 Tablet in each of the six tubes of the basket, and if the Tablet has a soluble external coating, immerse the basket in water at room temperature for 5 minutes. Operate the apparatus, using simulated gastric fluid TS maintained at 37 ± 2° as the immersion fluid. After 30 minutes of operation in simulated gastric fluid TS, lift the basket from the fluid, and observe the Tablets. If the Tablets have not disintegrated completely, substitute simulated intestinal fluid TS maintained at 37 ± 2° as the immersion fluid, and continue the test for a total period of time, including previous exposure to water and simulated gastric fluid TS, equal to 45 minutes. Lift the basket from the fluid, and observe the Tablets: all of the Tablets have disintegrated completely. If 1 or 2 Tablets fail to disintegrate completely, repeat the test on 12 additional Tablets: not less than 16 of the total of 18 Tablets tested disintegrate completely.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Internal standard solution**—Transfer about 20 mg of USP Propylparaben RS to a 50-mL volumetric flask, dissolve in and dilute with alcohol to volume, and mix.

**Standard preparation**—Dissolve in alcohol a suitable quantity of USP Chlorambucil RS, accurately weighed, and prepare, by quantitative dilution, a solution in alcohol having a

known concentration of about 1 mg per mL. Transfer 2.0 mL of the solution to a 100-mL volumetric flask containing about 50 mL of alcohol and, while gently swirling, add 5.0 mL of 0.1 N hydrochloric acid and 2.0 mL of *Internal standard solution*. Dilute with alcohol to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2 mg of chlorambucil, to a 100-mL volumetric flask containing about 50 mL of alcohol and, while gently swirling, add 5.0 mL of 0.1 N hydrochloric acid and 2.0 mL of *Internal standard solution*. Sonicate for 5 minutes, dilute with alcohol to volume, and mix. Filter through a medium-porosity, sintered-glass filtering funnel, maintaining reduced pressure for the minimum necessary time in order to avoid solvent loss of evaporation.

**Mobile phase**—Mix 500 mL of alcohol with 1.0 mL of glacial acetic acid in a 1-liter volumetric flask, dilute with water to volume, and mix. The alcohol concentration may be varied to meet system suitability requirements and to provide a suitable elution time for chlorambucil. Degas the solution at a pressure of approximately 250 mm of mercury for 2 minutes.

**Chromatographic system**—Typically, a high-pressure liquid chromatograph, operated at room temperature, is fitted with a 25- or 30-cm × 2-mm stainless steel column packed with spherical silica microbeads, 5 μm to 10 μm in diameter, to which is bonded a nominal 10% or 20% (w/w) octadecyl silane. The mobile phase is maintained at a flow rate capable of giving the required resolution (see *System suitability test*) and a suitable elution time. An UV detector that monitors absorption at the 254-nm wavelength is used.

**System suitability test**—Chromatograph 6 to 10 injections of the *Standard preparation*, and measure the peak responses as directed under *Procedure*. Calculate the response factor, *P<sub>S</sub>*, and the resolution factor, *R* (see *Chromatography* (621)). The response factor for 6 to 8 injections does not vary by more than 2.0% relative standard deviation and the resolution factor is not less than 2.0.

**Procedure**—Introduce equal volumes (10 to 12 μL) of the *Standard preparation* and the *Assay preparation* into the high-pressure liquid chromatograph by means of a suitable sampling valve or high-pressure microsyringe, and measure the peak responses at identical retention times obtained with each preparation. Calculate the quantity, in mg, of C<sub>14</sub>H<sub>19</sub>Cl<sub>2</sub>NO<sub>2</sub> in the portion of Tablets taken by the formula:

$$0.1C(P_U / P_S)$$

in which *C* is the concentration, in μg per mL, of USP Chlorambucil RS in the *Standard preparation*, and *P<sub>U</sub>* and *P<sub>S</sub>* are the response factors of the *Assay preparation* and the *Standard preparation*, respectively.

## Chloramphenicol

C<sub>11</sub>H<sub>12</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>5</sub> 323.13

Acetamide, 2,2-dichloro-*N*-[2-hydroxy-1-(hydroxymethyl)-2-(4-nitrophenyl)ethyl]-, [*R*-(*R*<sup>\*</sup>, *R*<sup>\*</sup>)]-

*D*-threo-(-)-2,2-Dichloro-*N*-[β-hydroxy-α-(hydroxymethyl)-*p*-nitrophenethyl]acetamide [56-75-7].

» Chloramphenicol contains not less than 97.0 percent and not more than 103.0 percent of C<sub>11</sub>H<sub>12</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>5</sub>.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable or other sterile dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable or other sterile dosage forms.

**USP Reference standards** (11)—

USP Chloramphenicol RS

USP Endotoxin RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Melting range** (741): between 149° and 153°.

**Specific rotation** (781S): between +17.0° and +20.0°.

*Test solution:* 50 mg, undried, per mL, in dehydrated alcohol.

**Crystallinity** (695): meets the requirements.

**Bacterial endotoxins** (85)—Where Chloramphenicol is intended for use in preparing injectable dosage forms, it contains not more than 0.2 USP Endotoxin Unit per mg of chloramphenicol.

**Sterility** (71)—Where the label states that Chloramphenicol is sterile, it meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, except to use 1 g of solid specimen.

**pH** (791): between 4.5 and 7.5, in an aqueous suspension containing 25 mg per mL.

**Chromatographic purity**—Dissolve an accurately weighed quantity of Chloramphenicol in methanol to obtain a test solution containing 10 mg per mL. Prepare a solution of USP Chloramphenicol RS in methanol containing 10 mg per mL (*Standard solution A*). Dilute portions of *Standard solution A* quantitatively with methanol to obtain *Standard solution B* containing 100 µg per mL and *Standard solution C* containing 50 µg per mL. Apply separate 20-µL portions of the test solution and *Standard solutions B* and *C* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of chloroform, methanol, and glacial acetic acid (79:14:7) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, air-dry, and examine under short-wavelength UV light: any spot other than the principal spot obtained from the test solution does not exceed in size or intensity the principal spot obtained from *Standard solution B* (1%), and the sum of the impurities represented by all of the spots other than the principal spot, based on a comparison of the intensities of such spots with the intensities of the principal spots obtained from *Standard solutions B* and *C*, does not exceed 2%.

**Assay**—

*Mobile phase*—Prepare a suitable filtered mixture of water, methanol, and glacial acetic acid (55:45:0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chloramphenicol RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 80 µg per mL. Filter a portion of this solution through a 0.5-µm or finer porosity filter, and use the clear filtrate as the *Standard preparation*.

*Assay preparation*—Transfer about 200 mg of Chloramphenicol, accurately weighed, to a 100-mL volumetric flask, add *Mobile phase* to volume, and mix. Transfer 4.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of

this solution through a 0.5-µm or finer porosity filter, and use the clear filtrate as the *Assay preparation*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 10-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the analyte peak is not less than 1800 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 1.0%.

*Procedure*—[NOTE—Use peak heights where peak responses are indicated.] Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>11</sub>H<sub>12</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>5</sub> in the portion of Chloramphenicol taken by the formula:

$$2.5C(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Chloramphenicol RS in the *Standard preparation*, and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chloramphenicol Capsules

» Chloramphenicol Capsules contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of C<sub>11</sub>H<sub>12</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>5</sub>.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Chloramphenicol RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Dissolution** (711)—

*Medium:* 0.01 N hydrochloric acid; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 30 minutes.

*Procedure*—Determine the amount of C<sub>11</sub>H<sub>12</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>5</sub> dissolved by employing UV absorption at the wavelength of maximum absorbance at about 278 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Chloramphenicol RS in the same *Medium*.

*Tolerances*—Not less than 85% (Q) of the labeled amount of C<sub>11</sub>H<sub>12</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>5</sub> is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Mobile phase* and *Chromatographic system*—Proceed as directed in the *Assay* under *Chloramphenicol*.

*Standard preparation*—Transfer about 25 mg of USP Chloramphenicol RS, accurately weighed, to a 200-mL volumetric flask, add 10 mL of water, and heat on a steam bath until completely dissolved. Cool to room temperature, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5-µm or finer porosity filter, and use the clear filtrate as the *Standard preparation*.

*Assay preparation*—Transfer an accurately counted number of Chloramphenicol Capsules, equivalent to about

2500 mg of chloramphenicol, to a 1000-mL volumetric flask, add 100 mL of water, and heat on a steam bath until the Capsules have disintegrated. Add 300 mL of water, and heat on a steam bath for 20 minutes, with occasional mixing. Cool to room temperature, dilute with water to volume, and mix. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Assay preparation*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Chloramphenicol*. Calculate the quantity, in mg, of  $C_{11}H_{12}Cl_2N_2O_5$  in each Capsule taken by the formula:

$$20(C / N)(r_u / r_s)$$

in which *N* is the number of Capsules taken, and the other terms are as defined therein.

## Chloramphenicol Cream

» Chloramphenicol Cream contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of  $C_{11}H_{12}Cl_2N_2O_5$ .

**Packaging and storage**—Preserve in collapsible tubes or in tight containers.

**USP Reference standards** (11)—

USP Chloramphenicol RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Minimum fill** (755): meets the requirements.

**Assay**—

*Mobile phase* and *Chromatographic system*—Proceed as directed in the *Assay* under *Chloramphenicol*.

*Standard preparation*—Transfer about 40 mg of USP Chloramphenicol RS, accurately weighed, to a 100-mL volumetric flask, dissolve in methanol, dilute with methanol to volume, and mix. Transfer 10.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Standard preparation*.

*Assay preparation*—Transfer an accurately weighed quantity of Chloramphenicol Cream, equivalent to about 40 mg of chloramphenicol, to a 100-mL volumetric flask, add about 80 mL of methanol, and sonicate for about 10 minutes. Cool to room temperature, dilute with methanol to volume, and mix. Transfer 10.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Assay preparation*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Chloramphenicol*. Calculate the quantity, in mg, of  $C_{11}H_{12}Cl_2N_2O_5$  in the portion of Cream taken by the formula:

$$0.5C(r_u / r_s)$$

in which the terms are as defined therein.

## Chloramphenicol Injection

» Chloramphenicol Injection is a sterile solution of Chloramphenicol in one or more suitable solvents. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of  $C_{11}H_{12}Cl_2N_2O_5$ . It may contain suitable buffers.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Chloramphenicol RS

USP Endotoxin RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.2 USP Endotoxin Unit per mg of chloramphenicol.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, 1 mL from each container being transferred directly to the membrane filter.

**pH** (791): between 5.0 and 8.0, in a solution diluted with water (1:1).

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Mobile phase*, *Standard preparation*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Chloramphenicol*.

*Assay preparation*—Transfer an accurately measured volume of Chloramphenicol Injection, equivalent to about 200 mg of chloramphenicol, to a 100-mL volumetric flask, add *Mobile phase* to volume, and mix. Transfer 4.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter this solution through a 0.5- $\mu$ m or finer porosity filter.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Chloramphenicol*. Calculate the quantity, in mg, of  $C_{11}H_{12}Cl_2N_2O_5$  in each mL of the Injection taken by the formula:

$$2.5(C / V)(r_u / r_s)$$

in which *V* is the volume, in mL, of Injection taken, and the other terms are as defined therein.

## Chloramphenicol Ophthalmic Ointment

» Chloramphenicol Ophthalmic Ointment contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of  $C_{11}H_{12}Cl_2N_2O_5$ .

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes.

**USP Reference standards** (11)—

USP Chloramphenicol RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to

that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Sterility** (71): meets the requirements.

**Minimum fill** (755): meets the requirements.

**Metal particles**—It meets the requirements under *Metal Particles in Ophthalmic Ointments* (751).

**Assay—**

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay* under *Chloramphenicol*.

*Standard preparation*—Transfer about 25 mg of USP Chloramphenicol RS, accurately weighed, to a 100-mL volumetric flask, dissolve in methanol, dilute with methanol to volume, and mix. Transfer 10.0 mL of the resulting solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Standard preparation*.

*Assay preparation*—Transfer an accurately weighed quantity of Ophthalmic Ointment, equivalent to about 25 mg of chloramphenicol, to a suitable conical flask, add 20 mL of cyclohexane, mix, and sonicate for about 2 minutes. Add 60 mL of methanol, and mix. Filter this mixture, collecting the filtrate in a 100-mL volumetric flask. Wash the filter with methanol, collecting the washings in the volumetric flask. Dilute with methanol to volume, and mix. Transfer 50.0 mL of the resulting solution to a suitable round-bottom flask, and evaporate to dryness by rotating the flask under vacuum in a water bath at 35°. Dissolve the residue in 50.0 mL of methanol. Transfer 10.0 mL of the resulting solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Chloramphenicol*. Calculate the quantity, in mg, of  $C_{11}H_{12}Cl_2N_2O_5$  in the portion of Ophthalmic Ointment taken by the formula:

$$0.25C(r_u / r_s)$$

in which the terms are as defined therein.

## Chloramphenicol Ophthalmic Solution

» Chloramphenicol Ophthalmic Solution is a sterile solution of Chloramphenicol. It contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of  $C_{11}H_{12}Cl_2N_2O_5$ .

**Packaging and storage**—Preserve in tight containers, and store in a refrigerator until dispensed. The containers or individual cartons are sealed and tamper-proof so that sterility is assured at time of first use.

**Labeling**—The labeling states that there is a 21-day beyond-use period after dispensing.

**USP Reference standards** (11)—  
USP Chloramphenicol RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 7.0 and 7.5, except that in the case of Ophthalmic Solution that is unbuffered or is labeled for veterinary use it is between 3.0 and 6.0.

**Assay—**

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay* under *Chloramphenicol*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chloramphenicol RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 100  $\mu$ g per mL. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Standard preparation*.

*Assay preparation*—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 50 mg of chloramphenicol, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of the resulting solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Chloramphenicol*. Calculate the quantity, in mg, of  $C_{11}H_{12}Cl_2N_2O_5$  in each mL of the Ophthalmic Solution taken by the formula:

$$0.5(C / V)(r_u / r_s)$$

in which *V* is the volume, in mL, of Ophthalmic Solution taken, and the other terms are as defined therein.

## Chloramphenicol for Ophthalmic Solution

» Chloramphenicol for Ophthalmic Solution is a sterile, dry mixture of Chloramphenicol with or without one or more suitable buffers, diluents, and preservatives. It contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of  $C_{11}H_{12}Cl_2N_2O_5$ , when constituted as directed.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—If packaged in combination with a container of solvent, label it with a warning that it is not for injection.

**USP Reference standards** (11)—  
USP Chloramphenicol RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 7.1 and 7.5, in an aqueous solution containing 5 mg of chloramphenicol per mL.

**Assay—**

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay* under *Chloramphenicol*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chloramphenicol RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 100  $\mu$ g per mL. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Standard preparation*.

**Assay preparation**—Transfer the contents of 1 container of Chloramphenicol for Ophthalmic Solution to a suitable container with the aid of *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a concentration of about 100 µg of chloramphenicol per mL. Filter a portion of this solution through a 0.5-µm or finer porosity filter, and use the clear filtrate as the *Assay preparation*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay under Chloramphenicol*. Calculate the quantity, in mg, of  $C_{11}H_{12}Cl_2N_2O_5$  in the container of Chloramphenicol for Ophthalmic Solution taken by the formula:

$$(L / D)C(r_u / r_s)$$

in which *L* is the labeled quantity, in mg, of chloramphenicol in the container, *D* is the concentration, in µg per mL, of chloramphenicol in the *Assay preparation*, based on the labeled quantity and the extent of dilution, and the other terms are as defined therein.

## Chloramphenicol Oral Solution

» Chloramphenicol Oral Solution is a solution of Chloramphenicol in a suitable solvent. It contains one or more suitable buffers and preservatives. It has a potency of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{11}H_{12}Cl_2N_2O_5$ .

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate that it is for veterinary use only and that it is not to be used in animals raised for food production.

**USP Reference standards** (11)—  
USP Chloramphenicol RS

**Identification**—Prepare a *Test solution* containing 20 µg per mL chloramphenicol from Oral Solution diluted with water. The ultraviolet absorption spectrum of the *Test solution* exhibits maxima and minima only at the same wavelength as that of a similar solution of USP Chloramphenicol RS, concomitantly measured.

**pH** (791): between 5.0 and 8.5, when diluted with an equal volume of water.

**Assay**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Oral Solution diluted quantitatively and stepwise with water to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Chloramphenicol Otic Solution

» Chloramphenicol Otic Solution is a sterile solution of Chloramphenicol in a suitable solvent. It contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of  $C_{11}H_{12}Cl_2N_2O_5$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—  
USP Chloramphenicol RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to

that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 4.0 and 8.0, when diluted with an equal volume of water.

**Water, Method I** (921): not more than 2.0%.

**Assay**—

*Mobile phase* and *Chromatographic system*—Proceed as directed in the *Assay under Chloramphenicol*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chloramphenicol RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 100 µg per mL. Filter a portion of this solution through a 0.5-µm or finer porosity filter, and use the clear filtrate as the *Standard preparation*.

*Assay preparation*—Transfer an accurately measured volume of Otic Solution, equivalent to about 50 mg of chloramphenicol, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of the resulting solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5-µm or finer porosity filter, and use the clear filtrate as the *Assay preparation*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay under Chloramphenicol*. Calculate the quantity, in mg, of  $C_{11}H_{12}Cl_2N_2O_5$  in each mL of the Otic Solution taken by the formula:

$$0.5(C / V)(r_u / r_s)$$

in which *V* is the volume, in mL, of Otic Solution taken, and the other terms are as defined therein.

## Chloramphenicol Tablets

» Chloramphenicol Tablets contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{11}H_{12}Cl_2N_2O_5$ .

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label Tablets to indicate that they are for veterinary use only and are not to be used in animals raised for food production.

**USP Reference standards** (11)—  
USP Chloramphenicol RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Disintegration** (701): 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Mobile phase* and *Chromatographic system*—Proceed as directed in the *Assay under Chloramphenicol*.

*Standard preparation*—Transfer about 25 mg of USP Chloramphenicol RS, accurately weighed, to a 200-mL volumetric flask, add 10 mL of water, and heat on a steam bath until completely dissolved. Cool to room temperature, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5-µm or finer porosity filter, and use the clear filtrate as the *Standard preparation*.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of

the powder, equivalent to about 500 mg of chloramphenicol, to a 200-mL volumetric flask, add 80 mL of water, and heat on a steam bath for 20 minutes, with occasional mixing. Cool to room temperature, dilute with water to volume, and mix. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Assay preparation*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Chloramphenicol*. Calculate the quantity, in mg, of  $C_{11}H_{12}Cl_2N_2O_5$  in the portion of Tablets taken by the formula:

$$4C(r_U / r_S)$$

in which the terms are as defined therein.

### Chloramphenicol and Hydrocortisone Acetate for Ophthalmic Suspension

» Chloramphenicol and Hydrocortisone Acetate for Ophthalmic Suspension is a sterile, dry mixture of Chloramphenicol and Hydrocortisone Acetate with or without one or more suitable buffers, diluents, and preservatives. It contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ), and not less than 90.0 percent and not more than 115.0 percent of the labeled amount of hydrocortisone acetate ( $C_{23}H_{32}O_6$ ), when constituted as directed.

**Labeling**—If packaged in combination with a container of solvent, label it with a warning that it is not for injection.

#### USP Reference standards (11)—

USP Chloramphenicol RS

USP Hydrocortisone Acetate RS

**Identification**—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 7.1 and 7.5, in an aqueous suspension containing 5 mg of chloramphenicol per mL.

#### Assay—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay* under *Chloramphenicol*.

**Standard preparation**—Transfer about 37.5 mg of USP Chloramphenicol RS and 37.5 mg of USP Hydrocortisone Acetate RS, both accurately weighed, *I* being the ratio of the labeled amount, in mg, of hydrocortisone acetate to the labeled amount, in mg, of chloramphenicol in the Chloramphenicol and Hydrocortisone Acetate for Ophthalmic Solution, to a 100-mL volumetric flask, add 15 mL of water and 75 mL of methanol, sonicate for a few seconds, dilute with methanol to volume, and mix. Transfer 5.0 mL of the resulting solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Standard preparation*.

**Assay preparation**—Transfer the contents of an accurately counted number of containers of Chloramphenicol and Hydrocortisone Acetate for Ophthalmic Solution, equivalent to about 37.5 mg of chloramphenicol, to a 100-mL volumetric

flask with the aid of 5 mL of water for each 12.5 mg of chloramphenicol contained therein. Wash each container with methanol, and add the washings to the volumetric flask. Dilute with methanol to volume, and mix. Transfer 5.0 mL of the resulting solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Assay preparation*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Chloramphenicol*. Calculate the quantity, in mg, of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ) in each container taken by the formula:

$$0.5(C / N)(r_U / r_S)$$

in which *N* is the number of containers taken, and the other terms are as defined therein. Calculate the quantity, in mg, of hydrocortisone acetate ( $C_{23}H_{32}O_6$ ) in each container taken by the formula:

$$500(C / N)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Hydrocortisone Acetate RS in the *Standard preparation*, *N* is the number of containers taken, and *r<sub>U</sub>* and *r<sub>S</sub>* are the hydrocortisone acetate peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Chloramphenicol and Polymyxin B Sulfate Ophthalmic Ointment

» Chloramphenicol and Polymyxin B Sulfate Ophthalmic Ointment contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ) and not less than 90.0 percent and not more than 125.0 percent of the labeled amount of polymyxin B.

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes.

#### USP Reference standards (11)—

USP Chloramphenicol RS

USP Polymyxin B Sulfate RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay for chloramphenicol*.

**Sterility** (71): meets the requirements.

**Metal particles**—It meets the requirements of the test for *Metal Particles in Ophthalmic Ointments* (751).

#### Assay for chloramphenicol—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay* under *Chloramphenicol*.

**Standard preparation**—Proceed as directed for *Standard preparation* in the *Assay* under *Chloramphenicol Ophthalmic Ointment*.

**Assay preparation**—Using Ophthalmic Ointment, proceed as directed for *Assay preparation* in the *Assay* under *Chloramphenicol Ophthalmic Ointment*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Chloramphenicol*. Calculate the quantity, in mg, of  $C_{11}H_{12}Cl_2N_2O_5$  in the portion of Ophthalmic Ointment taken by the formula:

$$0.25C(r_U / r_S)$$

in which the terms are as defined therein.

**Assay for polymyxin**—Proceed as directed for polymyxin under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Ophthalmic Ointment, equivalent to about 5000 Polymyxin B Units, shaken in a separator containing about 50 mL of ether and extracted with four 20-mL portions of *Buffer No. 6*. Combine the aqueous extracts in a 100-mL volumetric flask, dilute with *Buffer No. 6* to volume, and mix. Dilute an accurately measured portion of this solution quantitatively with *Buffer No. 6* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

### Chloramphenicol, Polymyxin B Sulfate, and Hydrocortisone Acetate Ophthalmic Ointment

» Chloramphenicol, Polymyxin B Sulfate, and Hydrocortisone Acetate Ophthalmic Ointment contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ), not less than 90.0 percent and not more than 125.0 percent of the labeled amount of polymyxin B, and not less than 90.0 percent and not more than 115.0 percent of the labeled amount of hydrocortisone acetate ( $C_{23}H_{32}O_6$ ).

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes.

**USP Reference standards** (11)—

USP Chloramphenicol RS

USP Polymyxin B Sulfate RS

USP Hydrocortisone Acetate RS

**Identification**—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation* as obtained in the *Assay for chloramphenicol and hydrocortisone acetate*.

**Sterility** (71): meets the requirements.

**Minimum fill** (755): meets the requirements.

**Metal particles**—It meets the requirements under *Metal Particles in Ophthalmic Ointments* (751).

**Assay for polymyxin**—Proceed with Ophthalmic Ointment as directed for polymyxin under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Ophthalmic Ointment, equivalent to about 5000 Polymyxin B Units, shaken in a separator containing about 50 mL of ether and extracted with four 20-mL portions of *Buffer No. 6*. Combine the aqueous extracts in a 100-mL volumetric flask, dilute, if necessary, with *Buffer No. 6* to volume, and mix. Dilute an accurately measured portion of the resulting solution quantitatively with *Buffer No. 6* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

**Assay for chloramphenicol and hydrocortisone acetate**—

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay under Chloramphenicol*.

*Standard preparation*—Transfer about 25 mg of USP Chloramphenicol RS and 25J mg of USP Hydrocortisone Acetate RS, both accurately weighed, *J* being the ratio of the labeled amount, in mg, of hydrocortisone acetate to the labeled amount, in mg, of chloramphenicol per g of Ophthalmic Ointment, to a 100-mL volumetric flask, dissolve in methanol, dilute with methanol to volume, and mix. Transfer 10.0 mL of the resulting solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and

mix. Filter a portion of this solution through a 0.5- $\mu$ m or finer porosity filter, and use the clear filtrate as the *Standard preparation*.

*Assay preparation*—Using Ophthalmic Ointment, proceed as directed for *Assay preparation* in the *Assay under Chloramphenicol Ophthalmic Ointment*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay under Chloramphenicol*. Calculate the quantity, in mg, of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ) in the portion of Ophthalmic Ointment taken by the formula:

$$0.25C(r_U / r_S)$$

in which the terms are as defined therein. Calculate the quantity, in mg, of hydrocortisone acetate ( $C_{23}H_{32}O_6$ ) in the portion of Ophthalmic Ointment taken by the formula:

$$250C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Hydrocortisone Acetate RS in the *Standard preparation*, and the other terms are as defined therein.

### Chloramphenicol and Prednisolone Ophthalmic Ointment

» Chloramphenicol and Prednisolone Ophthalmic Ointment contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ), and not less than 90.0 percent and not more than 115.0 percent of the labeled amount of prednisolone ( $C_{21}H_{28}O_5$ ).

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes.

**USP Reference standards** (11)—

USP Chloramphenicol RS

USP Prednisolone RS

**Identification**—

**A:** Transfer a quantity of Ophthalmic Ointment, equivalent to about 20 mg of chloramphenicol, to a screw-capped test tube, add 5 mL of 5 N sodium hydroxide and 2 mL of pyridine, and shake. Place the tube in a water bath at 50° for 20 minutes: a reddish brown color develops in the pyridine layer.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay for chloramphenicol*.

**C:** Transfer a quantity of Ophthalmic Ointment, equivalent to about 1.5 mg of prednisolone, to a screw-capped test tube, add 10 mL of methylene chloride, and shake to disperse. Heat at 60° for 15 minutes, and allow to cool while shaking for about 30 minutes. Allow to separate, draw off the upper ointment layer, and retain the lower methylene chloride layer. Apply, in portions, 0.4 mL each of the methylene chloride test solution and a Standard solution of USP Prednisolone RS in chloroform containing 0.5 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow each portion to dry before adding the next portion to the same spot. Develop the chromatogram in a chromatographic chamber lined with paper and equilibrated with a solvent system consisting of a mixture of chloroform and acetone (4:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber,

mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the *Test solution* corresponds to that obtained from the *Standard solution*.

**Sterility** (71): meets the requirements.

**Minimum fill** (755): meets the requirements.

**Metal particles**—It meets the requirements under *Metal Particles in Ophthalmic Ointments* (751).

#### Assay for chloramphenicol—

*Methanol-water solution and Mobile phase*—Proceed as directed in the *Assay for prednisolone*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chloramphenicol RS in *Methanol-water solution* to obtain a solution having a known concentration of about 0.3 mg per mL.

*Assay preparation*—Transfer an accurately weighed portion of Ophthalmic Ointment, equivalent to about 3.0 mg of chloramphenicol, to a screw-capped test tube. Add 10 mL of *n*-heptane, and shake by mechanical means until the substance is dissolved. Add 10.0 mL of *Methanol-water solution*, and shake by mechanical means for 30 seconds. Allow the layers to separate, and carefully remove the upper phase. Centrifuge the lower phase for 15 minutes, and use the clear portion as the *Assay preparation*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the peak for chloramphenicol obtained from the Ophthalmic Ointment, at a retention time corresponding to that of the peak obtained from the Reference Standard, exhibits baseline separation from the adjacent prednisolone peak, and the relative standard deviation of replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{11}H_{12}Cl_2N_2O_5$  in the portion of Ophthalmic Ointment taken by the formula:

$$10C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Chloramphenicol RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for prednisolone—

*Methanol-water solution*—Mix 4 volumes of methanol with 1 volume of water, and mix.

*Mobile phase*—Dissolve 0.68 g of sodium acetate trihydrate in 400 mL of water in a 1000-mL graduated cylinder, adjust with glacial acetic acid to a pH of 4.0, and dilute with water to 500 mL. Dilute with methanol to 1000 mL, and mix. Filter this solution through a membrane filter (1  $\mu$ m or finer porosity), and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Prednisolone RS in *Methanol-water solution* to obtain a solution having a known concentration of about 0.2 mg per mL.

*Assay preparation*—Transfer an accurately weighed portion of Ophthalmic Ointment, equivalent to about 2.0 mg of Prednisolone, to a screw-capped test tube. Add 10 mL of *n*-heptane, and shake by mechanical means until the substance is dissolved. Add 10.0 mL of *Methanol-water solution*, and shake by mechanical means for 30 seconds. Allow the layers to separate, and carefully remove the upper phase. Centrifuge the lower phase for 15 minutes, and use the clear portion as the *Assay preparation*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the peak for prednisolone obtained from the Ophthalmic Ointment, at a retention time corresponding to that of the peak obtained from the *Reference Standard*, exhibits baseline separation from the adjacent chloramphenicol peak, and the relative standard deviation of replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 15  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{21}H_{28}O_5$  in the portion of Ophthalmic Ointment taken by the formula:

$$10C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Prednisolone RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chloramphenicol Palmitate

$C_{27}H_{42}Cl_2N_2O_6$  561.54

Hexadecanoic acid, 2-[(2,2-dichloroacetyl)amino]-3-hydroxy-3-(4-nitrophenyl)propyl ester, [ $R$ -( $R^*$ ,  $R^*$ )]-, *D*-threo-(-)-2,2-Dichloro-*N*-[ $\beta$ -hydroxy- $\alpha$ -(hydroxymethyl)-*p*-nitrophenethyl]acetamide  $\alpha$ -palmitate [530-43-8].

» Chloramphenicol Palmitate has a potency equivalent to not less than 555  $\mu$ g and not more than 595  $\mu$ g of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ) per mg.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Chloramphenicol Palmitate RS

**Identification**—The retention time of the chloramphenicol palmitate peak in the chromatogram of the *Assay preparation* corresponds to that of the chloramphenicol palmitate peak in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Melting range** (741): between 87° and 95°.

**Specific rotation** (781S): between +21° and +25°.

*Test solution*: 50 mg, undried, per mL, in dehydrated alcohol.

**Crystallinity** (695): meets the requirements.

**Loss on drying** (731)—Dry it to constant weight over phosphorus pentoxide in vacuum at a pressure not exceeding 5 mm of mercury: it loses not more than 0.5% of its weight.

**Acidity**—Dissolve 1.0 g by heating at 35° with 5 mL of a 1:1 mixture of 80 percent alcohol and ether, previously neutralized using phenolphthalein TS. Titrate with 0.1 N sodium hydroxide VS, using phenolphthalein TS, until on gentle shaking a pink color persists for not less than 30 seconds: not more than 0.4 mL is consumed.

**Free chloramphenicol**—Dissolve 1.0 g in 80 mL of xylene with the aid of gentle warming. Cool, and extract with three 15-mL portions of water, combining the aqueous extracts and discarding the xylene. Dilute the combined aqueous extracts with water to 50 mL, extract with 10 mL of toluene, allow to separate, and discard the toluene. Centrifuge a portion of the aqueous solution, and determine the absorbance of the clear solution at the wavelength of maxi-

mum absorbance at about 278 nm, using a suitable spectrophotometer, and using as a reagent blank to set the instrument to zero the solution obtained by the same procedure without the specimen: the absorbance is not more than 0.268 (0.045%).

#### Assay—

**Mobile phase**—Prepare a suitable degassed mixture of methanol, water, and glacial acetic acid (172:27:1).

**Standard preparation**—Transfer about 65 mg of USP Chloramphenicol Palmitate RS to a 50-mL volumetric flask, add about 40 mL of methanol and 1 mL of glacial acetic acid, and sonicate for a few minutes. Dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Using about 65 mg of Chloramphenicol Palmitate, accurately weighed, prepare as directed under *Standard preparation*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 30-cm column that contains 10-μm packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the analyte peak is not less than 2400 theoretical plates, and the relative standard deviation for replicate injections is not more than 0.5%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in μg, of chloramphenicol (C<sub>11</sub>H<sub>12</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>5</sub>) equivalent in each mg of specimen taken by the formula:

$$(W_S / W_U)(P_S)(r_U / r_S)$$

in which  $W_S$  and  $W_U$  are the quantities, in mg, of USP Chloramphenicol Palmitate RS and Chloramphenicol Palmitate taken, respectively;  $P_S$  is the designated chloramphenicol equivalent, in μg per mg, of USP Chloramphenicol Palmitate RS; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chloramphenicol Palmitate Oral Suspension

» Chloramphenicol Palmitate Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloramphenicol (C<sub>11</sub>H<sub>12</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>5</sub>). It contains one or more suitable buffers, colors, flavors, preservatives, and suspending agents.

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards <11>—

USP Chloramphenicol Palmitate RS

USP Chloramphenicol Palmitate Polymorph A RS

USP Chloramphenicol Palmitate Nonpolymorph A RS

**Identification**—The retention time of the chloramphenicol palmitate peak in the chromatogram of the *Assay preparation* corresponds to that of the chloramphenicol palmitate peak in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Uniformity of dosage units <905>—

FOR SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** <698>: meets the requirements.

**pH** <791>: between 4.5 and 7.0.

#### Limit of polymorph A—

**Standard preparation**—Prepare a dry mixture of 1 part by weight of USP Chloramphenicol Palmitate Polymorph A RS and 9 parts by weight of USP Chloramphenicol Palmitate Nonpolymorph A RS. Prepare a 1 in 3 mineral oil dispersion of this mixture, and place a portion of it between two sodium chloride plates, taking care not to allow air bubbles to form.

**Test preparation**—Place 20 mL of previously mixed Oral Suspension in a 50-mL centrifuge tube, add 20 mL of water, and mix. Centrifuge, and discard the supernatant. Add 20 mL of water to the residue in the centrifuge tube, mix, centrifuge, and discard the supernatant. Repeat this washing two times. Dry the residue in vacuum over silica gel for not less than 14 hours. Prepare a 1 in 3 mineral oil dispersion of the dried residue, and place a portion of it between two sodium chloride plates, taking care not to allow air bubbles to form.
